An Employer Paid Personnel Service

SOFTWARE PROFESSIONALS

We are seeking creative programming wizards who have at least 2 years experience in assembly language and higher level language(s) (FORTRAN, COBOL, PL/I or BLISS). They should also have an understanding of indexed file structures and operating system logic related to I/O requests. Experience with or strong interest in data base management systems is a must. PDP-10 experience would be helpful, but is not required.

Responsibilities and job functions include design, implementation, maintenance and enhancement of software related to our CODASYL based DBMS. Pursuit of interests in other systems areas (e.g., compilers) is encouraged.

Excellent opportunity for professional and personal growth. Good benefit prorgram. Salary 16K - 25K commensurate with ability and experience.

Contact our personnel manager for appointment, or send resume to:

CompuServe
5000 Arlington Centre Blvd.
Columbus, Ohio 43220
An Equal Opportunity Employer M/F

SENIOR SOFTWARE ANALYST

At Warwick, Rhode Island where we will be installing a CICS System.

We are an international manufacturer of machinery seeking an individual who will assist in the installation of a CICS System. The person will also be responsible for modifying and maintaining our operating systems. (IBM-370-145, PDP 11/70).

A thorough understanding of ASSEMBLER (BAL) and a working knowledge of ANSI COBOL are essential. A related degree and, at least, four years manufacturing experience are required. Candidates who have DOS/VS CICS experience and exposure to an IBM operating environment will be given preference.

Send resume in confidence to G. Teich, Industrial Relations Department:

DIRECTOR, SYSTEMS DEVELOPMENT

Oberlin College, a private liberal arts college with a FTE of 2700 students, located southwest of Cleveland, is seeking a Director, Systems Development. The Director will be responsible for the supervision of personnel whose mission is to conceptualize, develop, test, document and maintain administrative systems. This position reports to the Director of Computing. Present equipment is a HONEYWELL Sigma 9 operating under CP-V.

QUALIFICATIONS: Demonstrated management and technical competence in the area of on-line administrative data base systems for a college or university environment using a large scale computer.

REQUIREMENTS: A master's degree, a minimum of six years experience in systems analysis and programming with at least two years in a supervisory position, and at least two years experience working with college or university administrative information systems. Significant experience beyond the minimum requirements may be substituted for the graduate degree.

SALARY: $15,100-$22,650 plus liberal employee benefits. Starting salary dependent upon experience and qualifications. Interested persons should submit resume by August 24, 1977 to: Marc M. Solomon, Oberlin College, Computing Center, Oberlin, Ohio, 44074. This position is to be filled by October 14, 1977 with the person reporting to work no later than November 14, 1977. *Affirmative Action (M/F) Equal Opportunity Employer.*

ACCOUNTING SOFTWARE FOR DEC RSTS/E CTS-500 USERS

From one of the pioneers in commercial data processing using RSTS. Successful installations in manufacturing, distribution, service bureau uses. Completely on-line, interactive systems. If you are installing or have installed a RSTS/E or CTS-500 system, contact us first for cost-effective solutions in: **ACCOUNTS PAYABLE; GENERAL LEDGER; FINANCIAL REPORTING**

The design specifications for these packages were developed by accountants for use by accountants. All packages provide excellent audit-trail, extensive user prompting, fast data entry, full file-maintenance and inquiry capabilities, modular design and construction.

These are consolidating packages and support multi-division company and multi-company corporate accounting functions.

For more information, contact us at:

Plycom services

General Ledger

In 1976 MSA'S General Ledger/ FICS System helped our clients keep track of more money than The U.S. Mint printed in the last 15 years.

If you'd like to find out how this system can help you in asset management, profit planning, cost and general accounting, call Marge Kimbrough at (404) 262-2376 or send us this coupon.

Calcomp means plotting

In all ways.

Everyone's plotting requirements are different. Problem? Not for CalComp. We have something for "everyone." The broadest product line anywhere...Plus...the in-field systems support and worldwide service to go with it. Plus more! More experience. More flexibility. More ways to go.

All ways, in fact. On-line. Remote/timesharing. Or off-line. You decide which is best for you—and then come to CalComp. The computer company that pioneered computer graphics now gives you the best of three worlds.

1. **On-line Plotting.** Give your calculator or minicomputer a new dimension. Let us expand its versatility, and give it broad graphics capability. Even broader with CalComp Software.
2. **Remote/Timesharing Plotting.** If your application requires low-cost high-quality plotting in a remote or timesharing environment, again CalComp has the answer. And a superior transmission line efficiency that reduces line time in the bargain.
3. **Off-line Plotting.** Talk about versatility, CalComp offers you the broadest matrix of off-line controllers and plotters available anywhere. Name it, we have it.

Remember. Whatever your plotting needs—on-line, remote/timesharing or off-line—CalComp has the solution. The widest choice of low-cost, high-performance systems—supported by dedicated software packages. And *Service.* And *Support.*

For answers to your specific plotting questions, contact your nearest CalComp sales office. See the plotting systems we've designed for you. To help you decide which is best for your application, just clip the coupon. We'll send you a free copy of an independent study by industry expert Ronald C. Derby on "Selecting Modes of Plotting."

DPressing!

Johnstown, Pa., flood victims are just beginning to dig themselves out from under the sludge left by a flood which hit nearly two weeks ago. Most DP installations still don't know the extent of their damage. See story on Page 2.

With Zero-Base Budgeting

Carter May End 'Closet' DP Funds

By Edith Holmes
CW Staff

WASHINGTON, D.C. — President Carter's plan to institute zero-base budgeting throughout the federal government will help end agencies' use of their DP budgets as "closets" in which to hide an extra million dollars or so, representatives of Arthur Young and Co. told a users group meeting here recently.

Zero-base budgeting — or ZBB — will pinpoint actual DP costs early in the budget process through which federal agencies must go, Charles B. Sheridan, a manager with Arthur Young, explained to the Federal ADP Users Group's (Fadpug) special interest group on ZBB and automated DP (ADP).

Like the rest of its agency, a federal DP installation must use this latest budget preparation technique to determine the lowest level of funding at which it can continue to deliver its program and services, Gerald Mendenhall of Arthur Young noted.

Full DP Evaluation

Under ZBB, all DP and other agency activities must be fully evaluated. The process works under the assumption that current operations are not necessarily essential and cost-effective, Mendenhall said.

Agencies must now do what many businesses are already doing: conduct systematic reviews of all their programs and services and rank them according to their importance and value to the organization's overall purpose, he stated.

Agency budget requests must now begin with necessities, move through "wants" and end with "wishes," Mendenhall suggested.

The Arthur Young executives predicted the first year of ZBB will be hardest on federal DP installations, not only because they must use the budget process to make their own funding requests, but they must also help the rest of their agencies understand and employ ZBB.

Sheridan showed 42 attendees at the meeting how one of Arthur Young's commercial clients used ZBB to distinguish between the levels of developmental programming and computer operations that were necessary to the organization's operation and those they had hopes of developing.

For example, in computer operations the organization began by noting that its current funding was $1.762 million. It projected a budget for the next year of $1.706 million, Sheridan said.

For this organization, the bare minimum of computer operation required was to keep its two IBM 370/155s up and running. For an additional $54,000, the DP manager said he would be able to increase the memory capacity on the 155s to a level sufficient to permit the development of interactive capability.

A third level with an additional sum of money would enable the organization to acquire a 370/138 that could be dedicated to interactive programming development.

In addition to employing ZBB to come up with its own budget, a federal DP installation must provide its agency's budget office with simulation capability to perform "what-if analyses" and cost-benefit studies, Sheridan said.

Agency line managers should be able to look to the DP organization for the capability of manipulating and ranking the levels of resources for which they are requesting funds. Ideally, managers should be able to use this DP service in an interactive mode,

CRTs Cause of Editors' Cataracts?

By Nancy French
And John P. Hebert
CW Staff

NEW YORK — Two copy editors who work for *The New York Times* were diagnosed as having cataracts after the newspaper switched to electronic editing and typesetting — a change that put the two in front of CRTs all day.

Both editors, who are in their 30s, suspect radiation emitted from the CRTs is to blame.

Cataract victims average 60 years of age, according to Dr. Edward Murphy Jr., a Boston opthalmologist affiliated with the Massachusetts Eye and Ear Infirmary who also teaches at Harvard Medical School.

The disease, which clouds the normally transparent lens of the eye and eventually causes blindness, can be corrected surgically by removing the lens and then adjusting vision with contact lenses and/or thick glasses.

Murphy said the disease is so unusual in people as young as 30 or 35 that when he finds such a case he usually looks for "some systemic disease such as diabetes."

Dr. Milton Zaret of Scarsdale, N.Y., an ophthalmologist and authority on the effects of radiation on the eye, said radiation could be to blame. Zaret was called in on the case after the Newspaper Guild of New York AFL-CIO intervened on behalf of the two copy editors.

At first *The Times* took the position that there was no connection between

Mass. Probing Pact Awards With Big Stakes

By Don Leavitt
CW Staff

BOSTON — Several investigations are probing the propriety of two major DP contracts let by the Commonwealth of Massachusetts since the beginning of the year.

The political stakes are enormous.

One of the contracts involves the reorganization and operation of much of the state's DP work, under a five-year facilities management arrangement, for a greatly expanded Department of Administration and Finance (A&F).

(Continued on Page 6)

We've Upgraded, Too

If you think *Computerworld* looks different, that's because it is. We have entered the age of computerized typesetting.

The entire paper has been redesigned to make it easier to read — new typefaces are used throughout, both in the regular body copy and in the headlines. All the sections now have distinctive "banners" to make them more identifiable.

In addition, a new section has been added to the paper. The new section on Microcomputing (See Page 37) will add coverage of the rapidly changing area of microcomputer use in both the hobby and small business areas to our regular sections.

The new type and headlines are made possible through the use of a computer-based composing system and a phototypesetter. The Quadex Corp. Typographer 2 linked to a Dymo Pacesetter replaces IBM MT/STs which we have rented — believe it or not — for 10 years.

The use of computers by a computer publication is nothing startling, but it certainly has given us some additional insight into the problems faced by users every day.

And even though the installation will give us a fund of "horror stories" to trade with users from now on, we hope the new look it gives *Computerworld* will increase your reading pleasure.

Salvage Attempts Under Way

Johnstown DP Loss Still Unknown

By Ann Dooley
CW Staff

JOHNSTOWN, Pa. — Rescue workers here are struggling to determine the extent of damage to computer equipment and installations in this area, which was hit by a surprise downpour and subsequent flood nearly two weeks ago.

Still hampered by virtually nonexistent communications, mountains of sludge and up to eight feet of water in some areas, service is almost at a standstill.

"We're trying to find out what condition the equipment is in, but some of the [installations] don't even exist anymore," an IBM spokeswoman said.

The flood, the second in the city's history, occurred after 10 inches of rain fell in seven hours, causing the Connemaugh River to overflow.

The day after the flood, an IBM emergency team was set up to try to locate and salvage as much equipment as possible. IBM field managers flew over the area to see what parts of the town sustained the most damage and to determine which customers would need the most help, the spokeswoman said.

The team found three IBM System 32s and one System 3/15B, but all appeared beyond repair, according to the spokeswoman. Two IBM mainframes known to be in Johnstown have not yet been accounted for and, because of the lack of communications, it is impossible to determine the number or condition of those affected in the outlying areas, she said.

Of the four computers that were submerged, all were housed on the first floor or in the basement, the spokeswoman said.

Hampered by Explosion

The rescue workers were making some progress until a gas explosion in a glass factory occurred, causing much of the town to be evacuated, the spokeswoman said.

Crown America, a distribution company here, was one of the few places the IBM rescue team could reach. Crown's System 3/15B was reported unsalvageable, but three data modules on which all customer information was stored have been saved.

The modules, stored in a safe believed to be airtight and waterproof, were soaked by the flood waters but IBM flew them to a center in San Jose, Calif., and 99% of the data was restored, the spokeswoman said.

IBM has leased a warehouse in the area and is sending emergency supplies of floppy disks and other equipment.

Other Vendors' Efforts

NCR Corp. is also organizing an emergency team, but since a written order is needed to enter Johnstown, which is now under martial law, the team has been unable to reach any customers, a spokesman said.

The NCR branch operations facility itself is reported to be under eight feet of water, although no computer equipment is in jeopardy. Many of the NCR installations in the area house their computers on second and third floors and should be out of danger, an NCR spokesman said.

Honeywell Corp. reported that none of its users' installations were affected because most were located on upper floors.

No one could estimate how much damage to computers and equipment has occurred, but the American Insurance Association has said that insured losses could exceed $42.5 million.

Cataracts Caused by CRTs?

(Continued from Page 1)

use of the CRTs and the two cataract diagnoses and that the men probably had cataracts before they began working on the CRTs. But 50 copy editors at *The Times* weren't so sure.

These editors signed a petition asking for an inquiry.

The Newspaper Guild asked the Manhattan Federal District Court to grant a temporary restraining order to take the two editors off the CRTs until new tests could be done.

Judge Thomas P. Griesa ruled the dispute should be settled through arbitration. A panel was selected and at the moment a representative sample of the machines in use at the newspaper is being tested for radiation "by an independent party," according to Harry Fisdell, vice-president of the guild.

Research done to date on the cataract-radiation problem is inconclusive. A study released May 13 by the National Institute of Occupational Safety and Health (Niosh) of Cincinnati stated that CRTs do not emit enough nonionizing radiation to pose an occupational hazard.

The study did acknowledge both copy editors have the type of cataracts "compatible with those reported from exposure to radiant energy."

However, the Niosh report has "fatal flaws," according to Zaret. Further, neither of the two men has "any significant medical history that would lead to the development of cataracts," he said.

Zaret, who has spent 20 years studying the effects of radiation on the eye, said the problems with color TV sets — which also contain cathode ray tubes — have been resolved, but CRT terminals are a "totally unexplored area."

"Deflection coils" which deflect the electronic beam onto the screen "create electromagnetic radiation as well as nonionizing radiation." These could produce cataracts, he said.

The terminals in use at *The Times* are largely Harris Corp. H-1520 CRTs, which create characters using a dot-matrix display, according to Gordon Kilgore, program manager for Harris' Composition Systems Division.

Nearly 1,000 of these terminals are now in use all over the world, Kilgore said, and no problems like this have ever been reported before.

CAVEAT

If you're about to become the *Emptor* of a sort product, benchmark it first!

(It's the best "warranty" you'll ever get.)

Call (201) 568-9700

Make a date with a free six-step sorting survey.

Datapro, we love you! We think that piece you published on "How to Buy Software Packages" contains some of the sagest advice since *Poor Richard's Almanac.*

If we had our way, we'd engrave the following excerpt on marble and put it in every computer center in the world:

> "Preparing and running benchmark tests on your computer system is by far the most convincing way to assure the selection of a software package."

Hear, hear! We couldn't agree more. In fact, we market SyncSort *only* via the benchmark route. Our free six-step sorting survey is about the safest "warranty" you'll ever get:

1. A technical presentation in your office.
2. Sort-load analysis.
3. Test outline.
4. On-site demonstration.
5. Tabulation of results.
6. Free testing period.

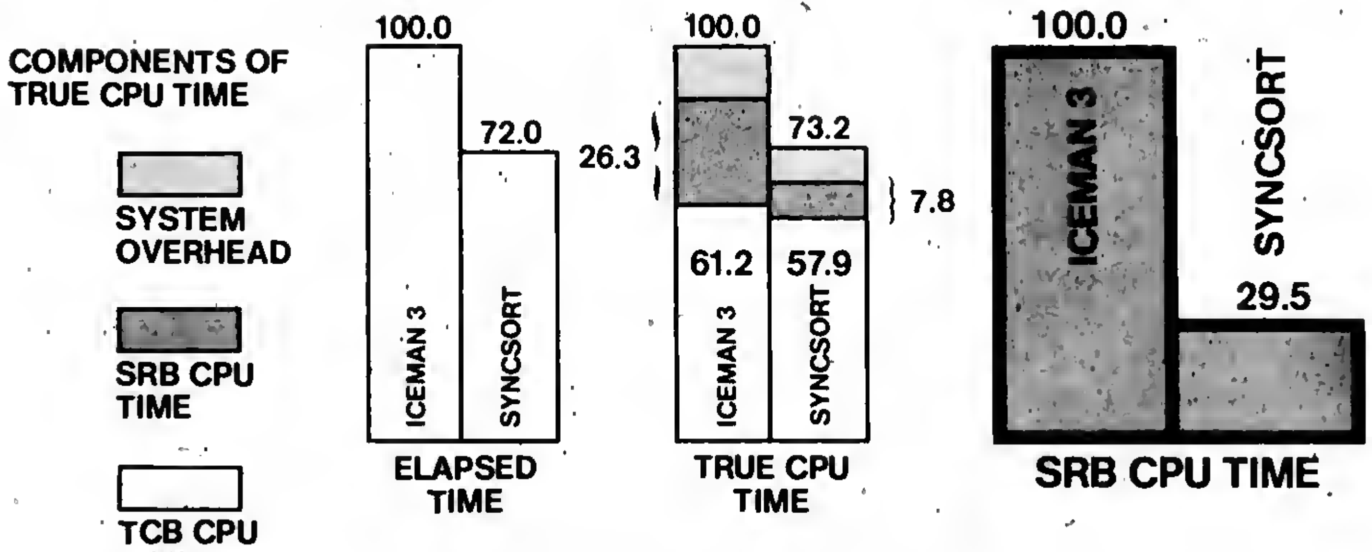
Not every sort vendor shares our passion for benchmarking. In fact, some of them view it as an opportunity to be carefully avoided. Like an all-expense vacation to Devil's Island.

The reasons are not hard to find. Benchmarking can be dangerous — to the health of a sort product that doesn't *really* perform. It can also be embarrassing — to the salesman who's trying to sell a born loser.

Take the incident that occurred a few weeks ago in a data-processing center that Must Remain Nameless.

In came a very nice, very upstanding IBM representative. His intent was to prove, once and for all, that IBM's new SM1-5740, Release 3, was superior to Whitlow's Sync-Sort III-and-a-half.

As the sun sank slowly in the west, the IBMer rolled up his sleeves and set to work. Benchmark followed benchmark. Hours passed. Results began to emerge. Inevitably, they looked like this:



By the time the poor fellow departed the premises, looking a bit crestfallen, even he was admitting that SyncSort was probably the data-processor's best bet.

It was one of the nicest recommendations we ever received!

Report Indicates Congress Erred

GAO Urges Study of Alternatives to 'Target'

By Edith Holmes
CW Staff

WASHINGTON, D.C. — The final version of a General Accounting Office (GAO) report on the Veterans Administration's (VA) proposed Target system suggests Congress erred in its recent decision to fund the controversial computerized claims-processing system for 1978.

After the House and Senate couldn't agree on the project, a conference committee meeting earmarked $18.4 million for the system for fiscal year 1978, even though committee members had in their hands the draft of the GAO report, which called the system "still a risky venture [CW, July 25].

"The costs and benefits of the proposed system and alternatives to it were not thoroughly evaluated. They should be," according to the final, "restricted" GAO report dated July 29, which was obtained here last week by *Computerworld.*

The GAO recommended Congress not permit the VA to award a contract for the $100.9 million system, which would cost an additional $12.5 million to operate each year, until the VA has set up measurable goals and standards for improving benefit claims services to veterans.

"Proponents of the Target system argue that the present benefit claims system is inefficient and that service to veterans is suffering," the GAO report noted. "Yet, VA had not established measurable goals or standards for improved service.

"In other words, VA had no basis for comparing alternative approaches and for determining whether systems less complex and less expensive than Target could do the job," the GAO concluded.

In fact, the administration proceeded with the development of Target without any economic analyses of alternative ways of meeting its benefit claims-processing needs, the report said.

Cost-Benefit Analyses

Major cost savings are possible with Target, but equally realistic are cost projections which exceed the system's monetary benefits when compared with the VA's current benefit claims-processing methods, the GAO study stated. The venture is thus "risky," Congress was told.

Even if the VA developed the necessary goals and standards for improved benefit service to veterans, as the GAO recommended, Congress should continue to hold up any contract award for Target until the VA produces a "definitive and complete" implementation plan for the system, the GAO said. That plan should resolve current uncertainties about the progress of development on Target, the costs involved and the implementation schedule for the system, the report added.

Cleland's Comments

The 75-page GAO report included comments by VA administrator Max Cleland, who agreed that measurable goals and standards for improving service to veterans are needed, but believes "the outstanding questions [concerning Target] have been satisfactorily resolved" and "the VA should proceed immediately with the necessary steps to make the Target system a reality at the earliest possible date."

Cleland stated that since he became VA administrator on March 2, he has given "top priority" to a thorough study and analysis of Target by himself and key VA officials.

He pledged the VA "will identify goals, objectives and performance standards for the Target system which will be quantified before installation, against which the system benefit improvements will be evaluated."

The GAO stated its belief that such measurements will need to be made in order to assess Target's success if it is implemented, but added this is not the action it had recommended. What GAO suggested was that the VA "establish, in measurable terms, goals and standards for improving benefit claims services to veterans *before* it can adequately determine what type of system it needs to meet those goals and standards at the least cost," the GAO report explained.

Cleland further contended that the revised system implementation schedule presented to the GAO and to Congress can be achieved with "very low risk of disrupted service to the veteran population" and that VA's analysis of the schedule "demonstrates conclusively that Target will be cost-beneficial."

The GAO, however, does not agree with Cleland's assertion that the revised schedule and related cost-benefit analysis resolve any of the uncertainties cited in its report about the progress of VA's development, its costs or its implementation.

The GAO inquiry into the cost-benefit justification of Target was originally requested by Representatives John E. Moss (D-Calif.) and Charles Rose (D-N.C.) in December 1975.

DPMA Fighting Software Tax

CHICAGO — The Data Processing Management Association (DPMA) has joined the battle against taxation of software and services now being waged in half a dozen states by pledging $1,400 to fund efforts in New York and Tennessee.

The results of those efforts will determine future action in other states where software and/or services are taxed, such as California and Wisconsin, according to George Eggert, head of the DPMA's Industry and Government Relations Committee.

The DPMA has retained Robert M. Sherin, president of Nova Computing Services, Inc. of Miami, to argue its case in an open hearing with New York State Tax Commissioner Thomas H. Lynch on Aug. 23.

The organization seeks to exempt software, services and telecommunications from taxation.

Seeking Funds

Eggert plans to issue a broad appeal for funds to finance the fight against software taxation; his proposal is currently under review of DPMA's legal staff, he indicated.

If the DPMA's involvement reaches the point of judicial action, Eggert said it must go back to the drawing board because Sherin is not an attorney. Hopefully there will be money in the fund to finance such action, he added.

Eggert called the DPMA the logical vehicle to wage the fight against software taxation, but admitted the group lost some momentum because it has "dragged its feet" since it first expressed interest in the issue [CW, May 16]. However, Eggert expects the movement will pick up.

THE NEW METHODOLOGY:

"SDM/70 is true state-of-the-art, with structured programming, HIPO and walkthroughs."

—William C. Rudd, Manager, Development and Support, Morton Norwich Products, Chicago

Bill finds that SDM/70 keeps his staff current with the latest technology; he reports, "We have the option to select the best IPT (improved programming technique) that fits the given project."

What is SDM/70? It's a comprehensive set of guidelines that steers a project team through the design of systems. SDM/70 covers all of the system life cycle phases, from initiation through the implementation phase and, for operational applications, including guidelines for post-implementation review and for maintenance-related work.

The SDM/70 structure includes five components: **Methods** guidelines that describe how each task of a given phase is to be performed; **Documentation** guidelines that describe how to orepare the documentation for a given phase; **Forms** guidelines that describe how to complete the SDM/70 forms; **Estimating** guidelines that describe how to estimate costs and schedules for the project (5 to 10% accuracy is now a reality), and **Administrative** guidelines that describe how to administer and control project activities.

To find out how SDM/70 can help you, call or write today.

UPC-Based Store Ordered to Price-Mark Items

By Ronald A. Frank
CW Staff

SALEM, Mass. — An automated supermarket checkout system has become the subject of a legal suit between the Massachusetts Attorney General's Consumer Protection Division and Purity Supreme, Inc. here.

The IBM 3660 supermarket system was installed by Purity Supreme in its Heartland warehouse store as part of a full scanning checkout system using the Universal Product Code (UPC).

The UPC is used with scanners at checkout terminals so bar-coded labels on grocery items automatically trigger a price lookup operation in a store's processor. When identifying data about an item is transmitted to a price data base in the computer, the price is displayed at the checkout terminal and printed on the customer's receipt tape.

In keeping with its warehouse image, the low-cost supermarket uses price marking only on shelves, not on individual items. The store gives customers grease pencils to mark items purchased if they feel prices are needed.

However, the consumer office of the Massachusetts Attorney General's office stepped in to require that Purity Supreme mark the price on each item in compliance with a state regulation that requires each item of food in a store to have a price on it.

Purity Supreme then filed a countermotion seeking to bar the state from enforcing the regulation. After hearing arguments by both sides in Middlesex Superior Court, Judge Alan Dimond last week issued a preliminary injunction against the supermarket chain, requiring that all items be price marked.

The Salem Heartland store has 12 automated checkout terminals; it stocks 2,500 items according to Timothy Goodburn, computer operations manager at Purity Supreme. The IBM 3660 has been operational since March.

Commenting on the possible abuses of such a system, Assistant Attorney General Paula Gold said "the real danger is that it is so much easier to change prices with a computerized checkout system. It is also easier just to increase prices because you don't have to reprice the item on the shelf."

According to figures from the supermarket chain, the annual cost to a customer to price each item is about $7 per year, and this is the minimal amount that the user will pay for having the prices, Gold said.

As soon as Judge Dimond issued his order in the case, the Consumer Protection Division planned to send someone to the Heartland store "to make sure they have actually put the prices on," she said. "I have every reason to believe that they will comply."

The next step in the legal proceeding is up to the company, according to Gold, and it has two options — to appeal the judge's ruling or to ask a trial on the merits of the case.

Purity Supreme officials said any comment would have to come from Leo Kahn, president, but Kahn could not be reached.

Most Customers Happy

Rudolph Kass, attorney for Purity Supreme, said the order to price mark items "is only a preliminary round. Of course we are disappointed and of course we will comply with the order of the court pending further proceedings."

Dimond's decision "was not a decision on the merits of the case" and Purity Supreme intends to pursue the issue on two fronts. First, it will proceed with the litigation; secondly, it will proceed with "administrative steps" to try to get changes in the state regulation, Kass said.

The company conducted a survey at the Salem store, he noted, and 96% of the customers "are pleased wth the system." Four percent said they would like to have items marketd.

Gold said she was not sure whether the initial complaint about a lack of prices at the Heartland store had come from a disgruntled shopper. But the Consumer Protection Division will enforce the state pricing regulation whenever a store is found eliminating item price marking, she said.

Kreps Defends Carter OTP Plan

WASHINGTON, D.C. — Secretary of Commerce Juanita Kreps has defended President Carter's move to reorganize the Office of Telecommunication Policy (OTP) and welcomed the opportunity to get into the national debate over communications policy.

"The reorganization plan calls for the appointment of an Assistant Secretary for Communications and Information, providing a clear indication of the significance that President Carter and I attach to communications issues," Kreps said in a recent statement here.

Many members of Congress criticized Carter's plan because they felt such a move will downgrade the OTP's visibililty [CW, July 25].

Under the President's plan, the Commerce Department will assume many of the functions previously performed by the OTP, Kreps said.

"We will be dealing with more than mere technical specifications and system configurations, we'll be addressing issues that will affect the ways people communicate and the matter in which the technology of communications is controlled," she stated.

ON - LINE PROGRAM MAINTENANCE FOR DOS and DOS/VS USERS

Shadow II has rightly gained the reputation as the industry leader in TP Monitor software.

Not only is is the fastest, most efficient and easiest-to-use TP system in the world, but we have now introduced the finest Source Program Maintenance System as a standard Shadow II option. (The OS SPM version is due to be released in November).

Shadow / Quota provides high performance Library files, all necessary on-line functions, full batch back-up utilities, full security against loss of data, powerful editing, fast terminal response times, on-line print display and many other time and cost-saving features.

Return the coupon now for more information on Shadow II and Shadow / Quota.

New Trial for Catamore

WASHINGTON, D.C. — Phase one of IBM vs. Catamore Enterprises, Inc. has ended with the case awaiting its second trial in Rhode Island after the U.S. Supreme Court refused to hear Catamore's appeal of a lower appeals court decision.

But nobody knows when the trial is likely to start because the Rhode Island court is functioning with only one judge whose time is consumed with criminal cases, sources said.

The First Circuit Court of Appeals in Boston last September overturned a jury decision awarding Catamore $11.4 million and ordered the case returned for a new trial [CW, Oct. 4].

Catamore fought this order through the appeals process all the way to the Supreme Court.

The case involved an unhappy user which contracted for a system prior to unbundling and which allegedly did not receive the software IBM had agreed to supply.

ZBB May End Closet Funds

(Continued from Page 1)

Sheridan noted.

Finally, the accounting department must be able to keep track of funds budgeted vs. those monies actually spent. Again, the DP operation can be expected to help, he said.

Many simulation packages are available commercially, and the Civil Service Commission has developed a prototype simulation package designed specifically for ZBB, Sheridan told his audience. He urged attendees to use mathematical models if they decide to develop their own simulation systems because these models can take into account changes in the economy and in legislation.

An agency's ZBB DP system should be driven by an accounting-budget base, Sheridan said. This base should contain a chart of accounts, an organization index, historical expenditure and budget records and current fiscal year accounting and budget data.

This accounting-budget base in turn will run a budget formulation process and a budget execution process.

Under the budget formulation process, the system will contain the simulation model, interactive programs for management inquiries, software that ranks services according to end product and programs for historical trend and possibly regression analysis.

The budget execution process will involve an appropriation accounting system, reporting on budgeted funds vs. monies actually spent, funding projections, costs to complete budget analysis, planning tools and answers to such management questions as "How am I doing?" and "How much money do I left?"

In persuading an agency's managers to use DP assistance in the ZBB process, DP installations need to keep the system simple.

They also need to use a minimum of codes and abbreviations. Where the system permits managers to interact with it, always provide prompting and don't let the system distract them from the budget process, Sheridan advised.

The special interest group on ZBB and ADP plans to hold further meetings, including a conference on this budgeting technique late this fall or early next spring, according to chairman Kendall E. Burroughs.

Open to organizations outside the government, the group was formed "to gather, develop and exchange information and guidelines for supporting ZBB with computer resources and applying ZBB techniques to ADP budgeting, Burroughs said.

Anyone interested in participating in this group can contact Burroughs at the U.S. Chamber of Commerce, 1615 H Street N.W., Washington, D.C. 20062.

IF YOU'VE

"HAD IT"

With an Ordinary Job and Ordinary Earnings...

SDI, the world's largest independent supplier of systems software, will train you to become a marketing professional in the fastest growing sector of the computer industry. We are looking for individuals with strong IBM DOS and DOS/VS backgrounds to sell our award-winning products — GRASP, FLEET, and EPAT, plus the first of a series of new products — our recently announced Operator Console Support software package and REACH — an advanced disk-space-management system.

Compensation? Salary + commission + expenses + benefits. Openings are available throughout the United States. If you're interested in us, call Don Carman collect at (415) 574-5825. Or you may prefer to send your resume or letter of interest to SDI, P.O. Box 5854, San Mateo, CA 94402.

SDI Making Computers a Manageable Resource

Mass. Probing Big Awards; Conflict of Interest Charged

(Continued from Page 1)

When and if that contract goes into effect, it will be the most sweeping facilities management agreement let by any state, according to several observers.

The other pact covers the development of programs and the use of those programs to process Medicaid claims for the state.

The state Attorney General's Office is conducting one of the investigations at the request of A&F Secretary John R. Buckley. It was the selection process followed by Buckley's office, which made both awards, that gave each of them at least the appearance of a conflict of interest in violation of state law.

Both awards ultimately involved Electronic Data Systems, Inc. (EDS), even though the Dallas-based firm's bids were apparently not the lowest received in either case. Various other alleged irregularities further cloud the Medicaid award, which went to Blue Cross-Blue Shield of Massachusetts, with the processing subcontracted to EDS.

Other bidders on one or both of the contracts included Arthur D. Little, Inc. of Cambridge, Mass.; Booz, Alan & Hamilton of Washington, D.C.; and Computer Sciences Corp. of El Segundo, Calif.

The Governor's Advisory Committee on Computers and Data Processing is conducting its own probe of both situations. And the Massachusetts Legislature, which must appropriate funds before either contract can go into effect, is also becoming concerned about how the awards were made.

Overall, the probes are attempting to determine how real the alleged conflict of interest is, what can be done about it and how a repetition of the current confusion can be avoided in the future.

Contract Delays Blamed

The question of conflict of interest revolves around an almost unknown consulting firm, Sci-Tek Associates of Boston. Two members of the firm are members of Buckley's selection committee and voted to award the facilities management contract to EDS at the same time Sci-Tek was working with EDS on another business venture.

According to news reports, Robert Orr, one of the Sci-Tek men on the selection committee, left a meeting of that group — after voting for EDS — to fly to Memphis, Tenn., where he met with EDS officials to plan a combined proposal they were to present to that city.

Sci-Tek had sought the Memphis work on its own, but was told its proposal would be considered more favorably if it also involved another firm — EDS, for instance — with a more substantial reputation, the news reports said.

Defending his company's actions, Sci-Tek co-owner James Corkery contended it was delays in the Massachusetts contract selection process that created the appearance of the conflict of interest.

The process here was supposed to be finished in January, he said, while the Memphis contract didn't come up for consideration until early February.

The Massachusetts pacts involve high monetary as well as political stakes. The A&F facilities management agreement is worth $23.5 million; the Medicaid contract carries a $19.5 million price tag.

But the Medicaid contract has even higher potential benefits for Blue Cross-Blue Shield, according to one informed source. That insurance group hopes to become the "fiduciary intermediary" — the dispenser of funds — as well as the processor of claims for the system.

If that happens, "the Blues" could gain control of a half-billion dollar operation, he noted.

But that may be a way off, for there are still several issues to be resolved in addition to the possible conflict of interest. One of the losing bidders claimed, for example, that Blue Cross-Blue Shield had an exclusive opportunity to conduct an extensive study of the Medicaid system shortly before the state decided to put the work out for bid.

Specifically, Blue-Cross-Blue Sheild ran a study for the state in 1975. This resulted in the preparation of "eight or nine volumes, covering about three feet of shelf space," according to a person who was involved with the project.

Since this work was done under contract, the state considers these volumes to be proprietary and though "the Blues" have copies, none of the competing firms can see them, he added.

Language Difference

Another complaint lodged against the awarding of the Medicaid contract to Blue Cross-Blue Shield and EDS revolves around the bidder's intention to do the programming in BAL despite the request for proposal's call for the use of Cobol.

Cobol was specified because Medicaid is a federal program and both transportability and modification of programs nationwide would be simpler with a language that is common to various computers.

On the other hand, a former official of the state's Medicaid claims program argued that since Blue Cross-Blue Shield does "most of its work" in BAL, "it would be more convenient" for the company to do this work in that language, too.

George Schussel, a member of the Governor's Advisory Committee on Computers and Data Processing, argued that the language difference "would be significant in such a proposal. Perhaps not an overwhelming issue, but certainly an important point. It is not inconsequential."

'Waves' Not Ebbing

Waves of Change by Charles P. Lecht, which has been appearing in *Computerworld* in recent weeks, will be discontinued for the remainder of the summer.

The next chapter, which concerns minicomputers and microcomputers, will appear when the series resumes in September.

At Toronto Conference

Ifip President to Speak on DP Mart, Profession

TORONTO — Dr. Richard I. Tanaka, president of the International Federation for Information Processing (Ifip), will give a major address here as part of the organization's first North American conference since 1965.

In his presidential address, Tanaka will assess the present worldwide status of the information processing community with attention to professional issues as well as the burgeoning marketplace for computer products and services.

The address will be presented on Monday, Aug. 8, immediately following the opening keynote.

Dr. John E. Fobes, deputy director-general of the United Nations Educational, Scientific and Cultural Organization (Unesco) in Paris, will also participate in the president's session and express his views and perspectives on the international impact of computing.

According to Tanaka, Fobes' remarks should be particularly pertinent because Ifip's relationship with Unesco marked the first official ties established between Ifip and other international organizations.

Issues Complex

"The issues facing the international computing community are complex and we can expect them to become even more critical in the years ahead as the proliferation of computers and data communications networks becomes even more pervasive," Tanaka said.

"These issues touch upon many areas including computer science, technology, the expanding activities of multinational corporations and the emergence of international networks. The issues relate to national interests in both the developed and developing countries, as well as the need in many areas for a relatively 'open marketplace' in order to foster the continuing development of our technology and its application," he continued.

"The worldwide growth of the computing field shows little sign of tapering off to any significant extent. For example, the world revenues of U.S. computer manufacturing and service firms is estimated to have been $26.6 billion in 1976 and may well reach $51 billion by 1981. Present estimates show that U.S. computer manufacturers account for approximately 87% of the world's computers by value," he said.

Any company whose products are commercially sound enough to compete in the demanding U.S. marketplace should probably be doing at least half of its total business outside of the U.S. Where this is not the case, the company's management might be neglecting its opportunities, he added.

Tanaka has served as Ifip president for three years and is presently a consultant in the area of international marketing and management. He is a past president of the American Federation of Information Processing Societies, Inc. (Afips) and served for many years as a senior executive of California Computer Products, Inc.

Ifip Congress 77 wil be held here Aug. 8-12, and more than 10,000 people are expected to attend program sessions and special events, plus a major exhibit of computer, hardware, software, systems and services.

The exhibits will be held on the exposition floor of the Sheraton Center.

Dr. Richard I. Tanaka

Ifip Announces Student Rates At Toronto Meet

TORONTO — The organizing committee for the International Federation for Information Processing's (Ifip) Congress 77 has announced a special $30 registration fee for students who wish to attend the international congress here Aug. 8-12.

The fee covers admission to all technical sessions and Exibition 77.

Full-time students with valid identification may register on-site.

Housing accommodations can be made by contacting Marion Hart, Canadian Information Processing Society, Suite 501, 212 King St. W., Toronto, Ont. M5H 1K5, Canada Telephone: 416-366-4586. For those students who are interested, the University of Toronto is offering single rooms at the rate of $12 per day.

Who else guarantees the effectiveness of their assembler language course?

As far as I know, nobody else. That's right. You can pay $3000 and more for a multimedia course in assembler language, and you will have no assurance that it will work.

In contrast, we offer a $15 System/360-370 assembler language book (one version for DOS users, one for OS) that is unconditionally guaranteed. If you can't learn assembler language from our book without any outside assistance, you can return it for a full refund, no matter how long you've had it.

Once a programmer finishes our assembler language book, he is more productive. Why? Because he can quickly find the statement that caused a program check . . . regardless of the language he's using. Because he can write and use assembler language subprograms. Because for the first time, he understands what is happening as his programs execute . . . he's independent, he's in control.

Who buys our books

Hundreds of companies have bought our books for inhouse training. Hundreds more for reference. And thousands of professionals have bought our books for self-improvement.

Because they liked what they saw when they received their first copy, many companies have reordered our books, both for training and for reference. Small companies too numerous to mention. And large companies like Time, Inc., Kodak, McGraw-Hill, Shell Oil, INA, and Westinghouse.

What they think of them

To date, I have received dozens of letters from people who have bought our books. Letters of praise and letters of encouragement. Some excerpts:

> *"This is by far the most exciting programming text that I have ever studied."*
>
> *"Your books have saved me around $1200 as I was going to send one of my programmers to IBM school in Los Angeles, but thanks to your manuals he now has a working knowledge of BAL and won't need to go."*
>
> *"As I read through your book, and I began formulating questions in my mind, I found that every question was answered shortly afterwards. I have never felt so comfortable with a subject that has always made me a little uneasy."*
>
> *"I have found your book to be invaluable not only as instructional material, but as a reference work as well."*
>
> *"The most useful facet of the book is the modular approach. I was not able to devote eight hours a day to learning the language, and your highly organized approach allowed me to spend any time I had available."*

What the books do

The first five chapters of these books present a professional subset of assembler language including core dump analysis and debugging. In my opinion, these chapters could be subtitled: "The Least an Applications Programmer Should Know About Assembler Language." If you do nothing more than master this material, I think you will justify the cost of the book several times over.

The next ten chapters present advanced assembler language subjects: binary arithmetic, table handling, editing, bit manipulation, translation, subprogram linkage, writing macro definitions, and using sequential, indexed, and direct files. One COBOL programmer told me she never really understood subprogram linkage before she read our book. And a systems programmer says our chapter on writing macro definitions can save hours of research.

The last chapter presents the operating system and its job-control language. It shows you how to code JCL for assembly and test runs, for using macro libraries, for linking object modules, and for using some basic utilities. For the novice, this chapter is invaluable.

30-Day Trial and Unlimited Guarantee

So there's no risk to you. I'll give you a 30-day trial period when you place your order. If you return the books within that time, forget the bill. No questions asked.

After the trial period, you have my unlimited guarantee. If our books aren't effective for you, you can return them for a full refund . . . no matter how long you've had them.

So send for your copy today. For each book ordered, I'll bill you $15 plus postage (and sales tax in California). Then you can see for yourself why I'm able to guarantee our courses when nobody else does.

Attention: Training Managers

If you are in charge of training for your company, write today for a free trial copy. Based on our experience, our books will outperform any multimedia course currently available. And due to their unique modular organization, they will increase the effectiveness of any course you're now using.

Mike Murach & Associates, Inc., 4905 North West Avenue, Suite 102, Fresno, Ca. 93705

Gentlemen: Please send me the copies of *System/360-370 Assembler Language* that I have indicated below. I will take up to 30 days to review them with no obligation. After that, if the books don't prove to be effective, I will return them for a full refund. I understand that I will be billed $15 plus postage (plus sales tax in California) for each book ordered.

Quantity Version

_____ **DOS (407 pages)**

_____ **OS (450 pages)**

SAVE $2.50 . . . Send cash with order and your price is $12.50 per book plus 50c for postage and handling (plus 75c sales tax in California). The unlimited guarantee still applies. If you return the book, you will receive a prompt refund.

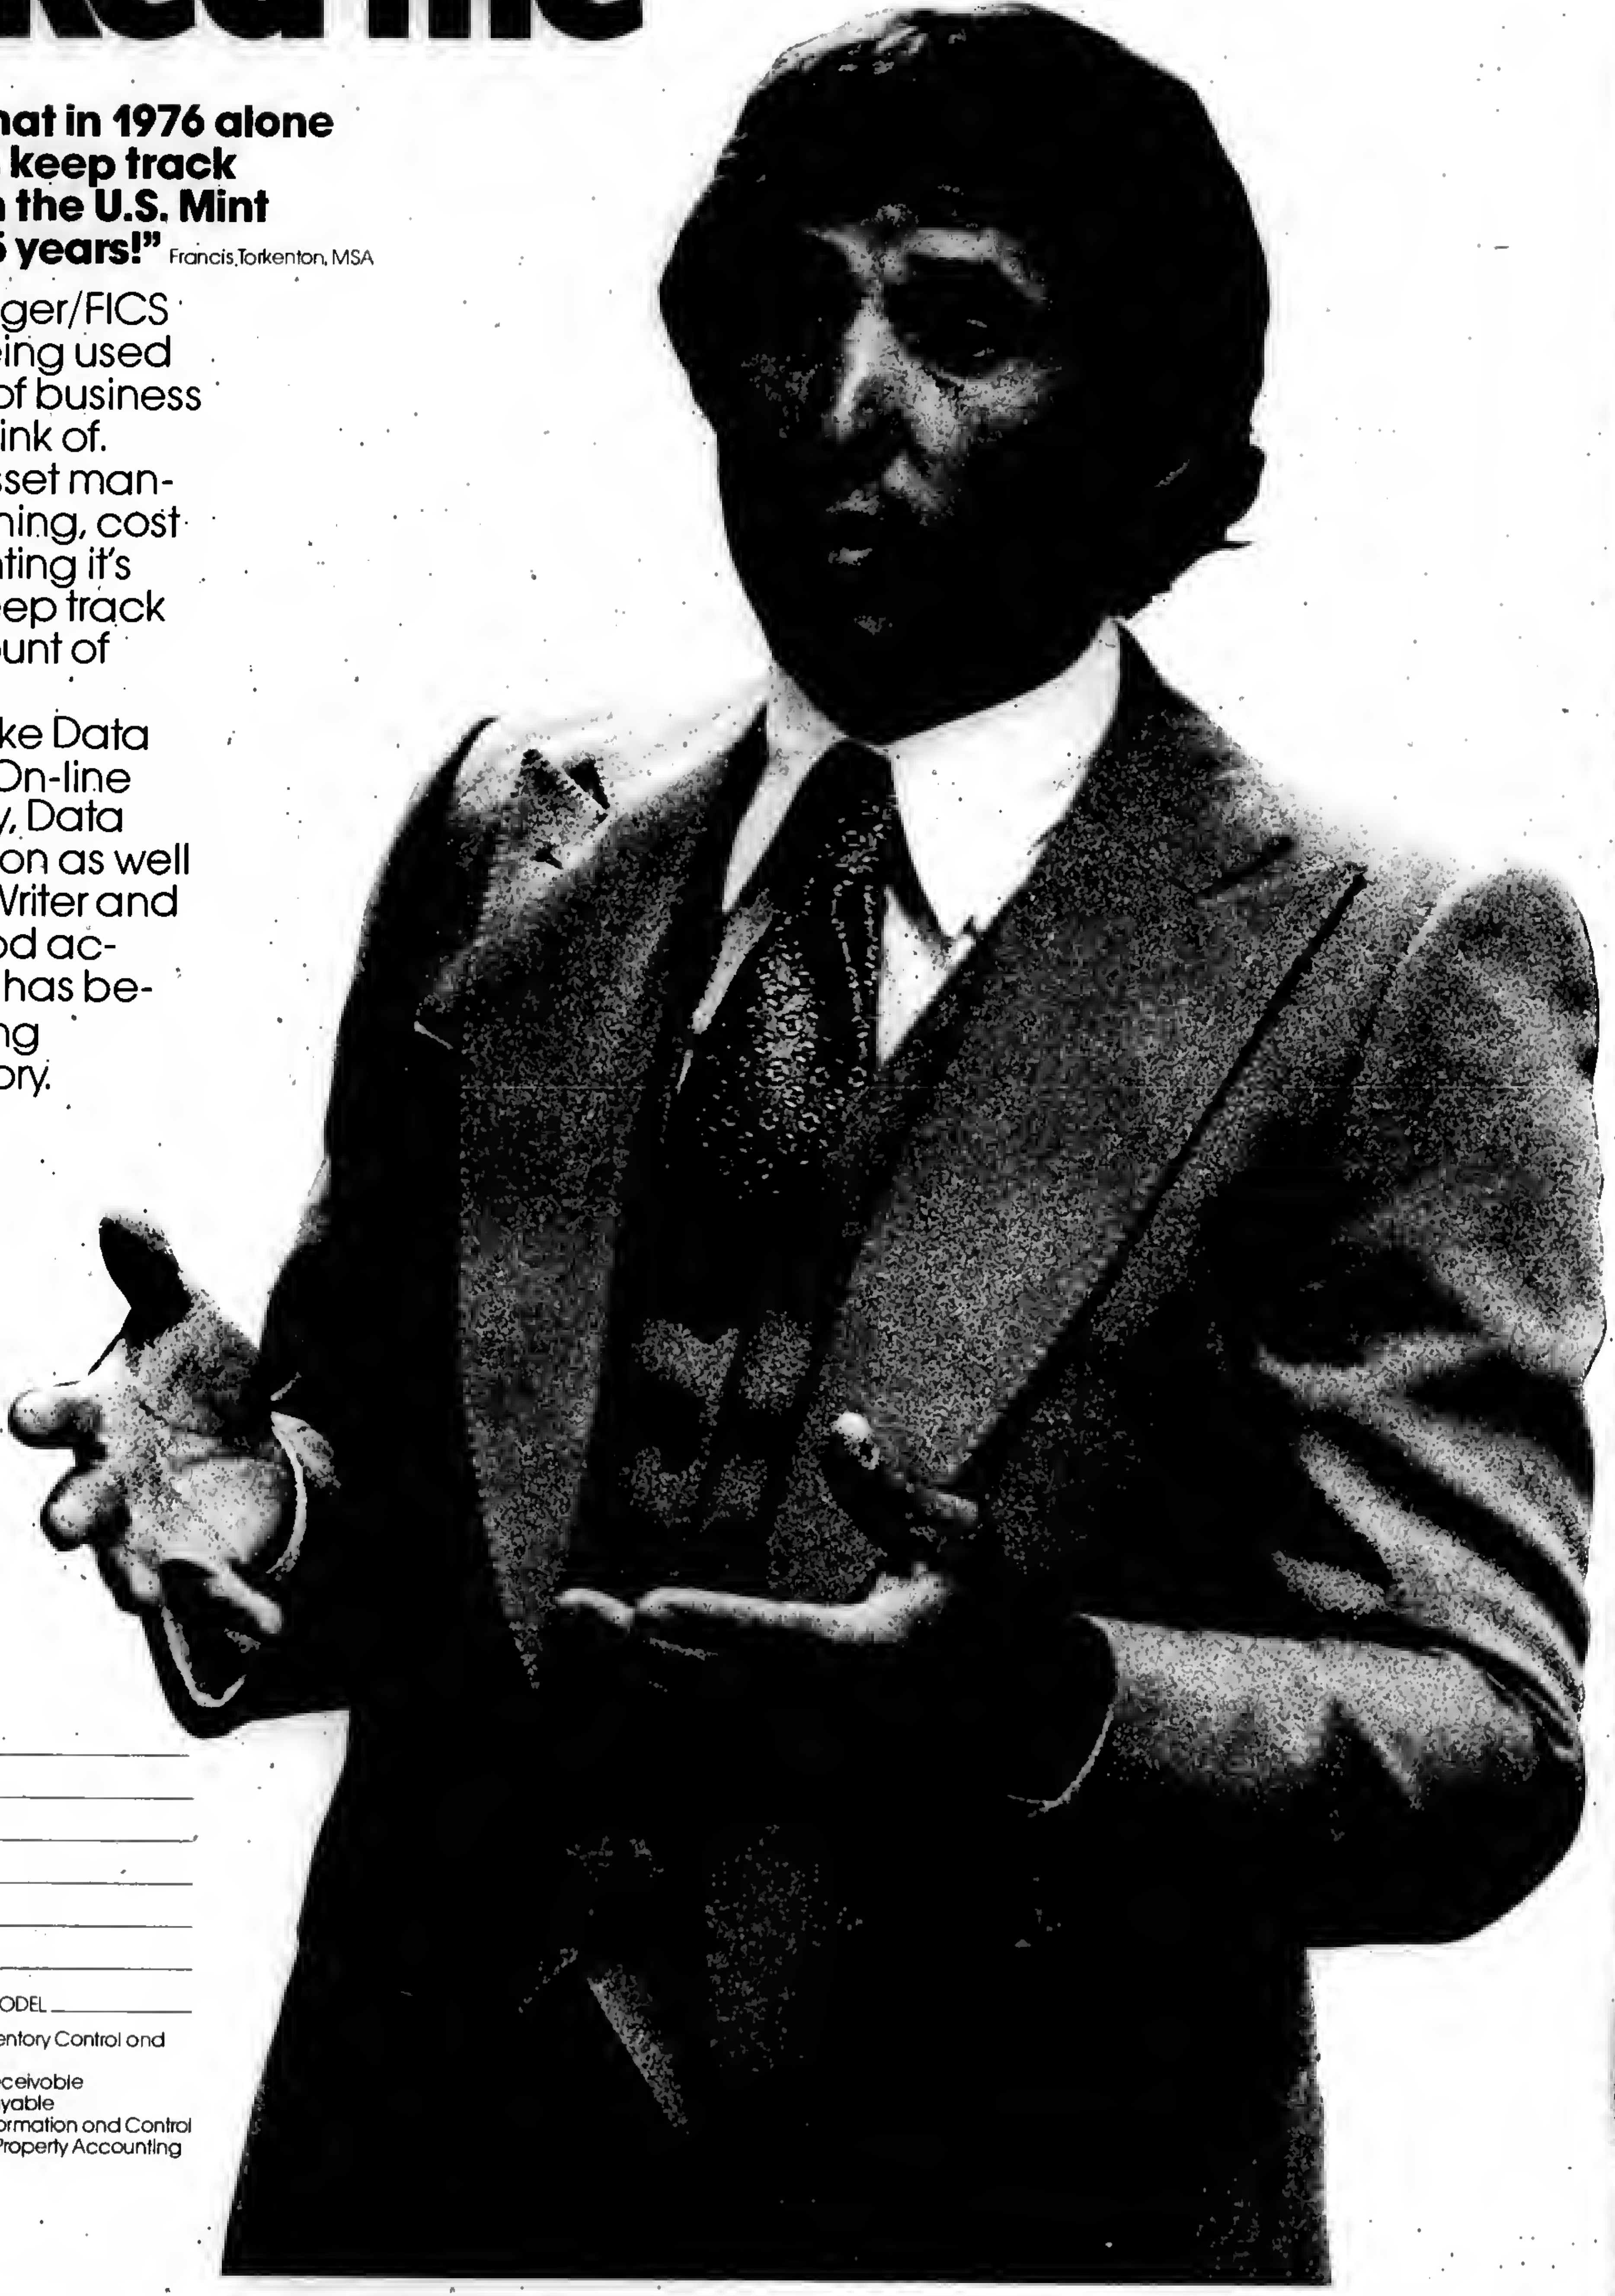
"MSA's General Ledger FICS system really shocked me"

"When I found out that in 1976 alone it helped our clients keep track of more money than the U.S. Mint printed in the last 15 years!" Francis Tarkenton, MSA

MSA's General Ledger/FICS System is currently being used in virtually every kind of business endeavor you can think of.

And as a tool for asset management, profit planning, cost and general accounting it's helping our clients keep track of an incredible amount of money.

With new features like Data Base Management, On-line Data Entry and Inquiry, Data Base Security Protection as well as a Custom Report Writer and optional 12 or 13 period accounting. The System has become the most exciting product in the category.



For further information, call
Fran Tarkenton at (404) 262-2376

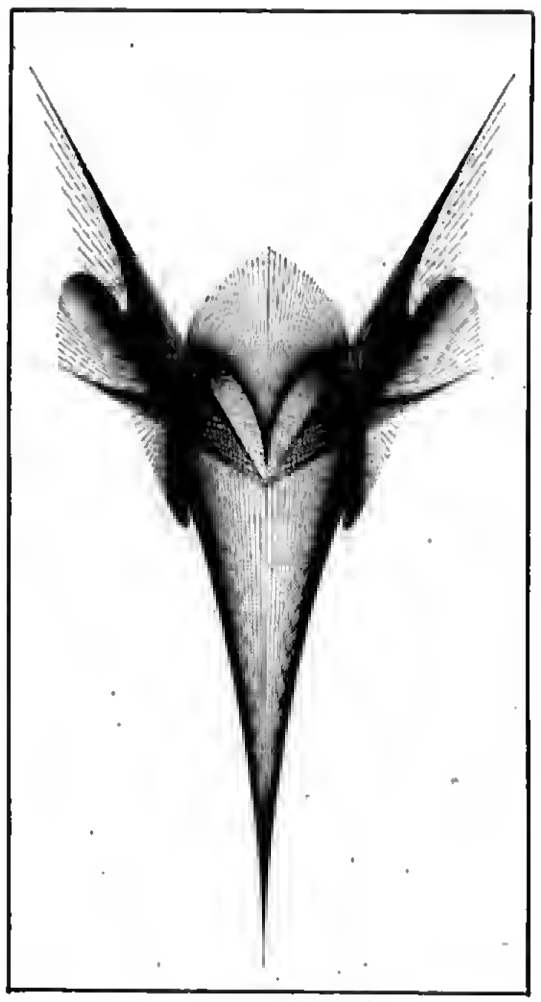
Early DP Artists Tacked on Title Last



Hummingbird

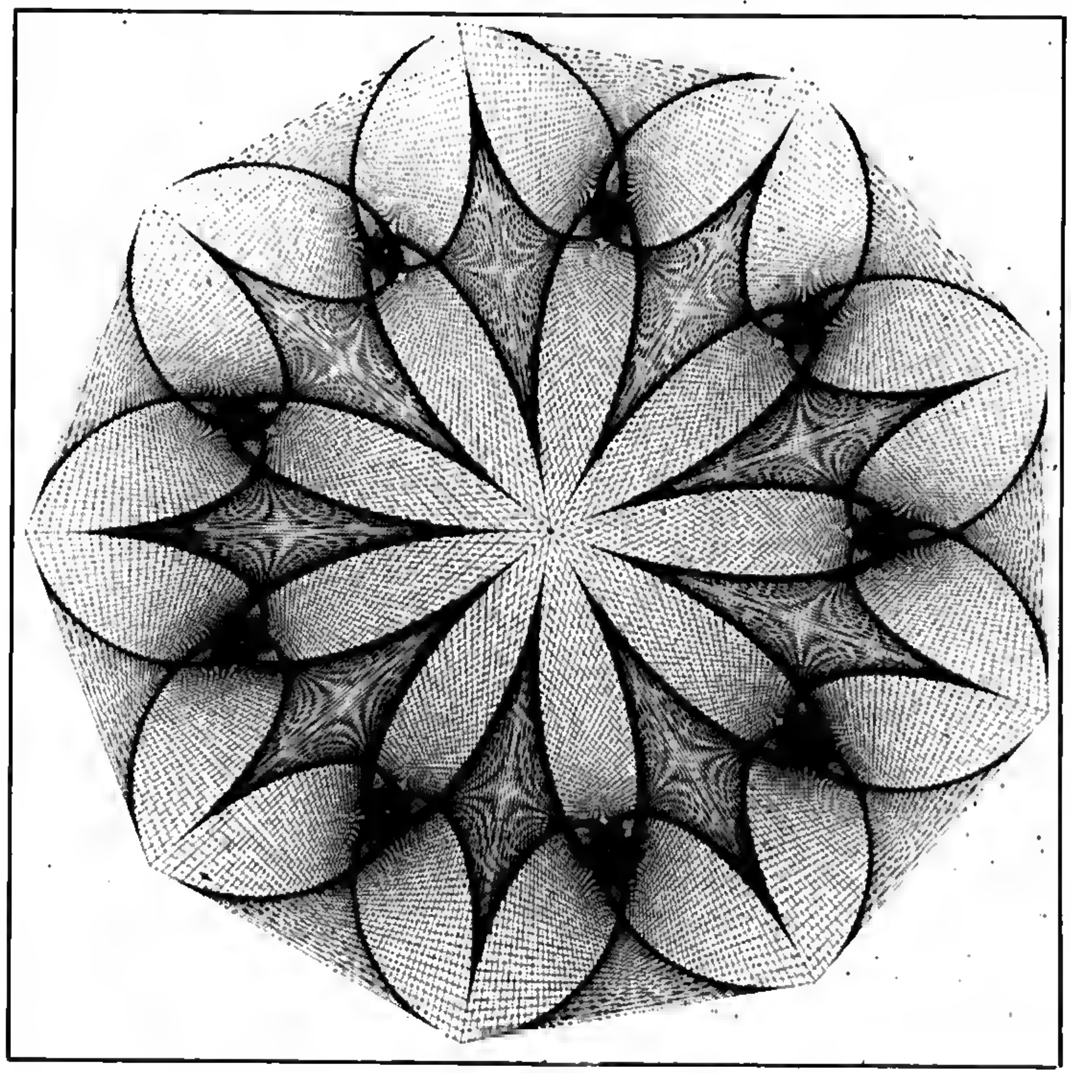
By Nancy French
CW Staff

ANAHEIM, Calif. — Although computer-generated art probably dates back to the late 1950s, interest in the computer as an artist's tool got a big boost from a contest sponsored by California Computer Products, Inc. in 1968.

In that contest, users of Calcomp printer/plotters were invited to compete for a total of $10,000 in scholarships and $1,000 in cash. The contest attracted thousands of entries.

The contest was largely a promotional gimick to demonstrate the capabilities of the company's plotters.

The relatively primitive works shown here, like most of the art from this period, was based on simple Fortran programs, according to a Calcomp programmer.



Symplexity

The artist usually started with a couple of trigometric or exponential functions, he said. These were plotted "to see where the ends of the lines went," and those were then connected with straight lines. More and more lines and angles were added until the design was completed.

These creations, such as the "Hummingbird," "Snail" and "Symplexity" shown here, for example, were named after they were created, based on what the design looked like.

These pieces of art were created by Kerry Strand, who was a Calcomp employee at the time.

The plotter actually played more of a role than merely that of a pen point, the programmer indicated, and that was because, by today's standards, the plotters were relatively slow and not all that precise. The lines they printed had a wavy quality, a Calcomp spokeswoman added.

The "moires," or shimmering patterns within the overall design, were created by superimposing two geometric patterns at acute angles.

Moires are less common in today's computer art because of the advances in the plotting tools now available, the Calcomp programmer said.

There was no on-line programming in those days either. At Calcomp, the Fortran programs were keypunched and then run through the firm's General Electric 400 computer, where they were compiled and executed.

The results were then output onto magnetic tape and the designs were printed in off-line mode on a Calcomp 702 flatbed printer/plotter, he said.

The three works shown were created generally the same way. Hummingbird was entered in the sixth annual *Computers and Automation* Computer Art Contest in 1968, where it won the top prize, the Calcomp spokeswoman said.

NOVA/ECLIPSE/PDP-11 Users FORTRAN DEBUGGING with TRACER

TRACER is a fully symbolic, high-level Fortran debugging tool that:

- displays variable names and values as they change, IF expression values when computed, labels of statements when executed, subprogram argument names and values upon entry
- allows complete control over the type and amount of diagnostics generated
- is automatic and simple to use
- eliminates the need to know compiler-generated code
- *SPEEDS debugging and increases programmer productivity*

Available Now. Customer references and a free User's Manual are available. TRACER is one result of Information Processing Techniques' continuing efforts to provide program development and debugging tools for minicomputer users.

States With Laws on

By Toni Wiseman
CW Staff

Several states joined the electronic funds transfer (EFT) bandwagon during 1977 and enacted laws to set to rest — at least temporarily — the questions often raised about branching, sharing and various EFT functions.

Spurred perhaps by the sporadic reports and recommendations issued by the National Commission on EFT, the states of Arkansas, Colorado, Idaho, Maryland, Montana, New Mexico, North Carolina, South Dakota, Tennessee and Utah were among those that either approved legislation for the first time or broadened or redefined existing laws.

Thirty-two states currently have laws affecting EFT. Of these, some (such as Kansas) have different laws for banks than for savings and loan (S&L) associations. In toto, 12 laws permit limited branching,

STATE	Applies To	Branching Law	Out Of State Entry	Is Facility A Branch	UNMANNED REMOTE FACILITY							
					Geographical Area	Functions				Sharing		Advance Supervisory Approval
						Deposits	W D	Pre-auth Loans	A C Transfers	Like Institutions	Unlike Institutions	
COMPTROLLER OF THE CURRENCY (Revised Ruling May 9, 1975 Rescinded August 23, 1976)	National Banks	N/A	N/A	No	Within 50 miles of main or branch office^1	Yes	Yes	Yes	Yes	P^2	P^3	Notice only
ALABAMA Act 1127 Laws of 1975	Banks S&Ls CUs	L	Yes Reciprocal only	Silent	Silent	The Superintendent of Banking may authorize activities properly incident to the business of banking through on-premise as well as off-premise operations. Savings and loan associations and credit unions may not offer services now prohibited to them. NO distinction is made between manned and unmanned remote facilities.						
ARKANSAS Act 643, Laws of 1977	Banks	L	No	Silent	Limited	Yes	Yes	Yes	Yes	P	S	Notice only

EFT Now Number 32

21 allow statewide branching and seven sanction unit branching.

Only five states — Maine, Oregon, New Jersey, New Mexico and New York — define remote facilities as branches. Ten states, however, have remained silent on the issue.

Sixteen states have mandatory sharing provisions for like institutions, while only seven mandate sharing among unlike institutions.

Along with the new legislation, industry observers are witnessing a flood of new lawsuits challenging these laws.

The Michigan Bankers Association, for instance, has filed suit to ban a banking commissioner's order permitting state credit unions to issue share drafts.

In another one, the Justice Department has brought an antitrust action aganst the Rocky Mountain Automated Clearing House Association located in Denver. The suit charges conspiracy on the part of the bankers to deny credit unions and S&Ls equal access to clearing facilities.

These charts, recently updated by the American Bankers Association (ABA), give a state-by-state overview of legislation currently in force which covers EFT systems [CW, Dec. 6].

They detail which financial institutions are covered by law in each state, the nature of a state's bank branching law (S-statewide, L-limited branching, U-unit banking) and whether and under what conditions units owned by out-of-state banks are permitted.

The charts also illustrate whether a state treats remote facilities as branches.

For unmanned remote facilities, each state is reviewed to determine if and to what extent distinctions are made between manned units such as point-of-sale (POS) terminals and unmanned units such as automated teller machines (ATM).

If a state law permits unmanned remote facilities, the law is screened to determine where it permits a facility to be located.

The charts also examine whether a facility can accept deposits or dispense cash (W/D); if lines of credit or preauthorized overdraft privileges are available through the units; and whether transfers between accounts, such as savings and checking, are permitted (A/C Transfers).

Each law is examined to determine if an establishing financial institution must share its unmanned remote facility with other institutions and whether such sharing is mandatory (M), a permissive requirement (P) or silent (S).

The laws are also categorized to show whether institutions may or must share with like institutions — banks with banks, savings and loans (S&L) with S&Ls — and with unlike institutions (banks with S&Ls).

Finally, the ABA has examined whether the governmental official with jurisdiction over financial institutions must act to authorize a facility or if only notice of intent is required.

State	Applies To	Branching Law	Out Of State Entry	Is Facility a Branch	Unmanned Remote Facility							
					Geographical Area	Functions				Sharing		Advance Supervisory Approval

---

1 Although this ruling has been rescinded, it is included in this chart because it was looked to by many states when they enacted legislation Effective November 3, 1976, the Comptroller's Office issued revised procedures for national banks to establish CBCT branches in states where state banks are permitted by law to establish traditional branches or CBCT branches

2 Permissive sharing within 50 miles, beyond that distance a CBCT must be made available to local financial institutions

3 Home office protection is provided

4 Other owners must share with banks; may share with S&Ls and CUs

5 To the extent consistent with anti-trust laws, sharing is required

6 The Bank Commissioner may establish rules and regulations for the operation and sharing of facilities to the same extent and effect as rules and regulations promulgated by the Comptroller of the Currency with respect to sharing and operation of facilities by national banks

7 An association may not enter into an agreement to use a terminal at a location where other financial institutions would be prohibited from doing business

8 A customer of an out-of-state financial institution may debit his account at an in-state terminal to pay for merchandise or services, provided the merchant credits an account in a Montana financial institution

9 Non-discriminatory access must be made available to all financial institutions or branches located within the area that may use the terminal.

10 Commissioner may require sharing with institutions insured by FDIC or FSLIC.

11 Establishes parity with federally regulated financial institutions, including federal S&Ls.

12. Out-of-state bank may use facility if Oregon bank may use facility in home state of non-Oregon bank

13. Provisions of act effective until July 1, 1977.

14. Out-of-state banks may use a facility in Wisconsin if consent is given by a Wisconsin bank using the terminal

15 Savings banks may share facilities established by either a bank or savings and loan association

Editorial

The Dilemma of Reorganization

Just under a year ago a national commission recommended "that there be established in the Executive Office of the President an Office of Information Policy."

Instead of following that recommendation — made by the Domestic Council Committee on the Right of Privacy under then Vice-President Nelson Rockefeller — President Jimmy Carter has chosen to downgrade the role of the one agency dealing with information policy in the White House, the Office of Telecommunications Policy (OTP) [CW, July 25].

Like almost every issue to be faced by government, this one has two sides.

There is a crying need for reform and reorganization within the executive branch of the government. Unneeded agencies should be abolished, others need reorganization and still others need to be made more effective.

This was one of President Carter's main campaign themes and it will be one of his Administration's major thrusts.

On the other side of the coin, however, there is a need for a coordinated national information policy.

As the Rockefeller report noted: "A great number of public policy questions are being generated by advances in computer and communications technology, by shifts in the U.S. economy from a manufacturing base and by citizen demands for clarification of their rights to have and control information.

"The answers to the questions which are being raised will make up the national information policy, whether they are arrived at consciously or unconsciously, by commission or omission, carefully or haphazardly, in a comprehensive or in a piecemeal fashion. The issue thus is whether or not government will attempt to take a considered unified approach in arriving at these answers."

Frankly, we're stuck between a rock and a hard place, as the old expression goes. We feel reorganization is necessary, but there is also a need for a strong coordinated national information policy, with White House direction and support.

And that's the problem with the whole idea of reorganization — and a concomitant reduction — of government.

Most people agree it is a good idea — as long as it does not happen to their pet projects and interests. The environmentalists say "fine" to reorganization in principle, but "no" to abolishing the Council on Environmental Quality; the bureaucrats are all for it, as long as their agencies are not threatened; business is all for reduction in government, except for those programs that aid business; and so on ad infinitum.

Probably one of the reasons the OTP was among the first White House agencies to get the ax is that it does not really have a well-defined special interest group to support its existence.

Certainly the American Federation of Information Processing Societies (Afips), which wrote Carter in support of the OTP programs, cannot be considered a very effective voice for the agency. After all, it doesn't even take stands on issues, much less deliver the votes.

And generally — let's face it — the user and vendor communities are not very vocal on any of the major issues handled by the OTP. The only vendor organization that consistently takes stands in Washington is the Computer & Communications Industry Association; the user community has no representation at all.

So while the idea of a national information policy coordinated in the White House is a good one, it clearly does not have a constituency in the computer community, much less in the general populace.

It should come as no surprise, therefore, that the OTP will be one of the first casualties of government reorganization. Without strong support, it probably deserved to die.

Data Past

Five Years Ago
Aug. 2, 1972

WASHINGTON, D.C. — Sen. John V. Tunney (D-Calif.) introduced a bill requiring banks and other financial institutions to protect the privacy of their customers. His bill was an amendment to the Bank Secrecy Act of 1970 and would require banks, credit card companies and other "financial institutions" to treat all customer accounts as confidential. A subpoena, court order or the customer's permission would be required before any information could be disclosed.

— — —

OMAHA, Neb. — In a week of confusing legal activity, one court barred IBM from making a product announcement but was later overruled on an IBM appeal. IBM then said it would announce two models in the 370 series — the 158 and 168 with Virtual Storage.

Eight Years Ago
Aug. 6, 1969

NEW YORK — IBM introduced the System 3, designed for small business firms. The system included a 96-column punched card with 20% greater information capacity than the 80-column card, RGP-II and monolithic systems technology enabling switching speeds of 8- to 12 nsec.

Letters to the Editor

Are DPers Playing Charades Around Human Rights Issue?

I read the Reader Commentary in the July 18 issue ["Is Supplying DP Training to Iranian Police Ethical?"] with great interest. The subject was timely and one which I hope will receive greater attention in the future.

Jack Stone's argument did little to allay the concern I have for the way we relate as an industry to unjust or repressive institutions in our world.

In the final analysis, Stone stated that he would have violated the trust of his customer and ignored the foreign policy of our country if he had not taken the job.

I found Stone's comments quite disturbing, not because I believe him to be a bad man (which I don't), but precisely because I think that his arguments reflect the general or even "the highest level of ethical standards present in the computing industry."

If we let business interests outweigh human life and freedom in our consciences, then we are merely playing charades when we talk about our concern for human rights.

Max D. Bishop

Detroit, Mich.

On Being a Committee of One

I read the interchange between Saul Tannenbaum and Jack Stone on the ethics of Stone's training the Iranian police [CW, July 18]. I wish to comment.

I do not accuse Stone of unethical conduct since he is obviously unclear about the nature of the Iranian regime. But now that he has been told of the nightmarish character of that government, I believe it his duty to investigate further before undertaking any further assistance to it.

Stone asked, "Do I become a committee of one and reject my students and turn aside my customer and, in another dimension, discard the policy of friendship with the Iranian government, which is the established policy of the U.S.?"

He answers "No." I answer "Yes."

A person's behavior is his own responsibility, not that of his students, his customer or the U.S. government.

Articles on Report Writer?

I am responding to William Englander's recent call for information regarding the Cobol Report Writer [CW, July 11].

I have been looking for comparison studies between the conventional use of Cobol write statements and the Cobol Report Writer features and have come across only one article on Report Writer, "Using the Cobol Report Writer," by Harry T. Hicks Jr. It appeared in the September 1972 issue of Dotomotion.

Like Englander, I also would encourage any CW readers to respond if they find any information concerning Cobol's Report Writer.

DP Teams Need Greater Self-Awareness

By Jack Stone
Special to CW

Last week, I presented the first part of an interview with William j. Front and Carol M. Vaughan of the U.S. General Services Administration, who are exploring new ways of improving the organization, communications, member atttitudes and creative climate of the DP project team.

We talked of "team development," a set of strategies developed by behavioral science researchers which are designed to improve results from the project organization by creating a positive atmosphere of confidence and coordination. This situation is brought about by first matching individual members' needs and project needs more effectively, and then establishing a climate for interpersonal communications and cooperative activity.

In this column, we discuss the Frost/Vaughan application of the team development process to their DP communications problems.

Q: How have you addressed this rather challenging problem of building and developing successful project teams?

Frost: We have approached the team development problem just like any other DP project. The first step, of course, was setting down the objectives, which we did after considerable research and study. The first objective is to have each member of the project team assess how he or she works in a group and how he or she relates to the supervisor and other "nonsupervisors" in the work environment.

The second objective is to examine the current operating patterns of the project organization and to construct alternatives by examining the effects of human behavior on individual and organization achievement. The third objective is to have each member of the team learn new tools and techniques to help the team achieve creative, productive solutions to DP problems.

And the final objective is to have the team, as a functioning unit, apply these tools and techniques to team problems.

Q: What is the general format of the team development project?

Vaughan: The heart of the project relies on the team itself to use team concepts in solving everyday problems that affect the group; members manage their own learning and monitor their own behavior. But first they need some common understanding and goals. These are agreed upon in a two-day workshop led by a "facilitator" trained and experienced in team development.

The Human Connection

Q. And how is the two-day workshop conducted?

Vaughan: The first day and a half is devoted to meeting the first three objectives. Now, to help the team members assess, in effect, individual and team behaviors, we use a variety of techniques including survey instruments based on the "managerial grid" and the "Johari window," role playing exercises, instruction in the style and techniques of "brainstorming" and problem-solving and an introduction to the principles of team development and behavior.

Frost: Then, the final half day provides "live" workshop instruction.

A particular problem is selected by the group and is analyzed using the problem-solving techniques learned earlier in the class. The techniques, by the way, include a standard set of problem-solving steps whch is used by the team as a guide.

Obviously, the last half day is most crucial. Success of the class is in great measure determined by the openness and cooperative spirit of the team.

Q. The "Managerial grid" sounds interesting. Just what is this technique and how does it help team development?

Frost: The grid, as developed by Blake and Mouton, is based on the concept that a project manager has two major concerns regarding the final project product: concern about the project people and concern about project results. The grid is a two-dimensional graph which provides a representation of managerial style by plotting "people concern" on the vertical axis and "results concern" along the horizontal. Concerns are measured on a quasi-quantitative basis on a scale of 1 to 9. Thus a 9:1 manager is interested

Australian Trade Law Causing DP Furor

The Taylor Report

By
Alan
Taylor
CDP

Richard St. John of the Australian attorney-general's office explained that the recent contretemps between IBM and the Australian government, which resulted in "most" IBM products becoming unavailable there, at least temporarily, originated after Parliament amended the Trade Practices Act so as to protect the common-law rights of hospitals, businesses, schools, etc. — and those of "natural persons."

The common-law rights to which he was referring are built into the laws of most American states, as well as those of Australia and many other places, and they basically allow someone to recover damages resulting from improper behavior. However, it has until now been permissible for contracts to exclude such rights, and IBM has quite properly done so.

During the passage of the bill, St. John told me, there were no objections raised by IBM, but after the bill went into effect on July 1, IBM told the Australian government it was not prepared to work under the provisions of the act, because it created too great a risk for the firm. Other manufacturers followed the IBM lead.

Apparently the Australian government was unimpressed by this late claim, at least on the surface. It simply pointed out the company's prior silence on the matter.

That was as far as the issue had gone when this column was being written, although developments may have obsoleted this particular report by the time you read it. However, it seems unlikely that the basic situation which leaves Armonk and Canberra in a potential confrontation situation will be more than papered over at best. It is quite possible that this may be the nucleus which will show users here, as well as in Australia, just how much risk they are taking through accepting standard contracts. So let's look at the situation.

Australia & Computers

Australia's computers are currently being supplied by three different countries: the U.S., Japan and England. In real terms, however, the American interest is predominant, with only some 181 English-based systems and 18 Japanese systems reported in the May 1977 computer census figures, compared with some 1,200 U.S. systems.

IBM is predominant, both in the number of systems and in their size. There are, for instance, some 57 370s in the 145 or larger range and 24 360s at least 360/50s. There was a reported total of 312 IBM systems in the country.

Beyond the actual IBM-owned computers, the firm's influence goes further, with IBM services providing maintenance for IBM and non-IBM systems alike. Even where maintenance is not being directly handled by IBM, IBM is supplying the parts to the people who perform the maintenance. Potentially, therefore, it would be possible for an IBM withdrawal to effectively strangle the use of any or all of the 312 installed IBM systems.

The contracts IBM was offering prior to the current situation were no different from those they offer on a worldwide basis. As in the U.S., users in Australia were not protected from IBM's simply announcing it was changing the terms under which it operates. And, in fact, like most of IBM's customers worldwide, they received the April announcement of IBM's intention to change the contractual terms unilaterally, when it suited the corporation to do so.

Both the old contract, which is still operating, and the new terms IBM has said are coming greatly limit the ability of a user to make more than a small recovery of damage caused by IBM's misbehavior. These are the terms IBM feels it cannot live without, and these are at the center of the current dispute.

There have, of course, been situations in other countries before where IBM's contract terms were not acceptable. As far as I can find out, however, such countries, unlike Australia, have not been supporters of free enterprise. The continued use of any installed IBM computers was negotiable with some government body that would handle the purchase of spare parts, software, etc. on a countrywide level.

But Australia is different. There is no government agency which controls the computer sites and can negotiate as a unit. Australia falls into the standard user-to-IBM situation, and IBM may well feel that any substantial consideration given to the Australian user will have to be similarly provided to users in other countries.

Certainly the corporation would be hard put to explain to other governments why their nationals should not be equally protected from IBM errors as Australia's nationals.

Australia, however, would be equally hard put to explain to its voters why IBM should have any preferred treatment at the expense of Australian organizations.

Further Complications

The problem is further complicated by the current composition of the IBM board and that of the Carter Administration. The sight of T. Vincent Learson and the other former Ford Administration directors returning to their top-level positions when Carter came in makes any protestations of impartiality or separation from the company appear mere rationalizations of some legal fiction..

In fact, any pro-IBM action by the Carter Administration will probably — unless specially insulated from IBM connections — to be regarded as a use of U.S. influence to protect a private multinational.

And yet, unless matters are settled quickly (which seems unlikely, considering the scope of the controversy and the number of other U.S. firms that trade under similar contract conditions across the world) some U.S. government actions seems inevitable. American jobs in research and production are at stake as well as the property of a major U.S.-headquartered firm.

One can't just stand aside at that point and hope that everything will go away. Yet, currently the White House apparently has no plans as to how to insulate its actions from the IBM taint.

This suggests that accidental confrontation can very, very easily occur. Let us watch what happens and hope that computer users will find their situation improved, and not damaged, at the end of the battle.

CCP Won't Replace CDP

Articles on Certification Rife With Paranoia

By Jim Brown

Special to CW

Three pieces on certification in the June 20 issue of *Computerworld* offered more misinformation and paranoia than fact. I refer to Ken Lord's fears of seeing the Certificate in Data Processing (CDP) outdated, John D. MacLean's letter calling licensing a "cop-out" and L.D. Rizio's reader commentary on licensing.

Ken Lord appeared 180° off course, MacLean was off on another tangent and Rizio had some good answers to the wrong questions.

Let's start out on the far end of the limb and try to bring all three back to the real world.

The Certificate in Computer Programming (CCP) exam will be offered by the Institute for Certification of Computer Professionals (ICCP) beginning Oct. 22. Contrary to Lord's "Corner" column, this certificate is in no way a replacement, substitute, prelude or "capstone" to the institute's already established CDP program.

The CDP program is directed primarily at business-oriented DP on the management or supervisory level. The CCP exam is targeted at the upper skill levels of those practicing business, scientific or systems programming.

These areas certainly can overlap as career paths, but as testing subjects and certification goals, the knowledge required of the successful candidate is markedly different. The accomplishment of either certificate is an end in itself.

There is room for both to coexist, as well as new exams in DP auditing, systems analysis or other potential subjects. One, both or more might be appropriate to an individual's goals.

MacLean's letter to the editor was obviously a reaction to the CCP program, although he failed to distinguish licensing from certification and, after raising legitimate content questions, did not carry through to see how or if such questions had been resolved by the CCP Certification Council under Dr. William Cotterman of Georgia State University.

What of MacLean's image of a poor programmer, born and raised in Autocoder? Is the ICCP going to force him, kicking and screaming, to learn PL/I against his will (wreaking havoc upon life, liberty and the pursuit of wordmarks?)

The exam covers programming, not coding. Emphasis is on techniques, thought organization and practices rather than language mechanics. Even more, anyone who claims, for example, to be a senior programmer in a business environment without having at least a reading knowledge of Cobol is smoking his tennis shoes.

The demarcation between certification and licensing is an important one. Certification carries no legal sanction, but licensing can stand in somebody's way of making a living. The distinction leads us directly to Rizio.

Rizio's commentary was certainly the most accurate of the three I have cited. The only point of contention is my belief — or hope — that licensing is a possibility far more remote than Rizio seems to think.

The point that "we are not knowledgeable enough to be able to detect all fraudulent activities, improper procedures or poor systems designs" is well taken. Licensing would attempt to force good practices, but certification addresses the issue from a different angle.

Certification encourages continuing education and expansion of the individual's capabilities. Secondly, it serves as a consciousness-raiser to alert people that ethics, good practices, codes of good conduct and responsibility are indeed considerations for each individual to address. Read Donn Parker's fraud studies and find out how many people didn't even think they were doing anything wrong.

Reader Commentary

Revoking a license cannot enforce that consciousness; but encouraging a certificate can engender it.

The ICCP, representing eight professional societies on the subject, said in January of 1975 that ". . . at the present time there are no generally accepted definitions of job functions . . . or agreement upon knowledge and skills to practice in those jobs. Consequently, licensing will be premature until the needs stated above are met."

One might speculate whether those needs can ever be met.

Can you defino a "professional" in data processing? Don't look in a mirror — yet. "Professional" is the greatest buzzword to hit recruiting ads since "Equal Opportunity M/F." How does "professional" tie in with certification?

Certification provides a uniform measure of knowledge and performance potential. To the practitioner, the certificate is a credential of substance in self-assessment and peer group evaluation.

Certification offers a challenge, and willingness and ability to meet that challenge is a good working definition of professionalism. Some feel that DP won't be a profession until we fit into the mold of doctors, lawyers and accountants.

Until Marcus Welby operates on a data base or Perry Mason solves his first core dump, we need to look for images without so much romanticism.

Brown, monufocturing systems project leoder for Crone Co. in Chicogo, is on the boords of directors of the ICCP ond the Associotion of Computer Progrommers ond Anolysts.

Teams Need Awareness

(Continued from Page 13)

in results to the exclusion of people, and a 1:9 manager focuses on humanistic concerns to the exclusion of results.

Vaughan: We administer contrast surveys based on the grid during the class, one for supervisors and one for nonsupervisors. These surveys enable each individual team member to plot his dominant and backup styles. As the results are discussed, each team member becomes quickly aware of the attitudes he brings to the team.

Q. And the "Johori window"?

Frost: This is another graphical technique which helps team members understand the dynamics of team communications. We have a style of rectangular plots which present a simplified model of the interactive communications process. On the horizontal we plot information that ranges from that which is known to that which is unknown to the *individuol*. On the vertical axis we plot information that ranges from that which is known to that which is unknown to others.

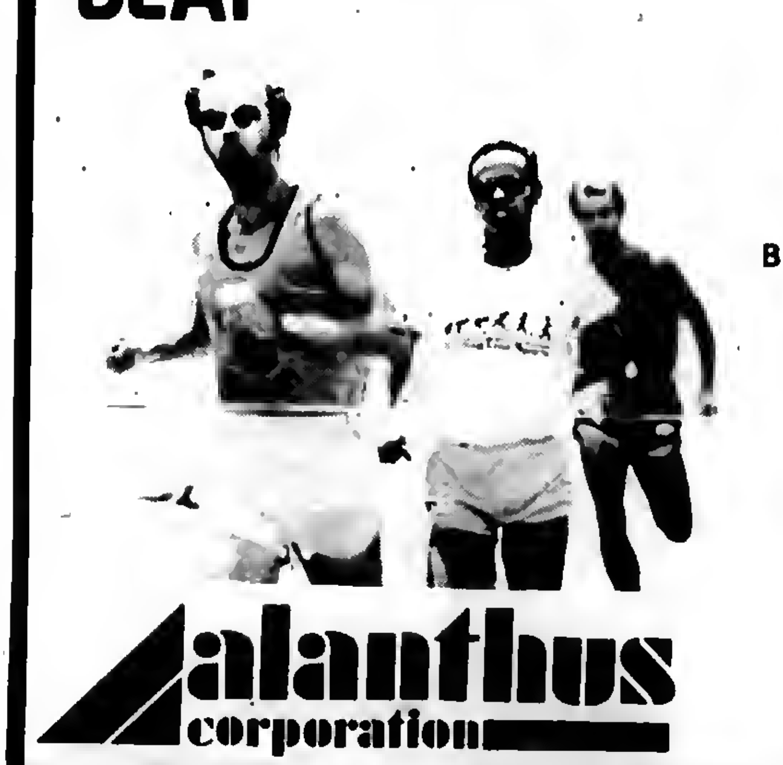
Vaughan: We use contrast surveys based on the "Johari window" to provide insight as to how the manager believes he is communicating to employees, in contrast to how the employee perceives this communication.

Since there is usually a disparity which can be depicted on the graph on a quasi-quantitative basis, the group can proceed to examine the causes for this misunderstanding and take action to adjust.

Q. Will you comment on the results of your explorotions thus for?

Frost: Surely. We have implemented a number of programs during the past three years. Although they must still be considered as pilot in nature, we are pleased with the results thus far.

We have documented the results in our paper "Within Context — The Application of Team Concepts to Work Teams," to be delivered at the annual meeting of the Association for Computing Machinery Special Interest Group on Computer Personnel Research, which takes places on Aug. 18 and 19 in Washington, D.C.



ON ANY TRACK WE'RE HARD TO BEAT

When you talk about leasing an IBM/370, you are on a fast track. Each leasing company claims it has the best program for you. But does it? With over $200 Million of IBM/370 equipment on lease in the U.S. and overseas, Alanthus' customers are saving more than $17 Million annually. That's a real winner!

Our leases are unmatched in flexibility. We can offer you a short operating lease, a long term financial lease, or even a revolving lease. Working with you, we can custom tailor the lease program to suit your needs. You win again!

But here's one to get you first past the post. Alanthus is offering to installed 370/158 and 370/168 users, operating leases of 1, 2, 3, and 4 year terms.

Our lease documentation is easily read and understood. It consists of only four pages plus an equipment schedule. Another winner!

Call the people from Alanthus.
We have the lease program that's best for you.
We're winners on any track.

'Abend-Aid' Aids MVS

CLEVELAND, Ohio — Release 2 of the Abend-Aid source-level debugging tool from Tomark is said to eliminate the potential conflicts this package might have with others attempting to do specialized Abend processing.

The package controls and formats the information dumped on the printer when the system hits a program check causing an abnormal end of execution of the then-current program. Users can select the data and format, if any, they wish for each type of Abend.

A major enhancement in the new release protects the user from losing data in the event of recursive program checks. Another enables the debugger to be used in an MVS environment, a spokesman noted.

For users working with data bases, the Abend-Aid update also provides for the diagnosis of IMS completion codes for both batch and on-line program crashes. The package traces the control chain to the application program level, he said.

Abends occurring in an IMS environment can be handled differently from the same abends in a non-data base setting, he stated, and an IMS user code Abend extension is now being tested.

Price of the package is $2,975 for OS/VS systems and $3,975 for MVS installations, Tomark said from 5645 Beacon Road, Cleveland, Ohio 44131.

'Dynam/D' Controls Pooled Disk Space

NEW YORK — Support for pooled disk space and for several versions' of individual files are among the enhancements built into release 1.1 of Dynam/D, the disk space and catalog management software system for IBM DOS and DOS/VS from Computer Associates, Inc.

The package determines space available on a specified disk and dynamically allocates that space as a file is opened, not before the job is initiated. The package also allocates additional space if the space originally requested isn't enough, a spokesman explained.

The disk pool management facility allows the user to select from a group or pool of disk volume serial numbers to be used for the space allocation. Disk space allocations can therefore be set up to relate to the partitions in which a program is executing.

In this way, a better balancing of disk use is achieved, the spokesman claimed. The user can also define protected areas on any disk and these would never be used by Dynam/D, he added.

The generation data set facility is especially useful when an installation has a need to create and be able to access multiple generations of a given file, he said.

Facilities to backup and restore direct access storage device files are also part of release 1.1, allowing the user to save a disk file on tape and bring it back later to disk.

A display facility for the Dynam/D catalog file enables the user to determine all the attributes related to any file defined in the catalog.

An interface between Dynam/D and the vendor's CA-Sort allows work space on sorting tasks to be released after the input file has been initially read by the sort system.

Dynam/D is available for as little as $5,000 depending on options selected, Computer Associates said from 655 Madison Ave., New York, N.Y. 10021.

'Price' System Estimates Software Costs, Timing

MOORESTOWN, N.J. — DP managers can now get help in estimating the costs involved with major software projects by utilizing the Price S modeling system from RCA, which has been installed on several remote-computing service networks.

Price S is said to permit rapid evaluations based on project size, type difficulty and scheduling constraints. System configuration, desired percent of system utilization and reliability requirements are also factored into the model, a spokesman noted.

The system is an interactive operation with conversational input and output, structured around regression techniques and internal self-checking to validate the input before it is used, he said.

In addition to definitions of the technical aspects of the project, Price S also accepts user-selected economic and technology growth factors to produce cost breakouts of five categories in each of three overlapping development phases. The categories are systems engineering, programming, configuration control, documentation and program management.

Resource expenditure profiles are provided for each of the development phases — engineering design, implementation and test and integration — together with controls that will adjust these profiles to user requirements, the spokesman explained.

Operation Modes

Normal operation computes costs directly from user inputs. Ecirp mode, on the other hand, enables Price S to run "in reverse" to calculate empirical data factors from known project costs — an "extremely useful" feature for model calibration, he added.

Geosyn, the third mode of operation, uses specified costs to compute typical program sizes and project schedules. This allows Price S to be used to investigate feasibilities and to set scope-of-work goals for design-to-cost efforts, he continued.

Network Choice

Price S is currently on the American Information Services network, based in Greenwich, Conn., and the On-Line Systems net, headquartered in Pittsburgh. Unlimited use of the system through one terminal is available for $30,000/year (payable to RCA) plus the cost of the service vendors' resources.

RCA also offers a three-day training course, at $600/trainee, the spokesman said from the company's Government Systems Division, Moorestown, N.J. 08057.

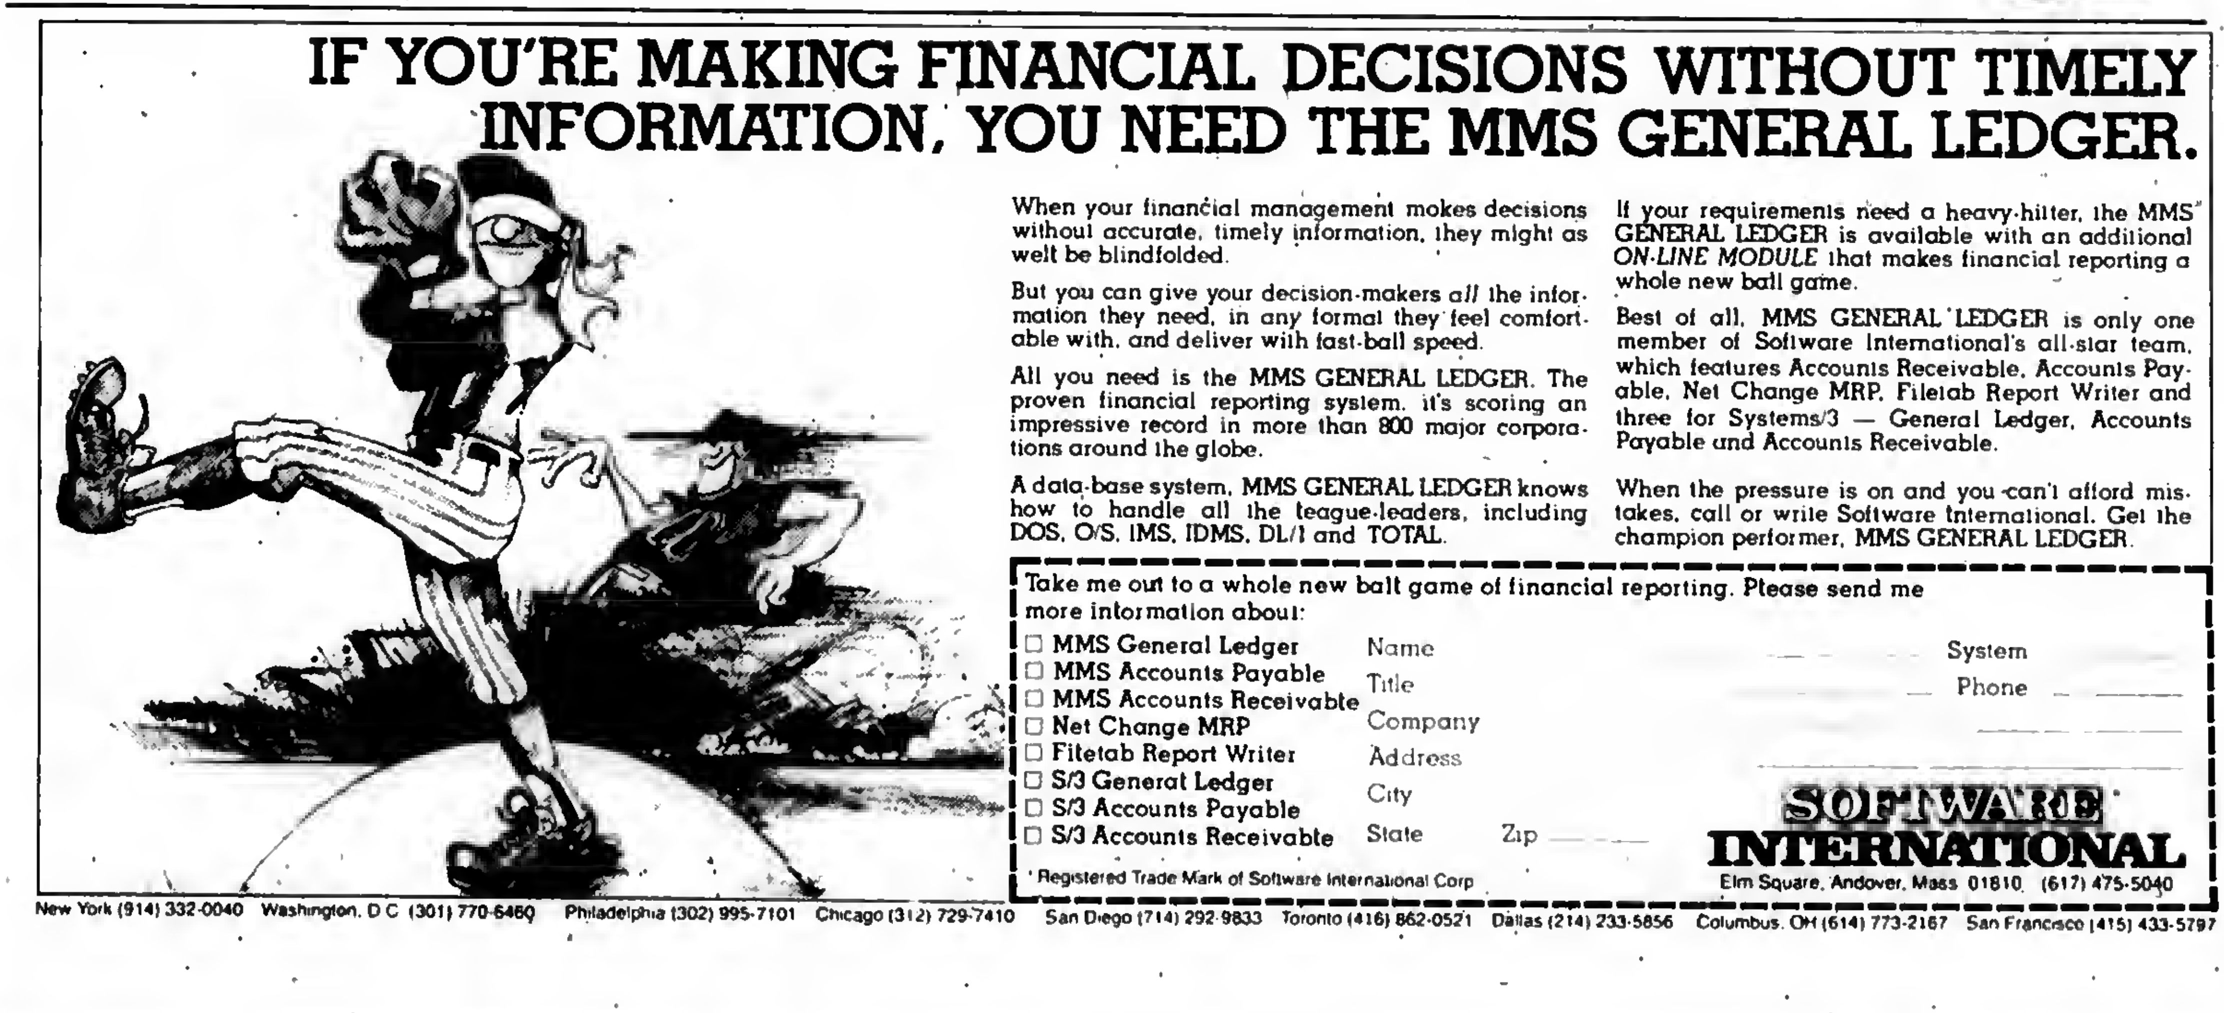
Package Eases Quick Chores

NATICK, Mass. — The Info-32 package from Henco, Inc. has been described by the vendor as a data entry/inquiry/report generator system based on a minicomputer. It enables users to conversationally gather, organize and maintain information, a spokesman explained.

The system supports the storage of both data files and processing routines, either of which can be accessed by name. Once in use, the data can be refined through selection criteria and the processing can be modified to meet new needs, letting the user work with what he wants, the spokesman added.

Written principally in Fortran, the system has been implemented on Honeywell Level 6 and Interdata minicomputers and on an Amdahl mainframe, according to the company.

Info-32 is available for a one-time cost of $4,000, or for $1,500 plus $150/mo for 24 months, Henco said from 215 Oak St., Natick, Mass. 01760..



IF YOU'RE MAKING FINANCIAL DECISIONS WITHOUT TIMELY INFORMATION, YOU NEED THE MMS GENERAL LEDGER.

When your financial management makes decisions without accurate, timely information, they might as well be blindfolded.

But you can give your decision-makers *all* the information they need, in any format they feel comfortable with, and deliver with fast-ball speed.

All you need is the MMS GENERAL LEDGER. The proven financial reporting system, it's scoring an impressive record in more than 800 major corporations around the globe.

A data-base system, MMS GENERAL LEDGER knows how to handle all the league-leaders, including DOS, O/S, IMS, IDMS, DL/1 and TOTAL.

If your requirements need a heavy-hitter, the MMS GENERAL LEDGER is available with an additional *ON-LINE MODULE* that makes financial reporting a whole new ball game.

Best of all, MMS GENERAL LEDGER is only one member of Software International's all-star team, which features Accounts Receivable, Accounts Payable, Net Change MRP, Filetab Report Writer and three for Systems/3 — General Ledger, Accounts Payable and Accounts Receivable.

When the pressure is on and you can't afford mistakes, call or write Software International. Get the champion performer, MMS GENERAL LEDGER.

Take me out to a whole new ball game of financial reporting. Please send me more information about:

THE "SYSTEM"

The software systems house business is rough and tough, an extremely competitive marketplace. One with little margin for error. **Century Computer Corporation** has been in business only e few years. Yet, more and more software systems houses are becoming Century Computer sales representatives. **WHY?**

☐ **TOOLS.** Up to 512K internal storage. Up to 256 ports. 10 to 300M disc drives. 200 to 600 LPM printers. Powerful operating system software, comprehensive programming languages. Turn-key applications packages.

☐ **RELIABILITY!** Century Computer's mainframe maintenance is *free!* Period. Now that's quality. Quality only we provide. The others say they do, then turn around and charge $150 to $350 per month for mainframe maintenance. Makes you wonder, doesn't it?

☐ **SUPPORT.** Complete documentation, both hardware and software. Thorough training for operators, programmers, and maintenance personnel. National and local advertising. Ongoing research and development, aimed at increasing efficiency and reducing costs.

☐ **VALUE.** Century Computer's O.E.M. prices are low, extremely competitive. Coupled with our free mainframe maintenance, low initial cost makes Century Computer Corporation systems easily the best values ever. Bar none.

Why not hook up with a winning combination? Unlock the door to systems sales you had to turn down because of price considerations. Contact: Steve Sharrock, **Century Computer Corporation**, 2339 Stanwell Circle, Concord, Ca. 94520, (415) 798-8000.

IN SYSTEMS-HOUSES

'Roscoe' Update Adds Vtam And Basic Compiler Option

PRINCETON, N.J. — Version 4 of Roscoe, the conversational remote job entry software from Applied Data Research, Inc. (ADR), is said to include more editing commands, Vtam support for IBM 3270s, closer links with ADR's Librarian and, for an extra fee, a Basic compiler.

The package provides program preparation, testing and maintenance services to personnel working at remote terminals operating under IBM's OS and OS/VS environments. These services include data entry and editing, library storage, syntax checking, job submission and output retrieval, programmed prompting and job stream generation, ADR said.

Changes in the logic of the Active Work Space (AWS) or interactive editing area not only support the new edit commands, but also reduce I/O and increase flexibility in the number of lines that can be manipulated concurrently, a spokesman claimed.

The Vtam support for 3270s includes local linkage, Bisynchronous and Synchronous Data Link Control (SDLC) protocols, the company said.

The Immediate-Update Librarian feature is said to support maintenance of Librarian master files from within the Roscoe region or partition. Described as a reentrant subset of the Librarian package, it is loaded under Roscoe command control and supports "all common Librarian functions," the spokesman stated.

The Minibasic special option is a "code-and-go" implementation of Dartmouth Basic which runs as a Roscoe monitor routine.

Programs best suited to Minibasic are those whose processing is mainly conversational with I/O generally restricted to working with the terminal, according to ADR.

Version 4 of Roscoe is available for a one-time cost of $28,000. Minibasic costs an additional $4,500 under the same arrangements. Each is also available under rental or lease plans.

ADR is at Rt. 206 Center, Princeton, N.J. 08540.

Tymshare Adds Personnel Runs

CUPERTINO, Calif. — The Personnel Evaluation and Reporting System (Pers) on the Tymshare, Inc. remote computing network can help personnel analysts and management run a company's Affirmative Action program and produce reports required by federal authorities, Tymshare said.

Pers accepts a firm's Affirmative Action data in raw form and transforms it into standard Equal Employment Opportunity Commission (EEOC) information reports. Other available reports include detailed rosters for internal monitoring and updating, a spokesman added.

But Pers is more than a compliance tool, he said, claiming it provides accurate, timely reporting and analysis to enhance management control of human resources and to increase staff productivity with minimal clerical effort.

The system enables users to access census data and data bases on industry salary levels. In addition, the network has personnel consultants available to help users structure and perform analyses and interpret data, the spokesman noted.

Tymshare's nationwide network is based at 20705 Valley Green Drive, Cupertino, Calif. 95014.

Cosmic 'Pert Time' Runs on CDC CPU

ATHENS, Ga. — Pert Time III, now available from Cosmic, is a program evaluation review technique (Pert) system for Control Data Corp. 6000 CPUs that monitors and schedules various activities within a particular project through use of a time-oriented network structure.

The package accepts data from cards, tape or data cell and produces 21 fixed reports and as many as 20 variable reports, schedule and resource plots and an updated activity tape or data cell, according to a Cosmic spokesman.

Formally cataloged as LAR-11887/-CW, the package requires 52K octal plus 1K octal for each 230 activities or events. It operates in batch mode, has a plotting option using a California Computer Products, Inc. plotter, is distributed on NOS internal format tape and costs $930.

Cosmic is at 112 Barrow Hall, University of Georgia, Athens, Ga. 30602.

Project Control System Revised

LOS ANGELES — J. Toellner & Associates has introduced an enhanced version of its Spectrum-2 multivolume set of project management and documentation guidelines for DP shops with modestly sized staffs.

The update includes all required standards, forms and procedures for the development of new systems and the maintenance of existing ones, a spokeswoman claimed. The estimating guidelines for large and small projects, originally published in Toellner's Spectrum-1 series for large staffs, are included in this version of Spectrum-2, she said.

Spectrum-1 is a 20-volume set of loose-leaf books, each focusing on the needs of a particular position or function within an organization. Spectrum-2 is smaller in scope, with material from Spectrum-1 compressed or eliminated to make the series more appropriate to the smaller staff, she explained.

Spectrum-1 support includes 150 hours of consulting work; Spectrum-2 provides 40 hours of implementation assistance to train the user staff, set up management priority committees, alter the procedures to local conventions and get the first few projects going.

Spectrum-2 costs vary with the size of the user staff. The system is available beginning at $10,000 (for staffs up to 10 in number) to $22,000 (for groups of 20 to 25), she said from 4311 Wilshire Blvd., Los Angeles, Calif. 90010.

Perkin-Elmer:
System Integration by Design

Our design engineers spend a lot of time talking to each other. In fact, we insist on it.

Thanks to all the talk at the drawing boards, we can offer you systems that perform. At peak efficiency.

We realize that the more fully you can utilize the power of your system, the happier you'll be.

That's why we design every single product to suit the system. And every system to optimize its parts.

Perkin-Elmer Data Systems designs and builds a complete line of minicomputers from our Interdata division; mass storage devices from our Wangco division; and I/O terminals from our Terminals division. They're all designed for system integration.

Excellent price/performance. Complete software. Field-proven hardware. Integrated sales and service. Worldwide customer support. Perkin-Elmer Data Systems supplies the tools and support you need.

Give us a call at our toll-free number: (800) 631-2154. We have a lot to talk about.

PERKIN ELMER DATA SYSTEMS

Modeling System Leads to Savings Formula

BIRMINGHAM, Ala. — Today's business environment is just too complex to base million-dollar decisions on gut-level feelings. Each year more and more variable, often uncontrollable conditions cloud management's view of where a company is today and where it's heading.

Today, many decision makers use a modeling program as a tool to weight alternatives and meet these challenges.

One such example can be seen at Vulcan Materials Chemicals Divison, a relatively young member of the parent Vulcan Materials Co., headquartered here, and one of the nation's leading producers of industrial chemicals.

The division, which markets a diversified line of chlorinated solvents, including carbon tetrachloride, chloroform and perchloroethane, accounted for almost two-thirds — nearly $35 million — of total company earnings last year.

Remote Service

As part of its effort to continue this success, the division is now using the Mathematical Programming System (MPS), a modeling capability on the General Electric remote computing network, to examine alternatives for day-to-day decisions as well as long-range planning.

"The chemicals industry is dynamic and highly competitive," according to Ray Heyd, manager of marketing research and the man responsible for the divison's use of MPS. "Today's decisions may have a dramatic effect on tomorrow's business climate, even to the point of survival."

This is particularly true of Vulcan's primary product line, the so-called commodity chemicals used in the cleaning of metals and textiles and as intermediate chemicals in the manufacture of other products.

"Commodity chemicals are generally high-volume and low-margin types of products, Heyd said. "But we feel our modeing capabilities give the division an added edge against competition."

Vulcan's success-oriented management guides the operations of chemical plants in Wichita, Kan., Denver City, Texas, and Geismar, La. Although only about 15% of its modeling system is completed, manufacturing process changes tested by the system have helped establish a trend toward increased profits, Heyd said.

Charles E. Sturgeon, vice-president of manufacturing for the division, noted "a method for increasing profits by more than $6,000 a day has been analyzed and put into operation at our Wichita plant. While we regard this as a great success, the net effect in terms of increased efficiency and profits at other plants could be even more significant."

Such a dramatic increase in plant profitability as a result of manufacturing process changes was, according to Heyd, "something Sturgeon had a feel for from the beginning, but modeling allowed us to test his idea for a matter of dollars rather than the large capital investment necessary for plant modifications."

Optimistic About Future

Heyd is optimistic about future successes. "We've really only scratched the surface," he said. "We have many other plants which can be modeled just as in Wichita with similar results."

Sturgeon also sees the system as a boon to the division's business. "We've involved in a number of very important 'what-if' games that hinge on our ability to discern the best possible alternatives," he said. "Ultimately, our models will be used throughout the division, providing us with an integrated optimization planning system of almost unlimited potential."

In addition to modeling production processes, Vulcan

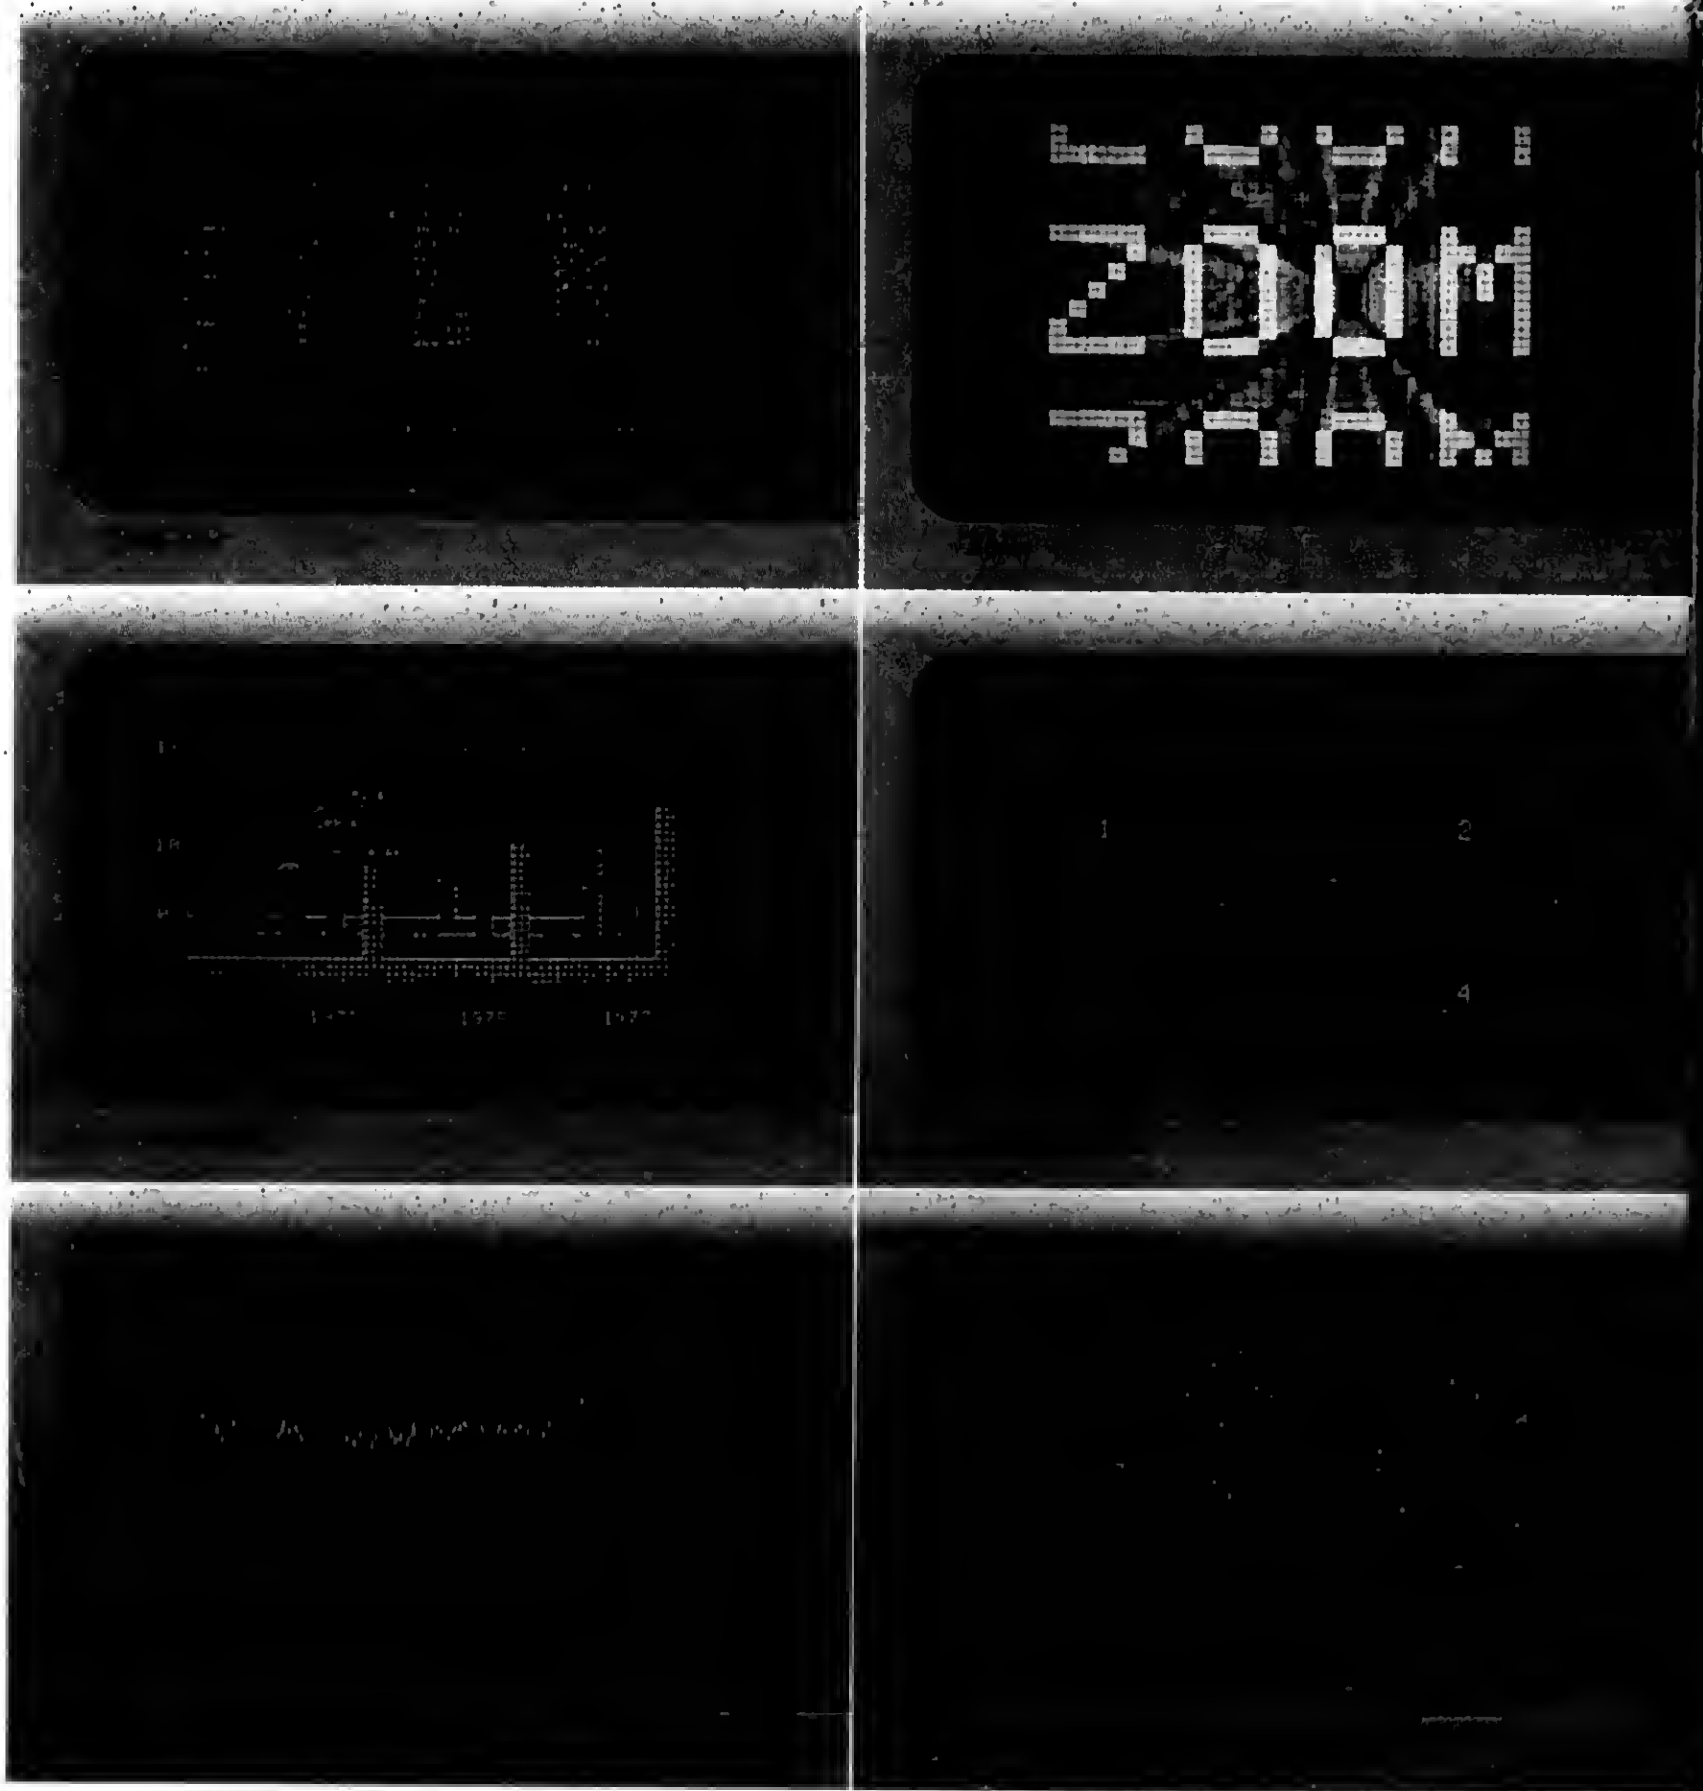
Hewlett-Packard brings a bright new look to low-cost graphics.



'Vserv' Maps DOS Disks

COSTA MESA, Calif. — Keyed to IBM DOS and DOS1-VS installations, the Vserv package scans volume tables of contents (Vtoc) to allow more efficient space allocation and support a "definitive" management of direct access storage devices, according to its vendor, Management Systems Co. (MSC).

The software solves disk management problems by providing a "comprehensive" device mapping facility and Vtoc access capabilities, according to a spokesman. The options allow the user to identify wasted disk space.

Vserv consists of a 15K program and a B transient, distributed on magnetic tape. A user guide is "self-generated" by the Genserv macro included in this $400 package, MSC said from 3185-D Airway Ave., Costa Mesa, Calif. 92626.

A Model Approach

Planning System Brings Savings

(Continued from Page 18)

hopes to also examine plant expansion alternatives with the system, Heyd said.

"The expense of building a new plant vs. adding facilities to an established plant can be measured by mathematical simulation on the system at minimal cost," he said. "Of course, this becomes a particularly important capability with escalating construction costs."

Also of concern for Vulcan is the effect of increasingly stringent environmental controls. Here, the ability to analyze and quickly adjust to changing environmental factors is critical, Heyd explained, giving as an example the uncertain future of fluorocarbons in aerosol use, which could affect the production of several of Vulcan's products.

Another area which benefits from Vulcan's far-reaching system is the choice of raw material feed stocks used in manufacturing chemicals. "Our model can now help us determine where we can get the best buy for our investment," Heyd said, "and the result is the optimal choice of feed stocks."

Vulcan's modeling system will continue to expand, according to Heyd. Scheduled for operation in the near future is a transportation matrix which will further enhance the division's efficiency and profit potential.

"Basically, the transportation matrix will allow us additional input in determining the manufacturing of shipping points for a certain chemical depending upon the location of the user. That way, transportation costs can be significantly reduced while at the same time increasing our ability to quickly serve customers," Heyd noted.

Vulcan management decided on the Mark III service after studying a variety of available processing alternatives, Heyd said. "Even our in-house processing could not match GE's economy of use."

Cassette Course Links DP, Audits

WOODLAND HILLS, Calif. — An integrated DP and audit control approach is said to be the backbone of the Auditable Internal Control Systems (Audics) audio cassette training program from Info 3.

The package is aimed at management, financial staffs, DP users, auditors and DP professionals. It shows each of these groups the needs of the others, the vendor said.

More information about the 12-booklet/10-audio cassette course is available from Info 3, 21241 Ventura Blvd., Woodland Hills, Calif. 91364.

The new Hewlett-Packard Graphics Terminal uses a microprocessor and raster scan technology to combine high performance with low cost.

The HP 2648A introduces a whole range of bright ideas to graphics. There's so much power built into the terminal itself that you can perform everything from auto-plots to zoom without any CPU help at all.

Auto-Plot. You don't need to know programming or invest in costly software. Once you've entered your facts and figures from the alphanumeric keyboard, press a few keys and your tabular data is plotted instantly.

Raster Scan. No more pulling down the blind to make your plots visible. Our display is clear and easy to read even in bright light. And the raster scan technology permits selective erase, cutting down the time it takes to modify your picture also.

Zoom and Pan. This lets you magnify any area of the display up to 16 times. And you can pan in any direction for closeup investigation of complex designs, without having to reinitialize the data.

Area Shading and Pattern Definition. This makes it easy to distinguish areas with similar shapes, such as bar charts, mechanical parts and architectural drawings.

Rubber-band Line. You can draw trial sketches, such as architectural floor plans, with or without CPU connection. Think of the time and money you'll save by cutting down mistakes.

Independent Display Memories. Both alphanumeric and graphic data can be shown independently or at the same time. And you can carry on a dialogue with the CPU without disturbing the picture.

The HP 2648A also has all the advantages of our popular HP 2645A alphanumeric terminal. Specifically: mass-storage on 110K byte cartridges (you can store graphics as well as data); 'soft keys' to speed up repetitive jobs; one-button self-test; plug-in PC boards for easy maintenance; extensive data communication and off-line capabilities.

This bright new look in graphic terminals is designed for such applications as electrical, mechanical and architectural design. For process and control. For scientific plots. And for business planning.

We'd like to give you a graphic demonstration of everything the HP 2648A can do. Send us the coupon and we'll set it up. Or contact the nearest Hewlett-Packard sales office listed in the White Pages. We're sure you'll get the picture.

ARE YOUR PROGRAMMERS ON-LINE

OR IN LINE?

If you have already made the move to do online program development and maintenance, you know about the wasted time and clerical functions you have eliminated by being able to test, debug and text edit programs via the terminal. Because Pansophic is a company dedicated to programmer efficiency, we have developed PANVALET/ON-LINE to optimize your online programming efforts.

Working through CICS, PANVALET/ON-LINE provides new tools that streamline the editing, display and processing of programs, while the program library is protected at all times. A complete hard copy audit trail of library change activity is produced automatically. And PANVALET security, control, compression, management reporting, level numbers and backup are all capabilities of PANVALET/ON-LINE.

Across all industries, people in the IBM 360/370 environment USE Pansophic products . . . because they work and because they offer practical solutions to real problems. Call or write today for further information on our complete line of proven software products.

Data Briefs

SBS Earth Station Set For Third IBM Site

McLEAN, Va. — Satellite Business Systems (SBS) has applied to the Federal Communications Commission (FCC) to construct an earth station on IBM premises at Research Triangle Park, N.C.

When completed in mid-November, it will be the third earth station in the preoperational program of SBS, which is an IBM, Comsat General Corp. and Aetna Casualty and Surety Co. joint venture.

Along with existing SBS earth stations at IBM sites in Poughkeepsie, N.Y., and Los Gatos, Calif., the station near Raleigh, N.C., will be used for common carrier, private line, voice and high-speed data communications services to IBM, according to an SBS spokesman at headquarters here.

SBS plans to begin the common carrier services to IBM by the beginning of next year. The preoperational program is a prelude to the carrier's full operational system of satellites and earth stations, scheduled for completion by late 1980, SBS stated.

Centronics Adds APL Set

HUDSON, N.H. — Centronics Data Computer Corp. has added an AL character set and engraved APL keyboard option for its Model 761 keyboard send/receive and receive-only teleprinters.

The option features a nine-pin print head that produces 7 by 9 dot-matrix characters with underscore and ascenders and descenders on the primary Ascii character set, according to a spokesman.

The APL option adds $450 to the price of a Model 761, he said from Hudson, N.H. 03051.

Omnitec Adds Acoustic Coupler

PHOENIX — Omnitec Data Corp. has added the Model 401D acoustic coupler to its acoustic coupler and modem product line.

The 401D can transmit at 450 bit/sec and optionally at 600 bit/sec. It has RS-232 and current-loop line interfaces in one connector; half- and full-duplex transmission capabilities are shown by indicator lights, Omnitec stated.

The coupler sells for $320, the company said from 2405 S. 20th St., Phoenix, Ariz. 85034.

Survey Finds Users Like Private Facilities Best

By John P. Hebert
CW Staff

DELRAN, N.J. — Although data communications users' first love is privately built facilities, users of both Western Union International (WUI) and MCI Telecommunications Corp. services said those facilities were almost as good overall.

According to a recent Datapro Research Corp. survey report called "All About Data Communications Facilities," the WUI and MCI user ratings came within small fractions of a percentage point of each other and of privately built facilities on a four-point scale in the categories of installation ease, operational reliability and promptness of repair.

The results on user experience are contained in the 29-page report, which also describes and analyzes the communications services supplied by the telephone companies and other common carriers.

The survey of communications users drew 809 usable responses reflecting experience with more than 10,000 communications links over an aggregate network of two million miles, according to the research firm.

User responses were assigned numerical equivalents for ratings from poor (1) to excellent (4) and were converted to weighted averages for all users of each carrier or facility type.

Reliability of Operation

Grouped together, the specialized common carriers were rated as good as the Bell System in the category of reliability of operation (3.1), although WUI and privately built facilities gathered most points from users with ratings of 3.4 and 3.5 respectively, ac-

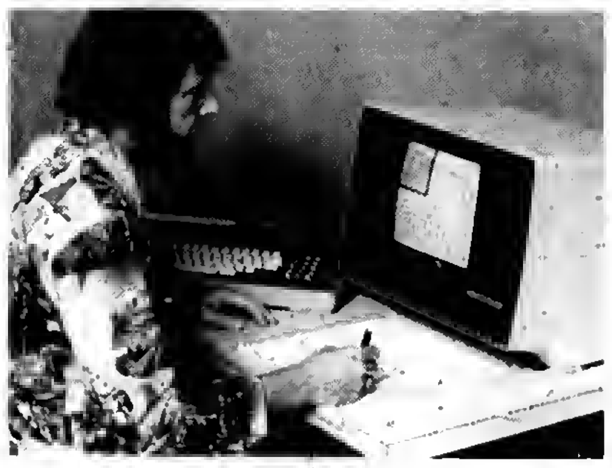
Nugraphics Raster Scan CRT Touted as Tektronix Alternative

SANTA CLARA, Calif. — Nugraphics has unveiled the Cluster 1000 CRT graphics display terminal, designed as a raster scan technology alternative to the storage display terminals made by Tektronix, Inc.

The CRT presently can be used with the Data General Corp. Nova 2 CPU, Nugraphics stated.



Cluster 1000 With Optional Tablet

The Cluster 1000 uses 1M bit of random-access memory in an Intel Corp. 8080 microprocessor to refresh its digital CRT display at 60 Hz, according to a spokesman.

The basic terminal includes an IBM 2741-type keyboard with 20 function keys for cursor, picture and other control functions; the CRT; and an RS-232 interface.

The 416 by 312 picture element image is treated as a movable camera, viewing the 1K by 1K-bit picture data base. As such, the spokesman explained, only initial picture loading and permanent changes require attention from the host CPU.

The graphics terminal features local implementation of panning, zooming from 1X to 8X, multiple split screens, write-through and background grids, Nugraphics stated.

In addition, up to 16 Cluster 1000s can share a parallel port on one host CPU with the addition of an optional interface.

The Cluster 1000s are capable of bidirectional data transfer through the parallel interface data channel at speeds of 66.6 kbyte/sec or higher, Nugraphics claimed.

Each of the terminals internally buffer 512 bytes of data for efficient use of the data

NOW, LEAR SIEGLER AND BURROUGHS ARE ON SPEAKING TERMS.

You're probably very happy with your Burroughs mainframe.

But you'd undoubtedly like to have the versatility and dependability of Lear Siegler terminals. If only they were compatible with your present system.

Now they are. Complete with standard Burroughs polling and address line disciplines.

What's more, the ADM-2B's forms mode capability is compatible with the TD-820.

The ADM-2B gives you full text editing capabilities. Including erase to end of line/field/page. Insert and delete character and line. Blinking and blanking fields. And tabbing.

Just flick a switch and you can convert the ADM-2B to a standard ADM-2 with Burroughs line discipline.

Line diagnostic mode is switch selectable—which makes it extremely valuable for troubleshooting.

Of course, there's all the support that Lear Siegler is famous for. Throughout the United States and in many foreign countries.

$2485.

That's the full price. Including serial printer port. Numeric keypad. 24x80 character screen. 16 function keys. 110-9600 baud. RS232 interface. Burroughs two-wire direct connect is available as an option.

The fact is, Lear Siegler's new ADM-2B terminal gives you the best of both terminals. So you can use it right alongside your present Burroughs terminals and mainframe.

So rest easy, Burroughs users. Because now Lear Siegler speaks your language.

For more information contact:
Lear Siegler, Inc., E.I.D./Data Products, 714 N. Brookhurst St., Anaheim, CA 92803, (800) 854-3805. In California (714) 774-1010.

USTS Files Tariff Changes To Alter Private Line Rates

NEW YORK – U.S. Transmission Systems, Inc. (USTS), a subsidiary of ITT Corp., has filed changes to its tariff with the Federal Communications Commission (FCC) to modify its rate structure for single- and multiple-channel private line service.

The changes are scheduled to be effective Sept. 25, USTS said.

Generally, the rate change will increase rates for short-haul traffic and decrease rates for long-haul traffic. Approximately 65% of USTS customers will receive a rate hike while 35% of the customers will experience decreases, the company said.

Special features of the revised tariff include the addition of three discount mileage rate bands, the incorporation of the channel termination charge into the line haul rate and the elimination of the distinction between two-wire and four-wire local distribution channels, according to the carrier.

The rate changes are expected to increase revenues by approximately 4%, based on the current customer mix.

The line haul rates in the revised tariff utilize eight mileage rate bands and offer customers a range of prices from a $5.90/mile rate for circuits up to 10 miles in length to a flat rate of $770 plus 38 cent/mile for each mile over 1,250.

The change also will reduce the number of multiple channel discount categories from eight to five offering variations at 12-channel intervals beginning at 24 channels and ending at 60 channels, USTS added.

USTS is located at 67 Broad St., N.Y., N.Y. 10004.

RFL Card Aids Remote Tests

BOONTON, N.J. – RFL Industries, Inc. has a loopback circuit card designed to test remote modems and communications lines from a master station.

The 68 Loopback Card operates in conjunction with RFL's Model 6850 and 6385 FSK tone equipment to loop back the digital interface or the communications line at a remote location, according to the firm.

Supervision of the loop back functions is accomplished at the master station by manual or computer-controlled switching, RFL stated.

The 68 Loopback Card can be equipped with TTL, CMOS, MIL, CCITT or EIA interfaces and costs $170 from the firm at Powerville Road, Boonton, N.J. 07005.

Modem Replaces Vadic 3400

PALO ALTO, Calif. – Prentice Corp. has unveiled a two-wire, half- or full-duplex 1,200 bit/sec modem designed to save users money by reducing on-line computer time.

The modem is a cost-effective alternative to the Vadic Corp. 3400, according to Prentice.

Buffered Version

The P-1200-Plus is a buffered version of Prentice's Model 1200/150 modem. Buffering allows simulated 1,200 bit/sec full-duplex transmission over dial-up or two-wire leased lines, according to a spokesman. The unit interfaces with keyboard send/receive KSR types of data entry keyboards in an echoplex environment.

Available in both answer and originate versions, the P-1200-Plus is geared for varying line conditions and replaces existing Bell 103-type modems in higher data rate, interactive applications, the spokesman stated.

The modem operates in any system interfaced with a manual or automatic Data Access Arrangement (DAA) and connects with standard EIA RS-232 or Teletype Corp. compatible adapters.

The price of either version of the P-1200-Plus is $560 from Prentice at 795 San Antonio Road, Palo Alto, Calif. 94303.

Teleray Unit Uses Minidisk

MINNEAPOLIS - Research, Inc.'s Teleray Division has introduced an ASCII floppy disk terminal that uses 5-1/4-in. minidisks for storage and fast random-access retrieval of data, the firm said.

Designated the Model 2020 Teledisk, this unit will store and transmit the equivalent of 37 CRT screens of data (71.68K characters) or 13.5 pages of 8.5 by 11-in. printed material, it added.

Teledisk has two RS-232 interfaces for attachment to any asynchronous Ascli terminal and modem, the company noted.

The 2020 can be operated in read, write, find, insert, erase and address modes with operator prompting; it is compatible with Bell 103, 113 and 202 modems, the firm added.

The unit costs $1,750 from Research at P.O. Box 24064, Minneapolis, Minn. 55424.

Users Like Private Facilities, Datapro Finds

(Continued from Page 21)

cording to Datapro.

Western Union (not WUI) trailed in the reliability category with a rating of 2.7, and the other telephone companies received an overall rating of 2.4.

The 29 users of private facilities said those networks were relatively easy to install (3.4), while the 563 Bell System users gave their facilities' installation a 3.1.

The specialized carriers garnered a 2.9 from their 34 users; Western Union received a 2.7 from 31 users, and the 102 respondents using the other telephone companies' services rated those facilities' installation 2.4.

In terms of repair promptness ("quickness to troubleshoot and correct problems"), the privately built facilities were again given the best rating (3). Specialized carriers took second place with a 2.8, followed by Bell with a 2.7.

User ratings of satellite channels, Canadian facilities and European facilities were also included in the survey results.

Taking the average of weighted averages in all three rating categories, the privately built facilities came out ahead with a score of 3.3. WUI followed with a 3.27 rating, and MCI brought up the rear of the top three with a 3.2.

AT&T's rating from users of its various services was 2.97 in all three categories; satellite channels were next with a 2.93 overall; Southern Pacific Communications Co. received a 2.9 overall; and other specialized carriers had a 2.7.

Western Union was given a 2.63, European facilities a 2.46; Canadian offerings a 2.43; and telephone companies other than the Bell System received the poorest rating overall in all three categories with a 2.33.

Ratings By Services

It is difficult, however, to compare one vendor's offering with those of others, because all are different in at least some ways.

Because of this, Datapro broke out users' ratings for each vendor and types of services offered by each. Bell, for example, was broken down into six different types of facilities or offerings and private facilities were broken down into four separate categories.

In addition, the report also lists all vendors' facilities, rates and service areas grouped in terms of facility type.

Datapro found some usage patterns have changed since the last survey was conducted one year ago. Among those findings: more users are turning to front-end processors to offload the communications functions from the mainframe; and more are employing transmission speeds of 4,800- and 9,600 bit/sec.

"All About Data Communications Facilities" is available for $12 from Datapro at 1805 Underwood Blvd., Delran, N.J. 08075.

Nugraphics Has Raster CRT

(Continued from page 21)

channel in a burst mode, it added.

The RS-232 interface allows communications with the host at speeds up to 9,600 bit/sec under direct memory access through network links, the spokesman noted.

The Cluster 1000 can pan or zoom and add or erase a single item to or from the picture and display and change messages from the host CPU with built-in hardware, according to the firm.

In contrast, the Tektronix 4014 requires a picture redraw to achieve these functions, Nugraphics said.

The Cluster's display tube costs about $100 to replace, while the 4014 storage tube replacement cost is about $2,000, the vendor claimed.

Messages and message changes are displayed on the Cluster monitor through its split-screen technique and reportedly do not interfere with the stored picture or require redrawing.

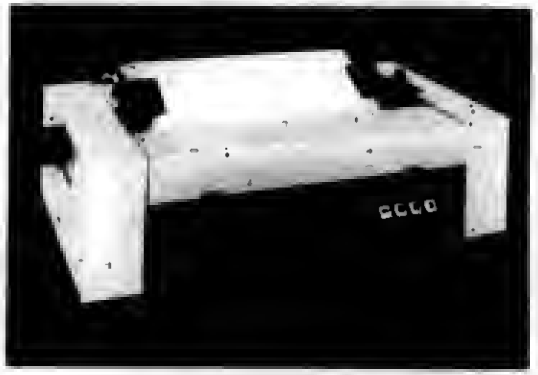
The terminal also offers six different arrangements of split screens containing up to three split areas per screen. The feature, according to the firm, provides for simultaneous display of messages and graphics or of a picture with a zoomed close-up. There is no comparable 4014 feature, Nugraphics claimed.

Cluster Prices

The basic Cluster 1000 is priced at $14,990. A Summagraphics Corp. adapter costing $2,000 facilitates parallel communications to the Nova CPU and also allows up to 16 Cluster 1000s to be daisy chained to one host CPU port, according to the spokesman.

An optional operator station tablet is priced at $3,950. Nugraphics is developing an interface for the Digital Equipment Corp. PDP-11 minicomputer, the spokesman noted from the firm at 3012A Scott Blvd., Santa Clara, Calif. 95050.

Hydra Printers Can Be Used With Any Comm Network Using Any Protocol With Any Interface



The reason is very straightforward. Hydra Ballistic™ matrix printers were designed, right from the beginning, to be fully adaptable to all the varying aspects of communication networks, whether IBM, Univac, Burroughs, Honeywell, or others. Even one of your own design. Consider too that Hydra's staff probably knows more about communication networks than any other manufacturer of printers. Taken together, an excellent combination.

To learn more about our high-performance printers, and our abilities to adapt them to your particular network, give us a ring or drop us a note, and let's talk. Without obligation, of course.

Commercial ECLIPSE Systems. Because a computer should be a vehicle for growth.

For most companies, buying a computer is a big step forward. So you want to be sure the computer you invest in will keep rolling with your company. That's why you want a Data General commercial ECLIPSE data processing system.

Our systems can be expanded in several directions at any time. For instance, as your transaction volume grows, you could move from two to eight, sixteen or more terminals. And as your files and records expand, you could add disc capacity from 10 megabytes and grow to over 1500 megabytes. And with our powerful communications capabilities, system configurations can range all the way up to a multiprocessor network with distributed processors as more applications are added.

Plus our commercial ECLIPSE data processing systems also work easily with larger commercial computers. They use the same high level ANSI '74 COBOL larger systems use, the same language your staff is already used to. So, even if you start with our smallest configuration, you're really beginning farther up the ladder than with any other small computer system.

Data General commercial ECLIPSE systems. They can take the pain out of growing. Now put your future on the line and send for our booklet.

☐ Send me your commercial ECLIPSE brochure, "Smart answers to your data system demands."

☐ Send your brochure and have your sales representative call.

MDS Units Increase Distributed Options

PARSIPPANY, N.J. — Mohawk Data Sciences Corp. (MDS) has added six products for use with its Series 21 product line for distributed data processing applications.

The Series 21 products introduced include:

- An MDS-compatible channel (Feature 180) for linking Series 21 systems directly to other MDS systems.
- The Model 2142-1 printer for 90- to 240 line/min operation.
- The Model 2142-2 printer for 230- to 340 line/min operation.
- The Model 2145 printer for 600 line/min operation.
- The Model 2481 tape drive for 9-track, 800 bit/in. operation.
- The Model 2482 tape drive for 9-track, 1,600 bit/in. operation.

The three higher speed printers will give Series 21 users increased printing flexibility over the current 45 char./sec printer, according to a spokesman. The print speeds on the latest MDS offerings are based on the number of characters printed on each line, as opposed to the number of print positions, he said.

The availabilty of a magnetic tape drive for the system provides Series 21 users with a means of converting diskette records to a CPU-compatible magnetic tape. Auxiliary storage is also provided, the MDS spokesman said.

The MDS-compatible channel allows Series 21 systems to interface directly with larger MDS 1200, 2300 and 2400 systems. This gives users expanded capabilities and the necessary elements for a distributed processing network, he claimed.

The printers range in price from $155/mo for Model 2142-1 and $220/mo for a Model 2142-2 to $440/mo for Model 2145. The Model 2481 tape drive with controller rents for $154/mo; the Model 2482 rents for $212/mo. The MDS-compatible channel costs $18/mo.

All prices are based on a three-year rental contract excluding maintenance, the spokesman noted from 1599 Littleton Road, Parsippany, N.J. 07054.

Bits & Pieces

Forms Burster Boasts Unattended Operation

DAYTON, Ohio — The Standard Register Co. has introduced the Packmaster, a self-powered, relatively high capacity forms stacker. The unit is designed to be part of Standards' Series 1500 forms bursters.

The Packmaster, when used with a Series 1500 burster, permits unattended operation with automatic shut off and preselected forms pack heights up to 15 in., according to a spokesman.

The unit will accommodate one- or two-wide documents in lengths from 3- to 14 in. and widths between 4-1/4- and 19-1/4 in.

The unit sells for $1,310 for factory installation, with field installation costing an additional $96. Standard can be reached at P.O. Box 1167, Dayton, Ohio 45401.

Plotter Controller Bows

HOUSTON — Logic Sciences, Inc. has introduced the MPC-11, a microprocessor-based plotter controller that reportedly allows users to off-load plotter software from host systems.

The unit costs $3,500 with quantity and OEM pricing available from the firm at Suite 412, 6440 Hillcroft, Houston, Texas 77081.

Unit Tests 2314 Types

FULLERTON, Calif. — A device that provides disk pack and disk drive testing on IBM 2314-type disk drives is available from Wilson Laboratories, Inc.

Functions include restore, switch seek, seek incrementing, decrement seek and random patterns of incrementing, according to a spokesman.

The DX-2314 is equipped with 16 bits of error counting with overflow and has a stop-on-error control. The unit sells for $1,995 from the firm at 2536 E. Fender Ave., Fullerton, Calif. 92631.

Tag-Processing Operation Helps Provide Timely Fashion Reports

DALLAS — Neiman-Marcus, known for a unique Christmas catalog and its reputation as a prestigious specialty store, recently implemented a comprehensive merchandising system.

The Fashion Merchandising Management (Famm) system provides fashion-merchandise decision makers at all eight Neiman-Marcus stores with timely information, a spokesman said. Reports provide complete stock status, sales and inventory information by class, style, vendor and other categories.

The majority of information required to produce Famm reports originates in the selling department. Buyers provide the remainder of information required for Famm reports when writing purchase orders and completing price change worksheets.

"There are basically two types of information originating in the selling department — Dennison Corp. merchandise tags and hand-written media," according to Larry Arcury, DP operations manager. All items classified as fashion merchandise have multipart Dennison tags. A tag is detached for each item received into the department, sold to a customer or returned by a customer.

Each type of tag has its own transaction code and need not be kept separate. Tags are spindled in each department and forwarded to Neiman-Marcus' DP center here at the close of each business day.

Rejects Processed

The tags are scanned on a Cummins-Allison Corp. Keyscan system the following day. Data read from the tags is stored on disk. Tags with unreadable characters are rejected into a separate stacker.

An operator processes the rejects at one of Keyscan's CRT/keystations by entering the unscannable characters only. Mutilated tags and handwritten media representing miscellaneous transactions are also key-entered via a CRT/keystation.

Data is transferred from disk to magnetic tape at the end of each day. The data is then transmitted to an IBM 370/158 at the corporate data center in California. Famm processing is completed overnight and reports are generated on a remote printer here.

The Famm system was implemented gradually by Neiman-Marcus beginning in the spring of 1976. "Prior to converting to the new system, we had been using a Cummins-Allison scanner interfaced to an IBM card punch," Arcury said. "While that system worked well for us, we foresaw a change in our requirements in the not-too-distant future that would require us to develop a system with greater efficiency and the ability to process increased volume."

A Cummins-Allison Keyscan system was selected for two basic reasons, he said. First, Neiman-Marcus was familiar with Cummins-Allison equipment since it was part of the existing system.

Secondly, Arcury said, Keyscan provided the speed to process substantially higher volumes and the flexibility to process transactions from both the existing system and the Famm system on an intermixed basis.

"We began our conversion process in May 1976," he recalled. "That process involved eight stores — two here and other stores in Fort Worth, Houston, Atlanta, Bal Harbor; Fla., St. Louis and Northbrook, Ill."

The conversion was completed in November, and it involved 78 departments and more than 1.5 million items. "We beat our timetable for the conversion by nearly six months," Arcury said.

The system includes a 64K-byte processor; a 2.45M-byte disk drive; a 9-channel, 800 bit/in. tape drive; two CRT/keystations; and a tag scanner.

"The system has worked exceptionally well for us," Arcury said. "Our volume has increased by 5%, but we achieve our desired turnaround time and we have only one person working the Keyscan system where our former system required a full-time staff of two.

"In addition, our downtime is less than 2%, and that's a critical factor since our tag-processing volume has increased substantially."

Ticket testing procedures are an important part of the Famm system. Test tickets are produced twice daily on each of the Dennison print/punch machines. These tickets are scanned on the Keyscan to verify accuracy and detect improper punching.

This process immediately identifies problems in the tag-printing operation and assures that accurate, scannable tags are affixed to all merchandise, Arcury explained.

Tape-to-Print System Offered

MELBOURNE, Fla. — Documation, Inc., said it is offering higher levels of off-line impact printing capability with its DOC-TPS tape-to-print system.

Up to four of Documation's line printers can be configured into a system to provide print speeds ranging from 1,250- to 9,000 line/min on a single system. The DOC-TPS operates with one to four industry-compatible tape drives with one central controller, according to a Documation spokesman.

Features of the system include IBM, Burroughs and Honeywell tape compatibility, top-of-form restart and form and line count for job-accounting records.

Twelve different configurations are available with lease rates ranging from approximately $2,600- to $9,573/mo. Documation can be reached at P.O. Box 1240, Melbourne, Fla. 32901.

Merged Technologies — Part 2

Three Alternatives Join COM, On-Line System

By William J. McCullough
Special to CW

There are a variety of alternatives for using computer output microfilm (COM) and on-line systems in conjunction with one another to meet the requirements of a given information system. The best way to determine which alternative to use is to clearly define the requirements of the system and what your organization is willing to pay for it.

The first alternative would be to maintain on-line only the most current or critical information from a data base and put the entire data base on a COM file. Defining current or critical data is a management decision and is dependent on the requirements of the particular system.

An index to all items in the data base would be maintained on-line for rapid access to detail information in the COM file.

This is the second article in a three-part series that looks at the integration of on-line and COM systems by William McCullough, national sales manager for U.S. Datacorp, a COM service organization.

The advantages to this alternative are as follows:

- The COM file would provide backup to the on-line system in the event of computer failure.
- The on-line update capability is maintained.
- The amount of mass storage required for the data base could be reduced substantially, thereby reducing costs.
- Index sequential software, if used for creating the COM file and index, could provide an audit trail on all file activity.

A possible disadvantage to this alternative might be that file inquiry could require two steps.

The next alternative would be to put the entire data base on COM and maintain only the index to the COM file on-line. Retaining the on-line update capability may be a requirement of the system.

The COM file and index could be updated on a daily basis provided you were using a COM service bureau that could provide overnight turnaround or had an in-house COM system.

The advantages of this alternative are the same as those outlined previously, with the added savings in mass storage space.

A third alternative takes us back to the initial planning for the system. After the requirements of the system have been defined and weighed against the cost of an on-line system, does the date base have to be on-line at all?

If the system does not require an on-line update capability, could a current COM system meet the retrieval and display requirements of the proposed system?

If it could, then the third alternative would be a COM system with daily updates.

The primary advantage of a COM-only system would be a dramatic reduction in the time and funds required to implement the system. If the data base already exists, the COM software could be implemented in less than a month, in most cases.

The disadvantage to this alternative would be the absence of an on-line file update at the point of need.

When we discuss distribution relative to on-line systems, we could be talking about one of two things — first, the actual transmission of data to the requesting terminal(s); second, a possible hard-copy follow-up sent via normal channels, e.g. mail, messenger or transmission.

Remote batch work falls into the latter category, even though it is the primary output, simply because it typically means paper, even though it is dependent upon transmission.

Let's look at them one at a time from a pro and con viewpoint.

Data transmission is such an integral part of so many businesses that they would be lost without it. The speed with which these systems function usually pleases us, as customers, very much.

How do you argue with a computer that is hundreds or thousands of miles away? You don't. But if you could see the files being referenced, you could tolerate the waiting time.

How about the paper output of on-line systems? Is it really cost-effective to use a remote batch terminal to print reports which must then go the traditional route of reproduction and distribution? Or to supply hard copies of the data in the on-line files for those "down" times?

The answer to both questions is "certainly not," especially if you were to compute the cost per character to deliver the data to the end user. It is this facet of on-line systems that makes systems analysts look for alternative methods of information dissemination.

Used in conjunction with an on-line system, COM can play a significant role in the distribution of information.

Introducing a smart way to shop for the Dumb Terminal.

It's a data systems showroom (thirteen of them, that is, across the westem United States).

Where, at your leisure, you can try out all the top names in computer terminals and accessories. In fact, we're the West's largest distributor of Lear Siegler terminals. (But we also carry Data General microcomputers and terminals, DECwriters™ and microcomputer systems and Diablo HyTerms.™ Plus a wide selection of couplers, modems, and multiplexers).

Here's how it works:

Just give us a call. We'll help you figure out what equipment and configuration you really need. Then you simply drop by the nearest DSM showroom and see it all for yourself.

DSM makes it easy for you when it comes to money, too. With super low prices. Convenient leasing plans. And the industry's first installment purchase plan.

What's more, our experienced sales staff can easily answer all your questions about data systems.

All of them, that is, except, "Why didn't someone think of this before?"

Data Systems Marketing

Mini Duet Solves Order Entry Problem

By Ann Dooley
CW Staff

SANFORD, Fla. — Harcar, a manufacturer of aluminum windows, doors, bathroom enclosures and related products here, has solved a complicated order entry, inventory and production problem by using two minicomputers.

The system, called Matrix IV, was designed by Technology Applications Laboratory (TAL) of Satellite Beach, Fla. With the two Hewlett-Packard 21MX minicomputers, Harcar can simultaneously enter a customer's order into the data base to all the business functions without reentry, according to an HP spokesman.

Other manufacturers said such a system would require a minimum of 10 disks, but the work is being done on two, according to Carl Schilke, president of Harcar. They also said that even if it were possible, it couldn't be fully functional for nearly two years, Schilke added.

"In fact, the system is simplicity itself. Our employees are having no problems providing us with a tremendous amount of useful, detailed information," he said.

The other manufacturers also wanted to sell Harcar only packaged programs because customized programs would be too expensive. But "TAL was able to design programs for us exclusively," he said.

Previously, everything was handled manually or with the help of a calculator. In the last year and a half, however, Harcar's daily invoice mailing went from 40 to 200 and sales were expected to increase by $1 million each year for the next three years.

"I don't think we could have accommodated this kind of expansion without this system," Schilke said. "I think the paperwork would have been impossible for us to handle manually."

Harcar provides more than 50,000 options from six basic production lines with 168 standard sizes in each line. Component parts are cut from aluminum extrusions 18 to 24 feet long in mill and anodized and bronze finish.

As an order comes in, the customer's identification number is entered and an order form is displayed on a CRT showing any special shipping instructions, the customer's credit rating, the county where he is located and the Harcar salesman in charge of the account.

The shipping dates and products ordered by their parts number are filled in by an operator. A delivery date is assigned and a delivery ticket is printed; the ticket is sent to the shipping department until the order is ready to be shipped.

All the orders of similar products scheduled for the same shipping date are pulled from the data base by the computer operator at one time in order to produce the products. In other words, the system groups all bronze windows of a certain size together, Schilke explained.

This list is checked against the finished products inventory and the system determines what products need to be manufactured. The minicomputer then goes on to break down these items into their raw material components.

The computer is also programmed to pick out the most advantageous length of extrusion and size of glass for cutting. If the best

The Turnkey — Part 3

Bottom Line: A Working System

By Vincent Deschamps
Special to CW

A proper implementation procedure will ensure a successful turnkey minicomputer system. Bear in mind the bottom line is that the system should work.

The vendor should be paid if the system works, but not until he can prove it will work.

A good deal on the wrong system is not a good deal.

Keep your system simple. Don't start with a system that is over-engineered or provides more power or capabilities that you may require in the next five years.

Base your decision on what you *want* the system to immediately do; what you *really need* the system to immediately do; and what you want your system to be able to do in three months, six months, one year and two years after installation.

The following are some recommended implementation procedures for turnkey systems to be stipulated by contract:

- Require a "no-obligation," preliminary sales proposal from the vendor.
- Based on the proposed system configuration of hardware and software, a deposit of more than 10% of the hardware and 40% of the software costs would be appropriate. The deposit should be returnable.
- Upon receipt of your deposit, obtain a commitment from the vendor to have one of his system analysts visit your offices to generate a *detailed* system definition. Allow 30 to 90 days for this analysis to be performed.
- Upon completion of the above analysis, a detailed system definition should be presented for your approval. If you do not approve it, your deposit must be returned and you should not be under further obligation to all vendors and lessors.

If you do approve the detailed systems definition, the vendor should begin programming the system and provide benchmarks and a timetable before the start of programming.

- Once the applications programs are completed, insist upon a systems test at the vendor's facilities, using sample test data

(Continued on Page 28)

Implementation Schedule

Function	Responsibility	Date
1. Financial & Technical Review	Hardware and Software	On Contract
2. Sales Agreement Signed	Customer	On Contract
3. A Deposit Check	Customer	Contract + 14 Days
4. Schedule Planning Meeting	Vendor and Customer	Contract + 60 Days
5. Detail the Specifications	Vendor and Customer	Contract + 75 Days
6. Prepare the Specifications	Vendor	Contract + 90 Days
7. Specification Approval	Customer	Contract + 180 Days
8. Write Application Programs	Vendor	Contract + 180 Days
9. System Demonstration at Vendor	Vendor and Customer	Contract + 180 Days
10. Application Program Acceptance	Customer	Contract + 225 Days
11. Operator Instruction and Documentation Preparation	Vendor	Contract + 225 Days
12. Delivery of Hardware	Vendor	Contract + 230 Days
13. System Installation & Diagnostic Test at Customer Site	Vendor and Customer	Contract + 230 Days
14. System Acceptance and Payment	Customer	Contract + 180 Through 225 Days
15. Preparation of Customer Data	Customer	
16. System Processing.	Customer	Contract + 230 or More Days

This timetable represents a viable schedule of performance by the vendor which the user can insist that he accept as a condition of the sale. Remember, however, that some slippage may occur because of the availability of the time by the user to work with the vendor.

Outcome of Implementation a Working System

(Continued from Page 27)

supplied by you. This test will ensure that the system complies with the specifications that were agreed upon by you and the vendor prior to the programming phase.

- When you have accepted this test, the vendor should prepare operator instructions and documentation for your system. Give him 30 to 45 days to complete this phase. Once they are completed, the vendor should be ready to deliver your hardware.
- The hardware will be installed by maintenance personnel who should also perform diagnostic tests. The latter is a requirement to assure the hardware is functioning properly. Upon completion of the diagnostic tests and your acceptance, you should pay for the system. The vendor should then assist you in the conversion of your existing system or procedures to the newly installed system.
- During the programming stage, forms should be created to be used for preparation of your data as it needs to be converted from your present system to your new system.

An independent source of your choice may be used to convert this information to punched cards or magnetic tape. Either of these media can be loaded onto the system after delivery.

Leasing and Financial Services

While minicomputer systems invariably carry a lower price tag than larger or standard (e.g. IBM 360 series) systems, you should examine the advantages or disadvantages of purchase, lease, rental, financing or other payment plans.

Many minicomputer systems manufacturers do not offer a real leasing plan. As a result, the customer has to find a financing resource which may be a third-party leasing organization, a bank, etc.

There are three basic types of leasing which are available from a few vendors or distributors (most minicomputers usually fall into the first category):

- Financial leasing with full payout over three, four or five years.
- Operating leasing with less than full payment over 24 to 36 months.
- Tax-oriented leasing with effective interest cost. This is usually the best, if large dollars are involved, because it provides leverage for tax purposes and a lower interest rate to the user.

Leasing a system has numerous advantages over purchasing. Leasing does not impact existing bank credit lines and preserves cash because the money to buy is not needed out front.

A leased system can be represented on the balance sheet as a direct expense as opposed to a depreciable asset, which takes seven years to write off. Because the rate of interest a leasee pays remains constant, leasing can be viewed as a hedge against inflation.

Most manufacturers and their distributors provide their own full field service and maintenance contracts. In fact, they usually insist upon having their leased or rented equipment serviced only by their own organization.

Some manufacturers or distributors that have user installations at inconvenient or expensive-to-reach locations either arrange third-party field service or, because of the relative inaccessibility of the site, have to charge more.

This is the final article in a three-part series. Deschamps is president of Turnkey Sales and Leasing, Inc. in New York.

Mini Duo Solves Entry Problem

(Continued from Page 27)

size is unavailable, the next best is selected automatically.

Information about the excess material is stored, ready to be retreived the first time it can be used to fill an order, according to Schilke.

"This gives us tremendous raw material control," he noted. "We're able to locate the best available material quickly and use it with a minimum of waste."

After completing a production run, the system produces an efficiency report indicating the goods produced against the amount of labor required to produce them. In addition, it shows the exact costs of filling each order.

When an order is ready to be shipped, the operator calls the order form up on the CRT screen. If a back order is being filled, the operator fills in the quantity to be shipped and a back order report is prepared to indicate a completed order.

The Matrix IV system also produces management reports including a work order report listing orders by customer and showing daily receipt of new business; buy-out reports listing items on work orders which are nonstandard and need to be purchased; reports listing sales by salesman, county, state, customer and product; and a report listing the average discount given by product and salesman.

"With the two processors, we are achieving the kind of production and inventory control that major corporations have on a larger scale. And we are doing it with three employees who had never seen a computer in their lives until we got this system," Schilke said.

The second computer was added only recently because "we were having a problem scheduling different application work that needed to be done at the same time," according to Nina Pyle, Harcar DP manager.

THE TERMINAL HEADACHE

When you lease a data terminal from RCA, it's like owning one—but without the headaches.

With an RCA lease arrangement, we take on the full responsibility. You get the right terminal to suit your individual requirements. And RCA's expertise is always at your fingertips so you're never at a loss for service.

With data communications specialists in 175 cities and fifteen warehouses coast to coast—you get prompt delivery and fast installation and maintenance. And a 24-hour dispatching service, too. This is the kind of specialized service RCA offers.

At RCA, part of our job is making your job a lot easier. And that's what takes the headaches out of terminal leasing.

Headaches with your terminals? RCA can administer quick relief with third party maintenance.

AND HOW TO CURE IT.

Computer Professionals...

Your career is 1/3. Your life is 2/3.

You'll all like NCR-Wichita.

We provide a state-of-the-art challenge in realtime architecture, develop network design and communication control for distributive processing in a revolutionary data processing minicomputer environment. Here you are given the chance to create and are treated as the unique individual you are. In our metropolitan location, the old west hospitality still prevails. In the midst of modern shopping centers, great restaurants, theatre groups, 52 parks, a solid school system and an opportunity for continuing education at three state universities. You can see the night sky like you have never seen it before and if you like outdoor sports, you will find this location gets your muscles working up to par. The people are friendly, the air clean, the water pure and there is plenty for all. Some of our opportunities are:

COMPILER DESIGN PROGRAMMERS

Serve as a team member for design development documentation testing and enhancing of large compilers.

MINICOMPUTER OPERATING SYSTEMS

Responsible as a team member for design, implementation and testing of interactive general purpose operating systems to support COBOL applications and utilities, written and assembly language.

DIAGNOSTIC DESIGN & PROGRAMMERS

Design, modification and support of diagnostic programs to provide for testing on new mini/micro processor based hardware systems.

SYSTEMS ANALYSTS

Experienced in performance testing and evaluation. Develop testing procedures to evaluate a minicomputer based interactive operating system in the areas of performance and stress conditions.

Complete Computer Systems

An Equal Opportunity Employer M/F

DL11 Replacement Offered

CANTON, Mass. — An asynchronous single-line interface series that replaces the Digital Equipment Corp. PDP-11 system's DL11 interface has been introduced by Gen/-Comp, Inc. here.

The series 2031 asynchronous line interface allows users to interface a CRT or Teletype at transmission rates from 75- to 9,600 bit/sec using a single interface card, the firm said.

The interfaces are software- and hardware-compatible with the PDP-11, the company claimed.

The 2031-01 costs $525 and the 2031-02 costs $575 from Gen/Com at 6 Algonquin Road, Canton, Mass. 02021.

Aviv Designs PDP-11 Tape Controller

BEDFORD, Mass. — Aviv Corp.'s Model TFC 802 embedded magnetic tape controller is said to be compatible with all Digital Equipment Corp. PDP-11 minicomputers.

The unit offers both NRZI and/or phase-encoded recording techniques for standard tape drives over a speed range of 12.5- through 125 in./sec, a spokesman said.

The package consists of three boards in a system unit with interconnecting cables to the PDP-11's Unibus and the tape drive. These units are compatible with DEC's RSX-11, RT-11 and disk operating systems, the firm added.

Complete diagnostic software which includes a subset of DEC diagnostics DZTMA Revision H, DZTMB, Revision B and DZTMG Revision C is supplied, the spokesman said.

The controller costs $3,600 from Aviv at 300 Sweetwater Ave., Bedford, Mass. 01730.

MPI Floppy Disk Drive Has Band-Driven Design

SEPULVEDA, Calif. — Micro Peripherals, Inc.'s (MPI) B82 floppy disk drive uses a band-driven design concept similar to that used by IBM for its drives, according to the vendor.

The B82 was designed for both mini- and microcomputer applications and uses standard 8-in. diskettes.

The drive offers up to 6.4M bits per disk for a single-density drive and up to 12.8M bits per disk for a double-density drive. Total storage capacity is 1.6M bytes on a diskette.

The unit's average access time is 91 msec and track-to-track access is 3 msec. Data is transferred at 250 kbit/-sec for single density and 500 kbit/sec for double density, according to MPI.

Both hard- and soft-sector format operation is accommodated. The drive will read or write an IBM-compatible floppy with the appropriate format, the vendor said.

The B82 costs $450; quantity discounts are available, MPI noted from 8724 Woodley, Sepulveda, Calif. 91343.

HIS Ruggedizing Level 6 Machines

WALTHAM, Mass. — Honeywell Information Systems, Inc. has announced ruggedized versions of its Level 6 minicomputers.

Designed for special factory, environmental and military applications, the minis will be available in the third quarter. The systems can be configured with either core or MOS memory, a spokeswoman noted.

A ruggedized 250-byte diskette unit and 240 line/min and 600 line/min printers will also be available for the system; additional rugged peripherals are expected by 1978, HIS said.

A typical system with the 6/36 processor and 16K of MOS memory with error detection and correction costs about $25,000.

Peripherals for synchronous and asynchronous communications lines as well as CRT or teleprinter consoles and up to 64K words of memory will be available, the spokeswoman said from 200 Smith St., Waltham, Mass. 02154.

Bytronix Controllers Fit DG, DCC Minis

FULLERTON, Calif. — Bytronix Corp. is offering two disk controllers, each contained on a single circuit board, for Data General Corp. and Digital Computer Controls, Inc. (DCC) computers.

The Model B234 controller requires one slot of the computer chassis and is both software- and media-compatible with the DG 4234 disk system. It can control up to four drives.

The B234 does not require wire wrapping, use of the external I/O bus connector or an external adapter.

The Model B446 controller is software — media- and pin-compatible with the DCC 116446 disk system and can be interchanged with DCC 116446 controller boards in existing systems, Bytronix said. The B446 will control one or two drives.

The price of either controller is $2,600, Bytronix said from 2751 E. Chapman Ave., Fullerton, Calif. 92631.

COMPUTERWORLD INDEX

SUBSCRIBE TO THE 1977 COMPUTERWORLD INDEX AND GET SIX MONTHS OF REFERENCE INFORMATION FREE.

The new Computerworld Index, published quarterly and cumulative, is an invaluable reference tool for organizations that have a need-to-know about what's going on in the computer world.

The first issue of the Index for example, covers the last six months of 1976, and it includes more than 4,000 entries by subject, author and name of any company mentioned. It breaks topics down into highly usable and convenient categories:

- There are entries by *product or service*, like *PRINTERS*, which has 37 entries in the six-month period covered; or *LEASING*, which has 10.
- There are entries by *industry*, like *INSURANCE*, under which there are 17 entries for various stories on the use of computers in the insurance industry.
- *Types of computer applications* is another way you can look something up in The Index. The category *INVENTORY SYSTEMS*, for example, has 21 entries.
- *Regulatory, security* and *social issues* are also indexed. There are 34 entries under *PRIVACY*, 10 under *PRIVACY ACT* and 9 under *PRIVACY PROTECTION COMMISSION*, for example.
- The Index also makes it easy to look into *legal aspects of computer use* with categories like *LITIGATION*, which has 24 entries in the last six months of 1976.
- Even *foreign countries* are indexed. The category *JAPAN*, for example, has 9 entries.
- . . . and there are *others: KIT COMPUTERS* (the kind you build yourself) are the latest thing, and The Index shows 5 entries. *POINT-OF-SALE SYSTEMS* has 14 entries . . . and there's much, much more.

Company Names, for example, are a very important part of The Index. Looking under IBM, we find *ten* categories:

- IBM GENERAL
- IBM LITIGATION
- IBM SOFTWARE
- IBM SYSTEM 3
- IBM SYSTEM 7
- IBM HARDWARE
- IBM PRICING
- IBM POLICY
- IBM SERIES 1
- IBM SYSTEM 32

Our special, no-risk offer:

Subscribe to one year of the Computerworld Index (4 quarterly issues, published three months after each quarter ends and cumulative) at the regular rate of $150; and we'll send you the Index for the last six months of 1976 FREE. In addition, we'll give you ten days to look over the 1976 Index AT NO OBLIGATION. Should you decide it's not what you need, just return it to us marked "cancel" and we'll cancel your subscription.

COMPUTERWORLD
THE NEWSWEEKLY FOR THE COMPUTER COMMUNITY

CIRCULATION DEPT.

WE INTERRUPT
THIS PUBLICATION
FOR AN IMPORTANT
ANNOUNCEMENT.

TI's new 765

Until now, a portable data terminal operated on-line with its computer via a telephone line.

Now it can operate when you or your phone lines are busy.

Add bubble memory and a terminal can remember while it waits to talk to your computer. That's the beauty of the new *Silent 700** Model 765 Portable Memory Terminal.

You can enter sales and order information using the typewriter-like keyboard all day long.

And store it in the memory that's built right-into your portable unit.

Then you can edit when you have time. And transmit when on-line rates are lower.

Here's an example of how the 765 terminal means business:

A traveling salesman story.
A garment salesman in Atlanta wakes up to a long day that will take him to St. Louis calling on a handful of major department stores. Leaving the house, he grabs his samples and a small compact carrying case. Weighing just 17 pounds, the new Model 765 Portable Memory Terminal includes a keyboard with upper- and lower-case characters, a built-in calculator-style numeric cluster, a quiet 30-characters-per-second non-impact printer, and an accoustic coupler for telephone connection.

Texas Instruments is the first company to put bubble memory in a form you can get your hands on.

The *Silent 700* Model 765 Portable Memory Terminal.

terminal mea

Taking to the air.

Minutes later he reaches the airport and boards his flight. His 765 terminal fits easily under his airline seat. With the revolutionary new dimension of bubble memory, he'll be able to enter and keep sales data without the added bulk and cost of cassette cartridges, floppy discs or paper tapes.

Third floor, sportswear.

Arriving at his first sales call, his memory terminal goes to work. Without connecting to a phone, he begins to enter his orders, prices and delivery commitments. He has at his fingertips a file management system and a powerful operator command mode that will let him easily select a communications mode, configure memory, and enter or edit his orders. And the story stays exciting to the close.

A last-minute change.

Later in his room, he reads back his sales entries, checks his inventory figures and edits a few changes on his hard copy record. Then he ponders the success and commissions of the day that have been stored up in the terminal's memory. The basic 765 terminal comes with 20K bytes of memory storage. And can be expanded to 80K bytes — the equivalent of 16 to 20 fully typed pages.

TEXAS INSTRUMENTS.

ns business.

Later that evening.
With his orders prepared and the phone rates down, he dials up his central computer at his warehouse. The stored data is transmitted at 30 characters per second. And his sales are rung up. Saving time. And saving money.

Small price for remembering.
TI's new 765 is priced at only \$2995†. Additional 20K increments of bubble memory storage are \$500 each. And, of course, quantity discounts and lease programs are also available.

Wrapping up the deal.
The next day, his customer's orders have been processed. And his first deliveries have been packaged for shipment.

TI's new 765 Terminal with bubble memory has sold a good salesman.

Ask TI how the new memory terminal can help your business. Return this coupon today for more information. Or call Terminals and Peripherals Marketing at (713) 494-5115, extension 3286.

Computerworld

Yes! I am interested in the new Model 765/763 terminals with bubble memory.

Bubble Memory...New Technology for Mass Storage
Contained in a small module, bubble memory is an electronic chip that stores digital information by changing the magnetic polarity of tiny areas in the chip called bubbles. The tiny bubbles are actually cylindrical magnetic islands polarized in a direction opposite from that of a film in which the bubbles function. The memory has no moving parts, and because it works magnetically, it retains information even when the power is turned off, a quality particularly important for portable equipment.

Bubble memory has advantages over electro-mechanical mass memory devices such as paper tape, cassettes or floppy discs. This new technology offers solid state reliability, higher access speeds, smaller size, and less weight and power consumption.

The 765 terminal can access any indexed record in memory in less than 15 milliseconds, compared to a search time from several seconds to several minutes for a cassette system. If the data location in the 765 memory is not known (not indexed), the character string search speed is 1000 characters per second, about four times the speed of a cassette search. Compared to a floppy disc, the bubble memory indexed record access time is more than ten times faster, but total data transfer rates are lower.

Also available in Model 763 Memory Terminal.
The 763 terminal, a stationary version of the 765, is available for applications requiring non-volatile memory and text-editing capabilities. The 763 is equipped with TTY or EIA interfaces for external communications. At under 16 pounds, the 763 is a compact unit appropriate for use in any fixed location.

At $2695† — quantity one price — the 763 terminal is another price performance leader from TI.

TI's Model 763 Terminal

Nationwide Sales and Service
Wherever the Models 763 and 765 Memory Terminals are used, the Texas Instruments nationwide network of factory-trained sales and service personnel is available for support. Sales and service offices are located throughout the United States as well as Canada and major countries overseas.

†U.S. Domestic Price.

TEXAS INSTRUMENTS
INCORPORATED

Welcome to Our New World

With this issue, *Computerworld* is starting a new section: Microcomputing.

This weekly feature will cover the latest developments in micro products and software as well as application stories on how hobbyists and others are using the new devices.

Although primarily aimed at the recreational computing market, the section will also cover some business uses of the new devices — particularly where businesses are using off-the-shelf, kit-type computers.

The advent of the microprocessor is changing the face of the computer community, broadening it and making computer power accessible to more people than ever before.

This is happening in two ways: First, microprocessors are being incorporated into more and more products offered to large computer users. These developments will continue to be covered in the other sections of *Computerworld*.

But along with that revolution there is another: Micros are increasingly being used by people in their homes, for enjoyment, not necessarily for business.

The developments in the field are coming fast and furious — yesterday's price breakthrough is old hat today. Hobbyists need up-to-date information on all the latest products, both in the hardware and the software areas.

That's what Microcomputing is all about.

As a weekly news publication, *Computerworld* can provide the timely information needed in such a fast-changing area — new micro hardware and software will be covered here first, just as new products in the other areas of the computer world are covered first.

But along with the latest product information, Microcomputing will also cover applications of the new devices, both for personal and business use.

And that's where you come in. *Computerworld* is interested in reader experiences with microcomputers — either innovative uses or just better ways to program and use some of the standby applications.

So if you're using micros to educate your children — or if they're using them to educate you; if you're using them to program your thermostat, balance your checkbook or just play Star Trek, let us know.

We're interested in all user experiences.

Not for Indexing Recipes

Personal Computers Seen Luxury Only

By Ann Dooley

CW Staff

CAMBRIDGE, Mass. — Although some people are predicting personal computers will sweep the country, "the personal computer market is not the dawn of the computational era," according to William Grinker, executive vice-president of American Used Computer Corp.

Speaking before a group of MIT alumni here recently, Grinker contended personal computers "will never be a mass market success, but more of a luxury item."

Homeowners won't be using them for indexing recipes or other household chores; it's the professionals who will use them in their work, he said.

Grinker emphasized that personal computers are different from the game-playing hobby computers on the market. The hobby market is 10 times larger than the personal computing market, he said.

But cospeaker A.F. (Sonny) Monosson, president of American Used, disagreed, saying that "everyone will have [a personal computer] in their house whether they use it or not."

Monosson noted there is no one definition of a personal computer. In trying to find out what one is, Monosson told the audience, he had asked various people — and no two answers were the same.

The only answer is that whatever computer a person uses is his personal computer, he said.

Most people over age 25 haven't gotten in on the personal computer craze anyhow, he said. They have their favorite standbyes which they use no matter what, he explained.

The personal computing craze began two years ago in California and the cult swept the East, Grinker said. A year ago, American Used opened The Computer Warehouse Store in Boston on a limited basis and has had to keep it open for longer and longer hours to meet the demand, he said.

The personal computing market transacted $1.2 billion dollars in business last year, Grinker stated. Although it might not be able to sustain such a pace, it has expanded rapidly, he said.

No one is sure where any growth will lead, he added. A Southern California Computer Society study found 85% of personal computer use is work-related, he pointed out.

The community from which the personal computer user is drawn consists of 1.5 million people, of which not more than 10% will be permanent users, he estimated. Most will dabble in it for a while, probably swept into the market from the "Christmas hype" that will be occuring this fall, he predicted.

User Profile

Personal computer users will usually be professionals in the computer field, according to Grinker. It is estimated that 400,000 DP professionals, mostly software-oriented types, help make up the market, he said.

Programmers want to own their own computer because they have no control over the computer at work: they can do whatever they want with their personal computer, Grinker said.

The second group of personal computer users is made up of students. It is estimated that as many as 500,000 high school students and college students will be users, Grinker said.

"The most intense hobbyists are not in college, but in high school," he added. "They're really frightening."

The third group in the personal computing market is the experimenters, according to Grinker. Numbering nearly 300,000, they are the ones who become involved on an intellectual level, he said.

And the fourth group includes about 300,000 ham operators, Grinker said.

Personal computer use won't be completely work-related, Grinker acknowledged. The computer could be programmed for several unusual applications, such as a cocktail party model to calculate how expensive the party would be depending on the kind an amount of liquor served.

Another application could include programming the computer to handle and expense account, entering the known expenses and having the computer fill in the rest.

Nothing has really changed in the hardware and software relationship in the last 20 years, Grinker continued. Computers are smaller, cheaper and faster, but they are still incomplete without the software to finish them off, he said.

Zilog Takes Modular Approach, Announces Family of Boards

CUPERTINO, Calif. — Zilog, Inc., has introduced a family of microcomputer boards to offer users a modular approach for building computing and processing systems.

Zilog's MCB series was designed around the firm's Z80 microprocessor unit (MPU) circuit and a single-chip NMOS silicon gate device with a clock rate of 2.5 MHz. Its 158-instruction set includes all of the 8080A and 8085 instructions, a spokesman claimed.

Each of the present boards is bus-compatible and directly interfaces with all other boards in the series, he noted.

Leading off the series is the Z80-MCB microcomputer board. Designed to operate as a single-board computer, it has self-contained memory plus serial and parallel I/O ports.

The Z80-MCB has a capacity of 4K bytes of dynamic random-access memory (RAM) as well as up to 4K bytes of programmable read-only memory (Prom), erasable Prom (Eprom) or masked read-only memory (ROM).

The Z80-MCB, which costs $495, can be expanded to include more I/O and memory by adding other boards in the series. A strapping option allows users to put 16K by 1-bit dynamic RAMs in place of the 4K by 1-bit RAMs, the spokesman said.

The Z80-MDC memory/disk controller board provides users with 12K bytes of dynamic RAM and a floppy disk controller capable of handling up to eight floppy disk drives.

The Z80-MDC has a strapping option for setting start addresses of each 4K-byte page. Sixteen-bit cyclic redundancy checking is also featured, according to the spokesman. The board sells for $795.

16K Bytes of RAM

The Z80-RMB memory board has 16K bytes of RAM and up to eight ROM or Prom chips per board. The strapping option allows memory to reside in any segment of the 64K address space. It costs $750.

Also in the family is the Z80-PMB Prom memory board, providing up to 32K bytes of ROM, Prom or Eprom. Jumper options allow each 16K bytes of memory to reside in any segment of the 64K address space.

The board costs $395, excluding the cost of the Prom chips.

Zilog is located at 10460 Bubb Road, Cupertino, Calif. 95014.

Motorola Puts 8-Bit System Into Kit Form

TEMPE, Ariz. — Motorola Semiconductor Products, Inc. has introduced an 8-bit microcomputer system in kit form.

The Educator II contains an NMOS 8-bit M6800 microprocessor unit (MPU), peripheral interface adapter (PIA), 128 by 8-bit static random-access memory (RAM), two TTL 512 by 4-bit read-only memories (ROM) and a TTL clock circuit.

An executive program residing in the ROMs contains routines for examining and modifying memory locations and MPU registers, servicing interrupts, transferring programs to and from cassette tapes, searching tapes for specific programs and testing the finished kit, according to a spokesman.

The executive uses 14 bytes of RAM for a scratchpad; the remaining 114 bytes are available for user programs.

An optional 128 by 8-bit RAM can be added for larger user programs, the spokesman said, noting the kit contains all necessary parts, with the exception of a power supply, to bring the system "up and running."

Aluminum Case

Educator II is housed in an aluminum case. Front-panel toggle switches and LEDs are used to enter and display machine code.

Edge connectors on the printed circuit board provide an interface to the PIA and the address, data and control buses for system expansion.

Accessories planned for the Educator II include a video display kit, module card rack and power supply, memory modules and applications programs on cassettes, the spokesman said.

Educator II retails for $169.95. Additional 128 by 8-bit RAM costs $19.04 and a power supply kit is priced at $29.95 from the firm at 705 W. 22nd St., Tempe, Ariz. 85282.

Microcomputing Classified Exchange

Your ad can go here, in our new Microcomputing Exchange, for only 80¢ per word. An ad this size, looking just like this, costs only $36. All ads are set in the same size and style. Use the order form below to join the Exchange.

For Southwest 6800

Dual Minifloppy Debuts

SAN ANTONIO, Texas — A dual minifloppy kit designed for its 6800 computer system has been introduced by Southwest Technical Products Corp.

The MF-68 minifloppy disk system includes all of the hardware and software needed to provide a complete dual-disk operating system, according to a spokesman. The system can be expanded to its four-drive limit with an MF-6X expansion kit.

The software provided with the MF-68 includes both disk Basic and a floppy disk operating system. The operating system commands for disk operation include CREATE, SAVE, RUN, LOAD, PURGE, PACK, CATALOGUE, RENAME, INITIALIZE and PATCH.

The MF-68 is offered in kit form only. It includes controller, chassis, cover, power supply, interconnecting cables, assembly instructions, two assembled Shugart minifloppy drives and a diskette with the operating system and disk basic.

The MF-6X expansion kit includes power supply, chassis, cover and two assembled minifloppy drives.

Prices of $995 for the MF-68 and $850 for the MF-6X include prepaid postage. Southwest is at 219 W. Rhapsody, San Antonio, Texas 78216.

Cramer Kit Bows

NEWTON, Mass. — Cramer Electronics, Inc. has introduced a single-chip 16-bit microcomputer kit that sells for less than $600. The kit includes a hardware multiply and divide capability, according to a spokesman.

The Texas Instruments 9900 Cramerkit features 16 1K by 1-bit static random-access memory chips, two 1K by 8-bit erasable programmable read-only memory (Eprom) chips, 128 bits of I/O and an on-board Eprom programmer.

The only two hardware items not included in the package, according to the spokesman, are the power supply and the panel board, which can be purchased separately if needed.

The kit sells for $595 from Cramer Electronics at 85 Wells Ave., Newton, Mass. 02159.

MICROCOMPUTING CLASSIFIED EXCHANGE

This special classified section in solid (non-display) format is designed for people who are working with or interested in microcomputing. Through it, you can buy, sell or swap equipment software or services; contact people with similar interests; start clubs; disseminate information; look for game partners; or send messages to other individuals. As the number of ads increases, this section becomes more useful; so we've tried to make ad placement as simple and inexpensive as possible. Details are as follows:

Ordering: The attached form will serve as the simplest way, we feel, to place your ads in Microcomputing Exchange. Please do not use it for other classified sections of Computerworld. They are display format and have different procedures and rates. Publisher reserves the right to refuse ads for this section, to limit the size of ads placed, and to limit the number of ads placed by any one person or company.

Payment: Must accompany your order. No exceptions. Your check will be accepted.

Copy and Closings: Deadline for copy to be in our hands is Friday, ten days preceding Monday issue. All copy must be submitted in writing (no copy taken over the phone), clearly typed or printed. We cannot be responsible for errors in printing made from illegible copy.

Rates: 80¢ per word. All words set in same size and typeface, up to first five words may be boldface. In making word counts, include name and address. Name of city (New York) or state (New Jersey) counts as two words. Zip code or phone number (including area code) counts as one word. (Publisher reserves right to omit zip code and/or abbreviate words if space is tight.) Count each abbreviation, initial, single figure or group of figures or letters as a word. Symbols such as RAM, CRT, etc. count as one word. Hyphenated words count as two words. No commissions paid to agencies.

Box Numbers: Are available at $5.00 per insertion. Send replies to box numbers to:

Box XXXX

Study Eyes Firmware Changes

Price/Performance Shift Seen Continuing

By Molly Upton
CW Staff

MENLO PARK, Calif. — Price/performance values of large IBM and plug-compatible mainframes will continue to shift throughout the rest of the 1970s, according to a report from Input, Inc., a research firm here.

The resultant values for users and changes in margins and products for manufacturers will have a variety of ramifications, according to Input's predictions.

IBM is likely to introduce more processors of the 3033 ilk, including those that can be tightly coupled; it will also continue to shift functions among hardware, firmware and software, which will make continued compatibility with IBM functions difficult for firms such as Amdahl Corp., Input stated.

"As a long-term strategy, Amdahl must at some time deviate from total compatibility with IBM. The economic impossibility of constantly reacting to all the hardware/-firmware/software tactical announcements from IBM in the large systems arena makes this strategy mandatory," the report contended.

Mass storage systems and communications processors appear to be the most promising areas for Amdahl to expand its product line prior to 1980, Input suggested, adding Fujitsu has product offerings here that would fulfill Amdahl's needs and also allow Fujitsu to achieve market goals in the U.S.

Future Offerings

Input projected IBM will introduce a 3031 and 3032 as well as a 3033 TC1 and 3033 TC2, which are tightly coupled alternatives of the 3033. Compared with the price/-performance of the 370/158-3, using its old price, these machines will offer price/-performance ratios of 2.7, 4.5, 6.5 and 7 respectively, Input said.

Amdahl needs a clear price/performance advantage over comparable IBM systems, Input said. The research firm suggested Amdahl could react to the coming 3032 announcement by adjusting the price of its 470V/6-II to that of the V/5 and lowering the V/5 price to about $2 million.

"This would result in a more reasonable price spread for the 470 line and establish clear price/performance advantages over the IBM line," the report indicated.

Amdahl has yet to respond adequately to the 370 Extended Facility, Input said, but observed "any deviation from compatibility will result in an adverse customer reaction out of all proportion to its true significance."

Along with the increased price/performance ratios of new IBM machines will come a drop in the residual value of current IBM processors, Input noted.

Input forecast the residual values of the 370/158 and 168 will stabilize in the 30% to 35% range near the end of 1978 and drop again early in 1980 because of a new processor family announcement by IBM.

By 1981, the 168's residual value will be about 10% of its 1976 value.

Itel Challenge

The most important challenge confronting Itel Corp. will be the "effective management of its inventory of IBM equipment," the report said. "This single issue will have the greatest impact on Itel's profitability — even more than any of its own products.

"Plug-compatible mainframe makers, like their peripheral supplier counterparts, are going to find out just how expensive it is to keep up with IBM," Input added.

As their profit margins become squeezed, they "must be able to retain IBM compatibility until they achieve a significant user base. This means they must be able to respond to the hardware/firmware/software announcements of IBM, particularly announcements such as the Extended Facility," the report continued.

Others Affected

But plug-compatible manufacturers are not the only ones affected. Although users of the other mainframers indicated they are content, "the price/performance pressure" exerted by the large systems at the top and by minis at the bottom "results in an unsatisfactory competitive situation for medium- and small-scale stand-alone systems," according to Input.

And minicomputer and terminal makers will have their problems maintaining compatibility as IBM moves to its System Network Architecture.

"All mainframe manufacturers will be affected by IBM's emerging hardware/-firmware/software strategy."

IBM Barriers Active and Passive, Economist Tells Antitrust Trial

By Catherine Arnst
CW Staff

NEW YORK — IBM has erected both active and passive entry barriers to prevent competition in the general-purpose and plug-compatible computer markets, according to Dr. Alan K. McAdams, the government's chief economic witness in the U.S. vs. IBM antitrust trial.

Passive barriers are those which already exist in a market when a competitor tries to enter it and are not directed at any one firm. Active barriers are those which "go beyond what is normally expected" by competitors and are directed specifically against a particular firm or market segment, McAdams explained at the trial recently.

Creating a leasing environment in the computer industry and bundling systems and services together are two types of passive barriers IBM has erected, the Cornell University economics professor testified.

The leasing environment provided IBM with the advantage of strict account control and the stability of recurring revenues, he said. However, it requires a new entrant to have large amounts of capital to compete effectively because profitability is deferred for years; this makes it difficult to attract investors, McAdams said.

This has never been a problem for IBM, whch generally has a large cash hoard and is considered an attractive investment by the financial community, he told the court.

By bundling the price of software, maintenance and support with the price of a computer system, IBM was also able to contain competition passively, McAdams said. This method also required new entrants to the market to have large amounts of capital, he added.

The requirement for plug compatibility offered a passive barrier to entry into the peripherals market, but numerous firms managed to enter in spite of that obstacle, McAdams testified. As a result, IBM adopted business strategies that created "very substantial active barriers," he said.

In 1970, when plug-compatible manufac-

CSC Wins Dismissals In Separate Lawsuits

Federal district courts in California and New York have rendered judgments in favor of Computer Sciences Corp. (CSC) in two unrelated law suits. The law suits concerned a stockholders' class action and a charge of patent infringement.

In Los Angeles, the Federal District Court ruled CSC did not violate securities laws in connection with a 1970 earnings projection. A CSC stockholder had claimed the company issued a misleading earnings projection because of the subsequent discontinuance and write-down of its Computicket operations.

The suit, filed in 1970, sought damages of an unspecified amount on behalf of persons who had purchased CSC stock between Jan. 20 and April 3, 1970 and who held the stock beyond the April 3 date.

In the second case, the Federal Court for the Southern District of New York, in dismissing the complaint, ruled CSC's computer-based system for off-track betting in New York City did not infringe on a patent held by Electronic Assistance Corp.

This 1971 suit also sought damages of an unspecified amount. CSC ceased to operate its off-tracking betting system for the city in 1973.

Judge Nixes Univac Award

PHOENIX — A judge here has issued a permanent injunction barring the State of Arizona from awarding a state computer contract to Univac.

The suit arose after Honeywell Information Systems, Inc. contested the award on the basis that its response to the state's request for proposals (RFP) for a system was priced lower [CW, July 25].

HIS 66/85 Deliveries Snagged

MINNEAPOLIS — Honeywell Information Systems, Inc. has announced a delay in initial deliveries of its Model 66/85 large-scale computer because of technical production problems.

The problem is in the new packaging technology of integrated circuits which HIS is planning to use in the system. No details were available.

No new delivery date has been set. HIS does not want to commit itself to a date because it wants to test the entire system again after the packaging problem is solved.

Decision Data Readying Moves With System 4

By Esther Surden
CW Staff

HORSHAM, Pa. — Univac's BC-7 system originated in the back room of a small company here, according to Louis H. Benzing, president of Decision Data Computer Corp.

As Benzing tells it, Univac contacted Decision Data in 1974 about developing a small business system. The firms started a joint venture in which a lot of Decision Data's people joined a special program dubbed Project Acorn.

The project continued until last summer, Benzing said, when Decision Data had some financial difficulties. Under an agreement reached with Univac, the Decision Data people from the project were transferred to the Univac payroll.

But Decision Data retains rights to the device which eventually became the BC-7 and can market it in any way it sees fit.

"We will probably take the product (called System 4) off into a different direction," Benzing noted. "Decision Data is moving very cautiously in this market."

At last count there were 90 companies offering a small business system; and it's obvious that given the choice between Decision Data, a small firm, and Univac, a large company, the user will choose Univac unless Decision Data can offer something that Univac can not, Benzing said.

"We are going to seek out a niche in the market that the big boys are not addressing," he stated.

The firm isn't putting all of its eggs in the small systems basket, however. Its primary business is in the IBM "aftermarket" — that is, the firm provides cheaper or better products than IBM to IBM customers, he claimed.

The company started out in 1969 to provide enhanced card punches and reader equipment for the IBM System 3. Several years later, it became obvious that the same product could be applied to 80-column cards.

The 96-column card readers and punches led to several OEM contracts, including a large one from Burroughs. When IBM decided not to pursue the 96-column card, however, the rest of the industry followed suit, leading to Decision Data's financial problems, he said.

"IBM seldom does anything by mistake," marketing manager Richard L. Schwab added.

In 1975, Decision Data introduced a line of System 3 printers and Mosfet memory and in 1976 followed with 360/370 printers. The company plans to build on its own user base when it begins to market its mini system.

"Key-to-disk is one possibility" in which the firm could sell either directly to its own end users or to OEMs who could add value, Schwab said.

Another option the firm may take with the System 4 is to keep it both batch and interactive because there is a "tremendous installed base that still wants to use cards," he said. With about 6,000 customers, "we are also one of the few companies that is out there in that user base already."

The market the firm serves is very price/performance-oriented, Schwab added. "The users will get interested if you can save them a few dollars; most will be interested if you can prove they won't have a problem with the product; and all are really looking at the performance, the product must increase the total throughput of the system," he said.

Witness Details Market Barriers

(Continued from Page 39)

turers (PCM) were considered viable competitors, IBM established the Cooley task force, which recommended that IBM explore ways of interlocking IBM peripherals to IBM systems through software and system architecture. It also suggested IBM develop peripheral rental and purchase pricing plans that would be competitive and consistent with IBM's product strategy of technical escalation, according to the government's pretrial brief.

Thus, the Cooley task force designed many of the active barriers IBM instituted in this market, McAdams said.

Changing the interface design was one of the active barriers often employed by IBM in the disk and tape drive markets, McAdams said. By changing the interface, IBM forced a competitor to redesign its entire product to ensure it would successfully plug into an IBM CPU.

In the disk drive market, IBM introduced the 2319A disk drive for attachment to the 370/145 to stop further encroachment on its 2314 disk drive base, McAdams said.

IBM's Fixed-Term Plan (FTP) is yet another example of an active barrier to entry, McAdams said. The FTP, instituted in May 1971, offered low rental prices to users who signed long-term leases but it penalized those who canceled before the lease termination date with large termination charges.

The FTP was only available to users for tape drives, disk drives and printers — all products on which IBM met competition. It locked users into IBM products for the length of the lease, effectively protecting those markets from competitive encroachment, he said.

Also, at the end of the two-year plan, most users exercised the purchase option available, he added.

When less computer equals more performance, small really is beautiful.

A special report on *Minicomputers and Small Systems* in the August 29th *Computerworld.*

Minis are now functioning at every level of business and industry, and *Computerworld's* August 29th special report, edited by Esther Surden, will focus on several issues that are currently the subject of widespread discussion and debate in the minicomputer field.
We'll also cover minicomputer hardware in depth — including microcomputers being used in data processing systems. In all, you'll see a variety of applications stories and tutorials on topics like these:

- Programming languages for small business systems — commentary on languages that have the same name but because of the "improvements" added by competing vendors, may have wide variances in operating efficiency.
- How to evaluate technical evaluations — a look at what benchmark tests and product specifications mean.
- The evaluation and selection process — a case study.
- Minicomputer maintenance — analysis of possible methods (vendor maintenance, independent service organizations, and end user self-support) with an eye to cost savings.
- Minicomputers in distributed processing — stand alone and communicating.
- Using minicomputer equipment — including general purpose minis, small business systems, turnkey systems, miniperipherals and microcomputers.

If you're interested in finding new ways to make data processing more useful and cost effective throughout your organization, you should read our special report in our August 29th issue And if you're a mini manufacturer, OEM or systems house who's interested in telling potential customers how your equipment can help them in their jobs — advertise here. Your *Computerworld* salesman can give you complete details. But don't miss the August 12th ad closing date. Call Terry Williams at (617) 965-5800 to reserve space for your ad.

Time Needed to Build Supply

Delay on DAA Registration Seen Fortunate

By John P. Hebert
CW Staff

NEWTON, Mass. — Telecommunications users connecting equipment to the public telephone network would have had a long wait for Data Access Arrangements (DAA) if manufacturers of the devices hadn't won a delay from the Federal Communications Commission (FCC) in late May, according to officials from Elgin Electronics, Inc. of Waterford, Pa.

The FCC's mandatory registration ruling otherwise would have gone into effect on June 1 as scheduled, E. Joseph Seppala, Elgin's marketing manager of telecommunications products, said at a recent press conference here.

The resulting demand for FCC-certified DAAs would have outpaced their supply, Seppala said.

The DAA, or data coupler, interface provides the means of connecting customer-provided equipment with switched telecommunications networks without electrical harm, Seppala explained.

Even though farsighted individuals could have — after the Carterfone Decision in 1968 — predicted registered DAAs would someday become a reality, neither users nor independent DAA manufacturers were prepared for the FCC's mandatory registration process, Seppala indicated.

Fortunately for users and vendors alike, the FCC extended its ruling's full implementation until Jan. 1, 1978.

Not Prepared

The independent manufacturers of DAAs — and users — didn't take the FCC's registration program seriously even by the fall of 1976, although the commission originally intended to implement the registration program the previous spring, Seppala said.

AT&T obtained a court stay delaying the program from the originally scheduled implementation date of April 1, 1976 until January of this year, when it again asked the courts to delay the program until June 1.

But before that implementation target date, DAA manufacturers realized they were unable to fill all of the orders for the protective devices. The vendors asked the FCC to extend the registration date until Jan. 1, 1978, Seppala explained.

When that date finally arrives, barring additional unforeseen delays, AT&T's Western Electric manufacturing subsidiary will probably stop making DAAs because it said it will not be financially practical to register and supply tariffed devices to users, Jack Van Arsdell, vice-president of marketing at Elgin, said.

Even now, users are telling the telephone company to take their DAAs out and telling independent vendors to install their registered units, Seppala said, adding Western Electric's warehouse is becoming overstocked with unregistered data couplers.

But the independent vendors can't keep up with user demand, according to Seppala. "In September or October, manufacturers will be in a better position to supply the equipment," he said.

The reason for this delay, according to Harry A. Montgomery, Elgin vice-president of engineering, is the many steps associated with the FCC registration procedure.

First, a vendor's design engineers must be familiar with Part 68 of the FCC rules. If they aren't, Montgomery said, the company will have trouble registering the equipment.

Secondly, many test steps are required to ensure the unit's protective function. A company can easily spend 80 hours testing each class of unit, which adds up to a substantial investment, Montgomery said.

Once the factory has performed the tests, the test data must be put on paper — the equivalent of another 40 hours, he said.

Then, when the forms are submitted to the FCC with product photos and wiring schematics, they go to the bottom of the pile. Once reviewed, the documentation must be placed in the *Federal Register* to allow for public comments.

A DAA manufacturer must reply to each comment and to each reply. "Then the FCC is satisfied," Montgomery said.

What is the time for that registration procedure? Elgin, for example, applied for the FCC stamp of approval last November and early this month the product was still not registered.

But the result of these involved procedures will benefit users, who should see a drop in today's price of between $100 and $150 to a figure well under $100 in the near future, Seppala added.

In the future, modem manufacturers may follow the example of Vadic Corp., which brought out the first FCC-registered modem [CW, April 4], according to Seppala.

Other manufacturers will probably register modems with discrete, integrated DAAs to offer users a device compatible with the switched network and prevent other vendors from inspecting the circuitry, he said.

Israeli Bank Going IBM

By **Aaron Sittner**
Special to CW

JERUSALEM — The Bank of Israel plans to acquire its own IBM 370/158 system and discontinue subscribing to the services of the "Office Mechanization Center," the Israeli government's central DP unit.

The central bank's director of data operations, Joseph Sarig, said the IBM installation with ancillary equipment would be leased for $1.26 million per year.

The decision to lease the 370/158 followed a recommendation by a three-man committee of bank executives, but without issuance of a public tender, as is customary for acquisition of costly apparatus.

Trade circles report that Burroughs, NCR and Control Data Corp. agents in Israel will protest the skipping of an open tender by the Bank of Israel. They say the decision was "arbitrary and will only reinforce IBM's monopoly on DP operations in Israel."

Want Unbundled Software

Japanese Ready Processor Entries

By **Molly Upton**
CW Staff

TOKYO — Although Fujitsu and other Japanese mainframe makers are expected to react to IBM's pricing and product announcements with new products, they welcome IBM's practice of unbundling software and would like to imitate it, according to *EDP Japan Report* (EDP/JR), a newsletter from International Data Corp.

Fujitsu is expected to announce soon an enhanced version of its M-190. It is reportedly a multiprocessor with four CPUs having a price/-performance 40% greater than that of the IBM 3033, EDP/JR reported.

International News

And Hitachi is reportedly preparing a competitor to the 3033 and Fujitsu's proposed M-190H for introduction this fall.

Smaller Systems

In the smaller systems arena, Fujitsu has used 16K RAMs in main memory of its M-130 and M-140 systems, which it said offer better price/-performance than the 370/-115-2 and 125-2.

Memory cost is about 20% to 30% less than with 4K chips, the firm told EDP/JR. Access time of the new chip is from 200 nsec to 300 nsec, according to the newsletter. First deliveries will be in March.

In addition, Fujitsu may also enhance its M180II and M-160 processors, with price adjustments along the lines of those in the 370 series, according to the newsletter.

Nippon Electric Co. (NEC) and Toshiba will probably also effect price and/or product changes in their lines.

But the financial pressure is already being felt by the domestic makers all of whom provide extensive software services without charge.

"It will simply be impossible for us to announce new hardware systems with price/-performance comparable to IBM's unless we completely unbundle software and hardware prices," one industry executive told EDP/JR.

Japanese users are reluctant to use packages without extensive tailoring by the systems vendor, according to the report.

One Nippon Univac executive explained: "... The average customers in Japan never accept our standard products as they are; we have to make all the necessary modifications so they can use our program products in their own business environment without making any changes whatsoever."

A survey indicated more than 70% of the applications software used in Japan was developed by hardware manufacturers, compared with less than 20% in the U.S.

Fujitsu incurs a loss on its software service, EDP/JR indicated, principally because of its practice of providing all systems software and most applications software without charge.

The firm spends about 10% of its annual computer business sales on software development, but its income from software services is less than half of the expenditures, EDP/JR said.

The newsletter observed "... Some domestic mainframers are welcoming IBM's policy of charging for certain advanced software systems, because they feel it may get Japanese users accustomed to paying for software products, and thus brighten the profit picture for them."

Severe Competition

There is already severe price competition in the Japanese computer market and the rental policy of the Japan Electronic Computer Co. (JECC) provides a further drain on company revenues, the report said.

The JECC, which is the only major computer rental outlet in Japan, was established by the government in order to eliminate the costs incurred by manufacturers in setting up their own rental bases.

However, JECC requires that a manufacturer buy back the machine from JECC at the depreciated value when returned by the user.

The average Japanese computer user upgrades every three years, so a system with a sales value of $1 million, rented through JECC and returned after three years, will cost the manufacturer $460,000, EDP/JR observed.

Thus the cash squeeze is on, and "many domestic mainframers are experiencing great difficulty generating the funds necessary to operate a profitable computer business," the newsletter continued.

Hitachi and other computer firms are now trying to deal directly with their customers who want leases and JECC's profits have fallen 11% in fiscal 1976.

For its part, Hitachi has reduced dependence on JECC from 35% in fiscal 1970 to 5% in 1975, while its own rental business grew from 51% in 1970 to 55% in the first half of 1976, according to the report.

IBM's share of the Japanese market is only 30%, considerably smaller than elsewhere in the world.

The report lists several reasons for IBM's relatively small base, including: unrestricted price competition; users' affinity for free software and their dislike for standardized program products; and the increased facility with which users can switch from one maker's system to another's.

Small Systems Thrive in Canada

By **Bohdan O. Szuprowicz**
Special to CW

Ifip Congress 77 will be held in Toronto, Canada, from Aug. 8 to 12 and because it will attract computer industry notables, scientists and experts from all over the world, it is worthwhile to have some idea of what Canada's computer industry looks like.

According to a recent report of the Computer/Communications Secretariat of the Canadian Department of Communications in Ottawa, the total computer population in Canada at the end of 1976 was estimated at 14,355 systems. Another source, the Arthur D. Little research firm, estimated the value of all the installed computers in Canada at about $2.4 billion.

Most of the computing equipment in Canada, in fact an estimated 95% of total value, is imported from the U.S. By 1981, however, when the total installed equipment value may double, it is expected that a drop of about 3% in cumulative U.S. market share will occur.

Of all computers in Canada, about 8,500 or almost 60%, are very small with annual rental value below $12,000. Installations of such very small machines, many of which are in the intelligent-terminal category, are expected to grow at 26% until 1980 and average 12% through 1985.

IBM's Share

IBM, not surprisingly, enjoys the largest market share in Canada, estimated at about 30% of the total number of installations and probably closer to 60% of the total value of installed equipment. Honeywell, Univac, Control Data Corp., NCR and Burroughs are the major runners-up, although Digital Equipment Corp. traditionally enjoyed a large market share of minicomputer installations.

Among other minicomputer suppliers, Hewlett-Packard, Data General Corp., Interdata and Varian are the leaders, although Philips of the Netherlands and now Nixdorf of West Germany are making significant inroads.

In 1974, Canada imported $519.8 million worth of office equipment, computers and peripherals, but it also exported $286 million of the same products. With a large and rapidly growing domestic market, Canadian computer equipment and services suppliers want to develop as large a domestic computer industry as possible.

Immediate Future

For the immediate future, at stake are several billion dollars of DP expenditures by which the total market will grow between now and 1985.

While hardware business is dominated by U.S. manufacturers, in the DP services areas Canadian companies are well ahead.

There is also a lively stock market in the shares of Canadian computer service companies such as Computel Systems, Comtech Group, Dataline Systems, Multiple Access and Systems Dimensions.

The major concern of the Canadian computer industry is whether, as computer use grows, Canadian suppliers will grow with the market.

Univac Share of Sperry Revenues Hits 45%, Record $1.47 Billion

By Toni Wiseman
CW Staff

BLUE BELL, Pa. — As the largest division of Sperry Rand Corp., Sperry Univac generated nearly 45% of the corporation's revenues and profits in 1976.

Revenues for Univac hit a record of $1.47 billion in 1976, the firm said.

Broken down, 58% of the revenues, or $865 million, was from U.S. business, 35% (including 7% from joint ventures), or $612 million, from international sales.

An examination of the commercial business mix shows 27% attributable to expansions, 30% to new customers (either first-time users or competitive replacement and 43% to replacements and new applications.

Total commercial computer revenues in U.S. markets during the year were $547 million; revenues from U.S. federal government commercial computer installations were $131 million, while business in the private sector, state and local governments generated $416 million, the report noted.

Univac revenues from the OEM/plug-compatible market (PCM) reached $74 million in 1976, an increase of 54% over the $48 million reported in 1975: OEM/PCM bookings rose to $66 million in 1976, a growth of 47% over the prior year.

Worldwide bookings were $1.2 billion in 1976, a 96% increase over the $632 million in bookings recorded in 1971, representing a compound growth rate of 15% for the five-year period, the report said.

At year end, Univac's installed base worldwide was valued at $7.8 billion, it added.

Commercial orders were up by 42% in the quarter over a strong fourth quarter last year and up 12% over a year ago. Computer demand in Europe picked up significantly in the fourth quarter after lagging earlier in the year, according to J. Paul Lyet, Sperry's chariman and chief executive officer.

Order gains for computer systems were spurred by increased worldwide demand and the introduction of several new products such as the large-scale Univac 1100/80 series and the BC/7 small business system, Lyet said. The phase-down of certain office equipment operations continued on schedule and the remaining operations are approaching a break-even position, he noted.

For fiscal 1977, the division expects to meet its objective of an increase of more than 10% in computer revenue and profits, despite the significant impact of an unfavorable foreign currency translation, according to a Univac progress report.

For the year, R&D spending for computers will total about $128 million, the report said, noting R&D spending has grown 120% during the past five fiscal years and totaled $470 million during that period. For the next five years, R&D expenditures are expected to reach nearly $900 million.

The report also noted that the worldwide installed base of Univac general-purpose commercial systems grew 55% from 1972 through 1975, compared to the industry growth of 43%.

DP's Profit Profile

NEW YORK — Corporate profit performance for computer firms during the first quarter of 1977 were up 12% over the year-ago period, slightly ahead of the all-industries average of 11%, but far below, for instance, real estate's 179%, railroads' 42% and tire and rubber's 39%, according to figures compiled by *Business Week* magazine.

The industry had total sales revenues of $9.3 billion, up 10% from a year ago. Earnings were $855.4 million.

Data General saw the greatest growth in revenue, 49%, followed closely by Digital Equipment Corp.'s 48%. While IBM had the largest sales total, $4 billion, its revenues were up only 7% over last year.

In terms of profits, however, Memorex, Honeywell and Nashua were the leaders in gains with 118%, 114% and 99% respectively.

Burroughs' revenues gained 9% and its earnings 17%, while Control Data's gains were 10% and 14% respectively.

HIS Has Strong Second Quarter

MINNEAPOLIS — Honeywell's rental and service revenues from its computer business were up 17.1% over the year-ago second quarter — this following a 14.3% gain in the first quarter.

Worldwide sales, rental and service revenues in the second quarter were $705.2 million compared with $600.6 million in the year-ago quarter.

Earnings rose to $29.6 million or $1.41 per share compared with $19.3 million or 95 cents a share a year ago.

For the first six months, total revenues were $1.4 billion compared with $1.1 billion a year ago. Six-month earnings were $60.5 million, or $2.88 a share, including a $6.4 million extraordinary credit. This compares with 1976 six-month figures of $32.9 million, or $1.63 a share, including a $3.2 credit.

Edson W. Spencer, president and chief executive officer, said all major segments of Honeywell's business contributed to the company's performance. Operating margins in the computer business showed substantial improvement over last year's second quarter.

Spencer said Honeywell's prospects for the remainder of 1977 continue to be excellent and as a result, additional investment strengthening long-term product development will be made.

However, he emphasized that the rate of increase the company achieved in the first two quarters of this year would not be maintained in the second half because the third and fourth quarters of 1977 would be compared with much stronger 1976 periods.

COMPUTER FACILITY
BALTIMORE, MARYLAND

1st class computer facility is available on December 1, 1977 as follows:

- 4500 Sq. Ft. 1st floor, consisting of 2000 sq. ft. raised floor computer room 215 sq. ft. tape vault, 2285 sq. ft. pl office and data preparation area.
- 1800 sq. ft. basement, consisting of 800 sq. ft. finished office area and 1000 sq. ft. of storage space.
- Computer room and tape vault protected from fire by a Fenwal Halon 1301 detection and suppression system.
- Electrical service to computer room consists of two (2) 400 AMP 240 Volt main feeders, plus transformer for 208 Volt system.
- Forty (40) tons of computer room air conditioning from two (2) units.
- Entire facility wired to an outside security system.

Entire facility is in excellent condition. Most equipment is less than two years old.

Tha entire 6300 sq. ft. with all improvements is available on a two-yaar least at $4,000 par month net of utilities and maintanance.

An additional 7800 sq. ft. (4400 recently paneled and carpatad) is available in whole or part and would give tenant occupancy of entire building if desired. Convenient location at I-695 Beltway interchange.

Nickels & Dimes

Total Systems, Inc. has agreed to acquire the assets of Anderson, Clayton & Co.'s **mortgage banking services operations** for an amount not to exceed $250,000.

$ $ $

Computer Sciences agreed in principle to purchase 1.5 million shares of its stock from the Jones Foundaton. The firm also agreed to file a registration statement which will enable the foundation to sell an additional 1.5 million shares through a public offering. The foundation is the principal beneficiary under the will of the late Fletcher Jones, cofounder, chief executive and largest shareholder of Computer Sciences until his death in 1972.

$ $ $

Applied Digital Data plans to buy back some of its stock from time to time, a move resulting from a pause in the firm's search for a company to acquire.

$ $ $

Anacomp has declared a quarterly dividend of 5 cents a share payable Aug. 10 to holders of record July 27.

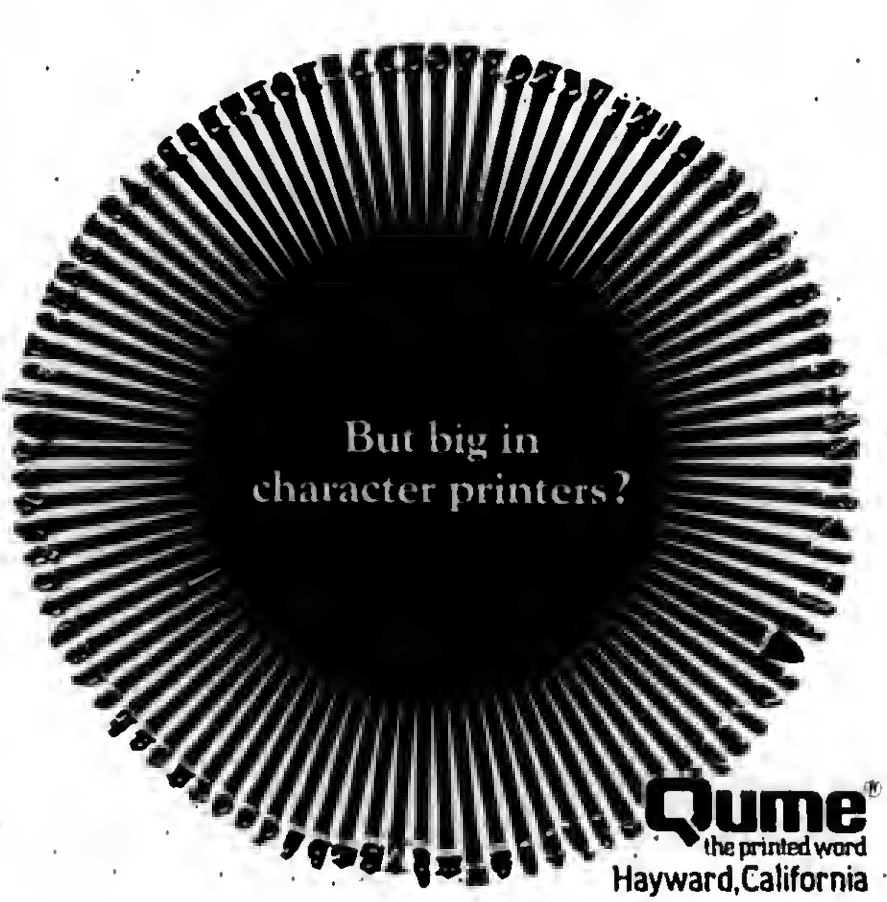
$ $ $

Lexidata has completed a private stock offering to raise additional capital.

$ $ $

National CSS has acquired substantially all of the 50,000 shares of its common stock which it announced its intention to acquire on Jan. 11, 1976.

Almost all of the shares which have been reaquired have been reissued upon exercise of nonqualified stock options or pursuant to the firm's qualified stock purchase plan for employees.



STC 'Super Disk' Sales Enjoy Rapid Growth

LOUISVILLE, Colo. — Two hundred fifty installations and still growing at an accelerating rate — that's the current picture of the installed base for the STC 8800 Super Disk, according to Systems Technology Corp. (STC).

STC, which had revenues of $122 million in 1976, began in 1969 with the production of plug-compatible magnetic tape drive products. Today, the company has more than 15,000 tape drive installations and, except for IBM, is the only manufacturer in the world producing drives with a recording density of 6,250 bit/in.

In 1972, STC conducted a study of storage requirement trends. This led to three basic conclusions:

- Disk devices would continue to increase in capacity.
- Increases in capacity would require performance enhancements.
- As capacity increased, the requirement for removability would decrease.

Heeding these conclusions, the company began development of the Super Disk, a storage device which provides 800M bytes of storage; operates with a four-arm rotary actuator to improve performance; and employs fixed rather than removable media for general use — a "first" for this type of product, according to STC.

Designed to operate with the IBM 360/50 and 65 and all 370 systems in high-volume and low- to medium-activity applications, the Super Disk provides performance that is equal to or better than that of IBM 3330 Model 1 and Model 11 disk subsystems at up to 50% less cost, according to Juan A. Rodriguez, STC vice-president of technology.

"The Super Disk offers 800M bytes of storage within 3330 disk architecture in comparison with 100M bytes for the Model 1 and 200M bytes for the Model 11," Rodriguez stated. "Therefore, the storage device can replace eight Model 1s or four Model 11s."

Five-Year Life

According to Rodriguez, the Super Disk was designed to provide maximum reliability and durability over a five-year, round-the-clock machine life. One of the most important factors behind this long life is the use of 3M Co. disks to prevent crashes caused by head/disk interfaces.

Featuring a coating which is used on all 3M disk products, the disks provide maximum surface coating uniformity and resistance to wear, enabling them to exceed Super Disk reliability and life requirements, Rodriguez said.

Furthermore, in production, STC goes beyond other disk manufacturers in terms of inspection and testing operations, according to W. Mike Deese, product engineering manager, disk products. Every disk, head and other component used in the Super Disk's data storage area is screened and inspected at the unit level before assembly.

Every spindle is screened by means of an acoustic signature analysis and all rotors are individually inspected for evidence of bearing damage, he said.

Following unit testing, Super Disk components are assembled and a burn-in test is run for 48 hours. During this test, a random-access program is run and checks are made for any failures of heat-sensitive parts.

Each Super Disk is then operated in a run-in test which continues for up to six weeks. During this test, designed to simulate an actual computer room environment, the storage device continuously runs a random-access program 24 hours a day, seven days a week.

A final system test includes various diagnostic analyses, after which each Super Disk is approved for shipment.

75 to 100 Users

According to Thomas D. Purtell, disk product manager, production volume deliveries of the STC 8800 Super Disk began in late 1975. Since then, 75 to 100 users have installed 250 Super Disks, and monthly shipments continue to grow.

User surveys indicate the Super Disk is being used for about 75% of data storage in a wide variety of different on-line, random-access applications involving large data bases and low to medium activity.

In remaining high-activity, random-access applications involving sort work, spooling files and basic operating system files, smaller capacity disk subsystems are used.

Product Plans

STC is now marketing an 8350 disk drive with two 317.5M-byte drives, which will be completely plug-compatible with the recently introduced IBM 3350 fixed-media disk drive. In addition, the company plans to introduce 8450 and 8850 Super Disks in the near future which will provide 635M bytes and 1,270M bytes respectively of storage capacity within 3350 disk architecture.

In contrast to the company's plug-to-plug compatible disk drives, STC Super Disks are customized to individual customer needs in terms of formatting data and developing inexpensive, effective backup systems, Purtell said.

Saves Money

"It's important to thoroughly understand the performance characteristics of the Super Disk because it is not simply a plug-in device," Rodriguez pointed out. "Used to its full potential, the unit does more than improve system performance; it saves a lot of money.

"In effect, the Super Disk can accomplish all of the functions of virtual disk storage with much higher performance characteristics and much smaller building blocks of storage capacity," the STC vice-president stated.

"Consequently, the Super Disk not only competes successfully with smaller capacity disk subsystems, but offers great advantages in comparison to a mass storage system, because it enables users to economically and efficiently increase their data base as required."

Contracts

Westinghouse Electric Corp. has been awarded a $12 million contract by Pitney Bowes, Inc. to build a fully automated computer-managed warehouse.

Shugart Associates has received a $5.5 million OEM contract from Standard Electrica SA (Sesa) of Toledo, Spain, the Spanish subsidiary of International Telephone and Telegraph, for Model SA800 floppy disk drives.

Logicon, Inc. has received two contracts, a $4.5 million contract from the Boeing Wichita Co. for the development of a pilot production weapon system trainer for the U.S. Air Force B-52 and KC-135 aircraft, and a $1.1 million contract from the Space and Missile Systems Organization of the Air Force Systems Command.

Moore Systems, Inc. has received a contract in excess of $4 million from the Northeast Utilities Service Co.

Dataproducts Corp. has received a $4.2 million U.S. Navy contract for high-speed teleprinters.

Paradyne Corp. has been awarded a $2.5 million OEM contract from L.M. Ericsson of Sweden for medium- and high-speed modem cards.

Wangco, Inc. has received a $2 million OEM contract for peripheral products from Cobra S.A., Computadores e Sistemos Brasileiros.

Recognition Equipment, Inc.'s subsidiary Recognition Products, Inc. has received a $1.2 million contract from TRW, Inc. for its OCR wand readers.

Conrac Corp. has received a $1.4 million contract from the International Congress Center in West Berlin for display hardware, controllers and digital switching equipment.

Honeywell Information Systems, Inc. has been awarded a contract from the American Society of Travel Agents to conduct a test of a computerized reservation system that will enable travel agents to access several airline reservation systems from a single display terminal.

National Data Corp. has received a contract to furnish its Deposit Reporting System to Bonanza, Burger Chef and Burger King.

Centronics Data Computer Corp. has received two contracts: a two-year contract from Raytheon Data Systems and a five-year contract from International Telephone and Telegraph for computer output printers.

Systems Project Manager

Personnel Applicant Tracking System

Our constant growth and expansion has resulted in a commitment to design and install an applicant tracking system that will serve as an important tool in supporting the employment efforts of the Corporation.

In addition to assuming the design, budgeting, scheduling, hiring, and project management responsibilities for the system, the person we are looking for will also be responsible for supervising the Personnel Systems technical support staff.

Ideally, you have had previous Project management responsibilities involving a large volume of transactions in a multi-location setting and have an in-depth technical background utilizing both small and large scale computers. Knowledge of a sophisticated data base language is desirable.

If you are interested in this responsible high-visibility opportunity, please submit your resume and salary requirements to Randy Shaw, Digital Equipment Corporation, Department G81, 162 Main Street, Maynard, Massachusetts 01754.

We're the company looking for people.

NORTHEAST UTILITIES
OPPORTUNITIES FOR COMPUTER PROFESSIONALS IN-
BUSINESS COMPUTER APPLICATIONS:

SYSTEMS PROGRAMMER

We are seeking Systems Programmers with a TP background to work in a rapidly growing TP environment. We are a 370-168/158 MVS shop with CICS, TSO and TCAM applications.

ANALYST PROGRAMMERS (and above)

We have openings for experienced individuals who have a proven track record in large application systems using advanced IBM 370 hardware and software technology. If you desire to help us ready for the 1980's, if you produce quality systems on time, within budget, within specifications, you may like the challenges.

PROCESS COMPUTER APPLICATIONS:

We are seeking qualified individuals to meet an expanding process computer work load. Our Process Computer Section serves the diverse needs at Northeast Utilities for real-time, sensor-based computer systems. The implementation philosophy is that of an internal systems house with full system supply responsibility; from initial hardware system specification to system functions application through hands-on programming. Two large projects are in the initial project phase. Both utilize multi mini CPU networks, closely coupled, in distributed/hierarchical system configurations. One is an inplant, nuclear powerplant dacqs/monitor system, network software driven, with redundancy through load sharing. The other is a power control center AGC/SCADA system. Color graphic display concepts are employed on both projects.

Applicants shall have up to 3 years experience in process computer application; Engineering degree is essential; familiarity with large process operation and dynamics is desirable.

ENGINEERING COMPUTER APPLICATIONS:

We have an opening in our Computer Systems and Programming Application Section for a qualified individual interested in scientific software development. This Section develops and supports the software requirements of the Transmission and Generation Planning Departments, the Electrical Design, Mechanical and Nuclear engineering Departments and the Distribution and Operating Departments of Northeast Utilities. Presently, programs are implemented on an IBM 370/158 using MVS. All program development is accomplished via IBM 3270 CRT terminals under TSO.

Applicants should have as minimum a BS degree in Engineering or Computer Science, and a working knowledge of either FORTRAN or PL1. Electric utility experience is desirable.

Please apply in writing with educational, employment and salary history to

Computer System & Software Engineers

You can get ahead faster with us than with anybody else.

Here's why:

1 You are needed right now. Our project teams are crying for good professionals who can grab hold fast.

2 You'll get a chance to prove how good you are. Everybody is evaluated regularly; there are no missing persons at TI. If you're good, you move up fast. No matter how long the people above you have been there.

3 You'll be involved in state-of-the-art projects. Air Traffic Control. Satellite navigation systems. Landing systems. Radar and infra-red sensor systems. Computer-aided design, manufacturing and electrical test systems, machine tool control, text processing and process control. Acoustic data and image processing. In addition, an Advanced Software Technology Department has been formed to develop state-of-the-art tools, procedures, and languages for computer system design and software production. TI is the technological leader in literally scores of product fields. This leadership has produced more than 5,000 patents.

4 You'll work on a complete system. No threat of getting locked into a repetitious specialty. You'll work on a small project team. You'll interface daily with other disciplines and other phases of your overall program.

5 You'll work in a job-stable, multi-market situation. We have a variety of products and markets. We're not heavily dependent on any one of them—and neither is your job.

Entry Level or Experienced Openings for U.S. Citizens

Software System Designer
M.S. in Computer Science or Engineering and experience in design of software systems for real-time and interactive systems.

Computer System Engineer
M.S. or PhD in Electrical Engineering or Computer Science and five years experience in hardware and software design of real-time computer systems.

Engineering System Analyst
M.S. or PhD in Math, Physics, Computer Science, or Engineering, and experience in analysis of engineering systems.

Programmers
B.S. in Computer Science, Math, Physics, or Engineering and programming experience with higher order languages such as Fortran, Pascal or PL/I. Both scientific and real-time programmers are required.

Language Processor Designers
M.S. or PhD in Computer Science and three years experience in development of programming languages, compilers, translators, assemblers and link editors.

EDP/MIS CONSULTING

We are a "Big 8" CPA firm with a well established management consulting practice. Our continuing rapid growth has created staff openings in many U.S. offices that provide outstanding career opportunities for EDP/MIS specialists.

Our clients include business, financial, manufacturing, health care and governmental organizations. Typical projects include:

- *Development and implementation of financial and operational information, records and support systems*
- *Performance evaluation and hardware/software feasibility studies*
- *Data systems security and internal control reviews*
- *Long range planning using simulation and other techniques*

Because of our size and number of offices, most of our consultants average less than 20% travel.

To qualify, candidates must have a strong academic background and technical expertise gained from 2-3 years creative experience in one or more project areas. Individuals sought also must have the initiative, inquisitiveness, professional capacity, and people and communication skills necessary to develop into future high quality project and practice leaders.

We offer a starting salary commensurate with ability, education and experience, and an environment in which you will directly influence your future advancement rate. If this appeals to you, send resume with salary history in strictest confidence to:

SENIOR SOFTWARE DEVELOPMENT PROFESSIONAL

Unique Opportunity With Rapidly Expanding Firm

AMS seeks an experienced, creative software development professional to fill a key position in our software development group. This group supports our business by developing generalized software for use in financial, order entry, order processing and inventory control applications.

Starting in 1970, AMS has expanded into a nationwide systems consulting and development firm; annual sales for 1977 are projected at $20 million. To sustain our tremendous growth, AMS has established several large projects for developing software which forms the basis for our proprietary products. At present, our focus in on the DEC PDP-11 using RSX-11M.

The person we seek must have demonstrated success in design and implementation of sophisticated, generlized software such as DBMS, procedural languages, decision-table processors and report writers. The key quality is the creative design and implementation of software which is to be used as the foundation for application products.

AMS salaries are in the upper range for the industry, and the starting salary will be commensurate with experience and qualifications. There is opportunity for rapid advancement, profit sharing and stock options; the working environment is exceptional — a talented, creative team; dedicated computers and terminals.

If you believe you are one of the best in this field, please send us your resume and we will respond promptly. We want to fill this position as soon as possible but not later than September 1.

DATA BASE SYSTEMS

Definition, Planning & Design

Michigan Consolidated Gas Co., the largest natural gas distribution company in Michigan, is looking for innovative problem-solvers with in-depth experience in phased conversion to a data base. Working in a 360/370 environment, you will be responsible for the development of long range systems plans within a data base framework.

Preferred candidates will possess a Master's degree in Computer Science, Systems Management or Management Science with experience in designing software for management systems, including large scale data base. The ability to work independently and good communications skills at all technical and management levels are also important.

We offer a very competitive salary, excellent benefits and the growth potential of a major member of the energy community. Please send your resume including salary history and requirements to N. Shaed, Professional Placement, Michigan Consolidated Gas Company, One Woodward Avenue, Detroit, Michigan 48226. We are an equal opportunity employer m/f.

MICHIGAN CONSOLIDATED GAS COMPANY

The Software Documentation people we're looking for probably aren't looking for a job.

We're the Digital Software Documentation Group, a proud collection of Writers and Editors. We like being part of this organization, not just because Digital is an important computer company, but because we're important to Digital.

We are on an equal footing with the Software Development organization, not a step below it. This is reflected in our salaries, our autonomy, our enthusiasm, and our corporate clout. We're not used to getting a lot of empty promises. What we do get is the necessary funding for our projects and enough freedom to produce the kind of documentation end-users can really sink their teeth into.

We have some of the best software documentation people in the business. And now we want the rest of the best because this group is determined to produce nothing but the highest quality work. We're looking for great Writers, Editors, and Programmers with a flair for writing; people doing fine where they are but who would thrive in an organization that provides a great challenge to grow.

What Do We Offer You?

An opportunity to work for a comany that recognizes the importance of software documentation; to be an integral part of the development team.

An opportunity to work with a highly autonomous, highly charged group, where quality, not volume, is the objective.

An opportunity to experience real freedom, to take what has to be done and put your personal stamp on it.

An opportunity to have real impact on the support group, Digital, and the industry as a whole.

An. opportunity to be catapulted forward in your career and choose your own directions to move in. You can follow either the administriave or technical path of our dual career program. Either way there will be personal satisfaction and, of course, compensation.

If this is the kind of involvement you're looking for – or if you'd just like to learn more about us – let's talk.

Forward your resume to Theresa Buckley, Digital Equipment Corporation, Dept. 8, 162 Main Street, Maynard, Massachusetts 01754.

We're the company looking for people.

ACCOUNTING SOFTWARE FOR DEC RSTS/E CTS-500 USERS

From one of the pioneers in commercial data processing using RSTS. Successful installations in manufacturing, distribution, service bureau uses. Completely on-line, interactive systems. If you are installing or have installed a RSTS/E or CTS-500 system, contact us first for cost-effective solutions in: ACCOUNTS PAYABLE; GENERAL LEDGER; FINANCIAL REPORTING

The design specifications for these packages were developed by accountants for use by accountants. All packages provide excellent audit-trail, extensive user prompting, fast data entry, full file-maintenance and inquiry capabilities, modular design and construction.

These are consolidating packages and support multi-division company and multi-company corporate accounting functions.

Intel delivers more semiconductor memory than anyone. Even IBM.

When you select a computer, it often makes sense to choose IBM. Because of their size, industry acceptance, installed base and technological leadership in computers.

But when it's time to select a memory supplier for your IBM computer, it always makes sense to choose Intel.

For the same reasons.

Intel is the world's largest supplier of semiconductor memory. Over 53 billion bits shipped in 1976 alone. That's more than IBM has shipped domestically during the life of System 370.

We became number one in semiconductor memory by applying marketing strength to technological leadership. Technological leadership is what you expect from the company that invented the world's first microprocessor. And marketing strength is what you expect from the world's largest supplier of microprocessors and semiconductor memory.

Intel's financial strength and security take the risk out of selecting an alternative to IBM. We're over a quarter billion dollars strong.

And we've built an organization to equal — and often surpass — the sales, service, support and confidence you expect from IBM. Intel has over 600 IBM 370 series memories installed at companies like yours.

We could not have made it to number one if we didn't offer you more than IBM. Our memories deliver significant cost savings when compared to IBM memory prices. And we're the only independent supplier to offer a complete line of 370 memories — from System 125 through System 168.

Our memories go beyond compatibility with all IBM features and configurations. Enhancements — such as our unique microprocessor-controlled maintenance and diagnostic features — give you operating flexibility and reliability second to none.

Intel is your logical choice for System 370 memory. So whether you're planning a new 370 installation or upgrading existing capability, talk to Intel. Phone us at (408) 734-8102. Or write: Intel Memory Systems, 1302 N. Mathilda Ave., Sunnyvale, CA 94086.

intel delivers.

First Users Pleased With Itel Swap for IBM CPUs

By Nancy French
And Ronald A. Frank
CW Staff

First users of the Itel Corp. Advanced Systems (AS) series mainframes have experienced few if any problems in replacing their IBM 370 systems, a *Computerworld* survey has found.

In all cases, the Itel mainframes were swapped for their IBM counterparts with minimal effort and the IBM operating software was totally transparent to the AS machines, users said.

Most AS users experienced throughput improvements that confirmed initial estimates and some said the Itel CPUs exceeded original projections.

Dr. Clair Maple, director of Iowa State University's Computation Center, swapped his 2M-byte IBM 370/158 for an AS/5 on May 13 in one of the smoothest conversions he said he's ever seen — "We simply unloaded the 158 and loaded up the AS/5 and kept right on running."

As for the AS/5's performance, "it's the same machine — it's completely equivalent to the IBM 370/158.

"Statistically it's showing up a little better, but I suspect some statistical aberrations are responsible for that — not anything real," he said.

The Computation Center has an unusually large scientific and research workload because the Energy Research and Development Administrations Ames Laboratory is located on the Iowa campus. To handle that load, its 158 had been running as a dual system with an IBM 360/65.

NEWSPAPER

Washington Round-Up

By Edith Holmes, CW Staff

Wiretapping 'Text' Found

WASHINGTON, D.C. — The "in thing" during the Nixon Administration, wiretapping has made a comeback in the form of a federally funded study released here recently by a congressman who is investigating the illegal use of the technique and its resulting privacy invasions.

The study provides a "how-to" lesson in the interception of a suburban residential phone, a business' data communications to a computer service and conversations over the direct dialing network between two individuals in different cities.

The document, obtained and publicized by Rep. John E. Moss (D-Calif.), is "a previously unrevealed third volume of a little

(Continued on Page 4)

HEW Probe Continues

WASHINGTON, D.C. — A $38,300-a-year federal computer project manager has been dismissed by the Department of Health, Education and Welfare (HEW) for allegedly accepting more than $3,000 in meals and trips from a company whose $7.5 million HEW contract he managed.

Edwin B. Parker III, project manager of the HEW Office of Education's automated student loan management system, allegedly received the gratuities and favors from On-Line Systems, Inc., a Pittsburgh-based firm, [CW, July 18].

In the dismissal notice sent to Parker a week ago, HEW stated he would be asked to leave in 30 days in part because he also

(Continued on Page 4)

SSA System Security Hit

WASHINGTON, D.C. — The Social Security Administration's (SSA) communications system that accesses personal information on millions of Americans is open to fraud and unauthorized disclosure of confidential data, according to a government audit recently made public by two members of Congress.

Security procedures and controls for the SSA Data Acquisition and Response System (SSADARS) are "not adequate to prevent fraud and abuse or assure compliance with the requirements of the Privacy Act of 1974," the report by the audit agency of the Department of Health, Education and Welfare

Programmer Productivity Rising Too Slowly: Tanaka

By Nancy French
CW Staff

TORONTO — If the rate of programmer productivity improvement remains at its current 3% per year, by 1985 automated information processing could be the most labor-intensive of all industries with the possible exception of agriculture.

This gloomy prospect was presented in a speech prepared by Dr. Richard I. Tanaka, president of the International Federation for Information Processing (Ifip), as his keynote address for the triennial Ifip Congress 77 which began here today.

In contrast to software costs, the price/performance ratio of hardware has improved by a factor of 100 each decade since 1955 and indications are that this will continue for at least the next decade, Tanaka said.

If these rates do not change, by 1985 90% or more of the costs of data processing will be spent on training and support of the people associated with the equipment rather than on the equipment itself, he warned.

But there will be changes. Developments already on the horizon, which had their beginning with semiconductor technology, will have an important impact on this equation, the international marketing and management consultant indicated.

Microprocessors and standalone systems on one hand and distributed processing systems on the other will affect the software problems now faced.

Microprocessors will be substituted to perform software functions. Portions of large mainframe operating systems could eventually be handled by "subsets of dedicated hardware processors," he said.

Fewer Specialists

As software becomes translated into hardware, the functions available will become standardized to a certain extent, Tanaka forecasted. Some may see this as a limitation, but it will help create "a stabilized set of tools with which to solve problems."

Ultimately this will make computers easier to use and more accessible, both physically and functionally, to users who need not be computer specialists, he said.

This accessibility will expand the use of systms that perform computations at levels previously considered practical only in large installations. The proliferation of small commercial and business systems is one indication of what changes in economics can do, the former California Compter Products, Inc. senior executive said.

A second aspect of accessibility is in distributed processing, using terminals with varying degrees of computer capability interconnected by a communications system. With satellite systems and improvements in other transmissions, communications are becoming relatively independent of distance, he said.

Distributed processing has specific international implications, Tanaka pointed out. There are clear advantages to

(Continued on Page 6)

3033 Delivery Dates Set

ARMONK, N.Y. — While the industry remains in the dark about delivery dates for the IBM 3033, the mainframer has begun enlightening eventual systems recipients.

Specific dates recently went out in a series of letters to customers, according to an IBM spokesman who would only tell *Computerworld* that deliveries will begin in the first quarter of 1978.

Positions in the delivery schedule were determined by taking all orders received during the "first-day order" timeframe and then randomizing and sequencing them in a "fair and equitable fashion, he said.

After the "first day order" period, deliveries were strictly on a first come-first serve basis, he added.

In acknowledging the 3033 orders, IBM required each customer to complete a certification form stating he intends to use the system himself or retain ownership. Prospects were also subject to a preliminary credit check, the spokesman said. These measures were instituted to curb speculative orders.

IBM would not disclose how many letters of intent it had received nor the number of delivery dates it has set.

For Medicaid System

Board Checking Mass. Bid Award

By Don Leavitt
CW Staff

BOSTON — "We've been had. We'd like to see this procurement thrown out and the whole process reopened," the first witness told a review board convened at the State House here late last month to study how the Commonwealth of Massachusetts selected the winning proposal for its Medicaid claims system.

The proposal submitted by Blue Cross of Massachusetts with a subcontract to Electronic Data Systems, Inc. (EDS) of Dallas was selected, but contracts have not yet been signed. The procurement has been challenged since two members of the selection committee have outside business with EDS [CW, Aug. 1].

D. Reid Weedon, senior vice-president of Arthur D. Little, Inc. (ADL), told the review board he was "stunned" by the situation. His company's bid was rejected as nonresponsive, but the challenges could have been "easily cleared up" if the state had met with ADL — "as we asked it to" — to review the apparent deficiencies before the rejection.

The situation was especially surprising, he said, since just weeks before the rejection the state had asked for more time to consider the bids because the selection board wanted to ask several of the bidders some questions. ADL wasn't listed to face questions, so "we were optimistic," Weedon remarked.

The rejection could cost the state as much as $5 million extra over the course of the three-year contract. That, according to Weedon, is the difference between the ADL bid and the $19.5 million proposal from Blue Cross.

Cobol vs. BAL

The three-man review board was organized to determine if the rejections of proposals from ADL and from Citibank were unjustified and discriminatory. Made up of one person from the state's Department of Human Services and two members of the Governor's Advisory Committee on Computers and Data Processing, the board is also supposed to resolve "the Cobol issue."

Most of the bidders said they would write their programs in ANS Cobol since that is specified in the request for proposal (RFP). Blue Cross indicated, however, it will work in BAL with the understanding that it would convert the programs to Cobol whenever they have to be turned over to the state.

Weedon agreed that compliance with the call for Cobol is a "must." He assured Charles Zraket, a vice-president of Mitre Corp. and member of the review board, that ADL would do all of its programming on this project in Cobol.

The reasons the state gave for rejecting the ADL proposal were "technical trivialities," he told Human Services assistant secretary Charles C. Stover, another member of the board. Each bidder was required, for example, to accept the general terms and conditions of the RFP. But whenever ADL attempted to detail its assumptions or to stipulate its intentions to comply — as the RFP provided — the proposal was deemed to be nonresponsive, he said.

ADL failed to include in the technical portion of its proposal a statement accepting the penalty clause condition in the event of missed deadlines. But, Weedon noted, that statement was in the cost portion of the proposal —which the state never opened.

That's where the RFP said the statement should be, he said.

ADL was also faulted for failing to list references. This, Weedon admitted, might almost be a legitimate complaint, but not quite. Ninety percent of the work done by the ADL subsidiary that would handle Medicaid has been with the state.

The RFP itself included a discussion of the welfare program the company has been running for Massachusetts and several members of the selection committee were people with whom the company worked on the project. It therefore seemed superfluous to list that effort, Weedon said.

Following Weedon, Citibank vice-president Alan Newman told the review board he had basically the same reaction to the outright rejection of his company's proposal without benefit of the "normal" oral presentation to clear up possible misunderstandings.

Tenn. Asks End to Tax Suit

NASHVILLE, Tenn. — The State of Tennessee has filed a motion to dismiss the suit that seeks a declaratory judgment on the state's right to tax software filed by Robert M. Sherin [CW, June 27].

The state argued the court lacks jurisdiction over the subject matter of the complaint, which fails to specify a claim upon which relief can be granted.

Tennessee also indicated the plaintiff, Sherin, should pay taxes and then sue for a refund, rather than file a complaint prior to the commencement of the tax.

In his reply to the court, Sherin stressed his suit seeks to enforce constitutional provisions providing for the supremacy of judicial decisions. He refuted many of the state's arguments.

Sherin, president of Nova Computing Services, Inc. of Florida, filed his suit after the legislature voted for a tax on software, although the Tennessee Supreme Court ruled software is intangible and nontaxable under that state's law in the case of Commerce Union Bank vs. George M. Tidwell [CW, Aug. 30].

Withington Admits IBM Ties at Antitrust Trial

By Catherine Arnst
CW Staff

NEW YORK — A government witness who fought a subpoena to testify in the U.S. vs. IBM antitrust trial because of the hardship he said it would cause him may have had other reasons for being reluctant to testify against the industry giant.

Frederick K. Withington, an expert on the computer industry from Arthur D. Little, Inc. (ADL), recently testified he is currently awaiting publication of a book he wrote as part of an IBM-sponsored program.

Further, Withington said he owns 78 shares of stock in IBM valued at approximately $17,000. He obtained his first shares in 1967, but purchased 40 more in August 1976. He appealed his subpoena in March of 1976.

Nevertheless, although Withington was reluctant to take the stand, he has not been reluctant to talk once there.

Environment for Systems Programming; is scheduled for publication by Addison-Wesley, Inc. in January 1978, Withington told the court.

The proposal for the book, conceived in its present form in 1974, was presented to a board of IBM personnel for approval and accepted at that time.

Withington was to have received $12,000 indirectly from IBM, paid through the publisher. Of this sum, $4,000 was an outright grant paid when the proposal was accepted; the balance was an advance against royalties. Withington has received a total of $7,000 of the funds to date.

Publication of the book and the receipt of the $5,000 balance depend on final approval of the completed manuscript by the same IBM board. This has not yet been given.

ADL Balks at Subpoena

After producing approximately 90,000 pages of documents to IBM, ADL attorneys filed a motion with the court to quash an IBM subpoena for further production. Judge David N. Edelstein, the sole arbiter in the case, agreed to delay his decision on that motion until Withington has finished his testimony.

Meanwhile, Withington's testimony as an industry expert has closely paralleled that of Dr. Alan K. McAdams, the government's chief economic adviser for this trial [CW, July 11, 18]. Withington writes an annual report for ADL subscribers on the state of the computer industry and a five-year forecast, and much of his testimony was based on knowledge he gained while writing these reports.

IBM Share 68.4%

From the reports, he drew a chart showing IBM started out with 71% of the general-purpose computer systems market in January 1961 and has 68.4% of that market now. The value of the installed base of general-purpose systems in the U.S. has risen from $1.8 billion in 1961 to $46.5 billion in 1977.

As of January 1977, IBM's next largest competitors were Univac, Honeywell Information Systems, Inc. and Burroughs Corp., each with 7.1% of the market.

The percentages held by Univac and HIS have dropped consistently from 8.9% and 9.1% respectively in 1973, Burroughs, on the other hand, has increased its market share since then by two percentage points.

The only other competitors IBM had in the general-purpose systems market as of January 1977 were Control Data Corp. (3.6%), NCR Corp.(2.6%) and Digital Equipment Corp.(4.1%), according to Withington. Six others have left the market since 1961, he added.

Two Accused Of Passing Tapes To Eastern Bloc

MIAMI — Two men arrested here in conjunction with an alleged plot to transport components of a cruise missile to Soviet agents are also suspected of passing magnetic tapes and microfiche to Eastern Block operatives.

Carl John Heiser, III and Carl Lutz Weischenberg were recently arrested on the technical charge of failing to register as agents of a foreign government and are awaiting trial scheduled for Sept. 26 in Federal District Court here.

The Soviets allegedly were in the market for components of the cruise missile, uranium and 40 aircraft gyroscopes made by Litton Industries, according to an affidavit by FBI special agent Bill J. Windland.

Weischenberg, a West German citizen, is reportedly slated to stand trial in West Germany on charges of high treason for allegedly supplying Soviet Bloc nations with material from West German DP firms.

Heiser, an American, indicated he had grossed between $150,000 and $200,000 in the last year and a half from delivering microfiche orders for IBM, Memorex and Bendix programs or for equipment such as "Bendix computer drive shafts," according to the affidavit.

Some of the materials delivered were IBM tapes for whose delivery an informant received $7,000, but which cost about $497.75 when purchased from IBM, according to the affidavit.

The affidavit did not mention the contents of any of the media and no information was available from the FBI or IBM.

The LIBRARIAN® and MetaCOBOL® from ADR Boost Efficiency at Computer Power, Inc.

Computer Power, Inc., Jacksonville, Florida, provides complete data processing services for a number of banks, mortgage bankers and saving and loans whose mortgage portfolios have over 1,250,000 mortgage loans valued at over 24 billion dollars.

Over 8,400 program modules are now used to provide client services — modules which require storage space equivalent to 2.7 million card images.

Until The LIBRARIAN was installed, program storage and management was an expensive and time consuming problem

According to Technical Support Manager Roy Flieger, "Before we installed The LIBRARIAN, we stored everything on 17 IBM model 2314 disk packs. That meant we had 17 different source statement libraries. We were making 1000 pack changes a month and we were spending over 50 hours of computer time each month reorganizing files."

"Program standardization was a problem too. Programmers would make changes to one pack and not duplicate the changes on the other packs."

The LIBRARIAN enabled Computer Power, Inc., to cut disk storage by 94%.

After The LIBRARIAN was installed 2 years ago the entire source statement library was immediately compressed with the result that Computer Power, Inc., using the IBM 3330 disk system, now stores all of its 8400 program modules on a single disk, constantly on-line. The benefits were far greater than just the savings in disk use, however. Time required for file reallocation was virtually eliminated. Elimination of disk shutdowns and disk changes added another 50 hours a month of usable computer time. And standardization rapidly improved because common program changes no longer had to be duplicated on many different disks.

"We really have file backup now. And that's tremendous."

Roy Fileger remembers, "When we had 17 packs our backup and savings procedures were extremely time consuming. Now, with The LIBRARIAN and only one disk pack, we are able to save everything every single day in just 20 minutes."

ADR's MetaCOBOL is doing more than just conversion.

Computer Power, Inc., is in the final phases of conversion of more than 6000 program modules from DOS to OS/ANS. According to Roy Fileger, "We're running through MetaCOBOL and coming out with state-of-the-art programs, OS/ANS, single entry, single exit with I/O completely changed. All the programs we have converted so far have executed perfectly the first time."

Programs are being standardized as they go through MetaCOBOL.

"Everything coming out is looking alike. MetaCOBOL is picking up errors in violation of COBOL specifications that the compilers would let go through. As a result, our programs are really coming out clean," he continued.

"As far as I know, there is no alternative to MetaCOBOL."

"Any other system would have required handmade changes involving a staggering amount of time," Roy Fileger added.

ADR software products are an integral part of over 5,000 installations worldwide. Each ADR product is not just a program, but a complete package with full documentation and on-site support. ADR is the only software company with 50 branch offices and representatives in 31 countries — each staffed with ADR-trained technicians.

Audit Finds SSA Net Open to Privacy Abuses

(Continued from Page 1)

(HEW) said.

But HEW officials are not aware that SSADARS has been misused, according to Edward W. Stepnick, assistant inspector general for auditing at HEW. In a letter to SSA Commissioner James B. Cardwell, Stepnick said the audit had not attempted to find instances of fraud and abuse, but rather to determine whether the potential for misuse of the SSA system existed.

The importance of security within the system and in the use of its terminals "cannot be overemphasized," the report stressed. Containing records on more than 27 million Americans who receive Social Security and Supplemental Security Income payments, the system employs a network of approximately 2,200 terminals across the country.

The terminals provide a user with the communications link required to transmit data on the beneficiaries of various SSA programs to the agency's headquarters in Baltimore. "The data processed through SSADARS is used to add, delete or change information on the computerized records of any SSA program," the HEW audit report noted.

Released by Representatives John E. Moss (D-Calif.) and Charles Rose (D-N.C.), who have also asked the General Accounting Office (GAO) to look into SSA's computer operations, the audit said the weaknesses found in the system's security procedures and controls "adversely affected SSA's capability to protect the integrity of its systems and prevent a compromise of personal data retained in program records."

Abdication of Security

Among the problems identified by the audit was the abdication of management and security of the SSADARS terminals to each individual SSA central office component. Limited central guidance resulted in insufficient emphasis on terminal security, the HEW study indicated.

Security procedures regarding the terminals varied in detail in different parts of SSA's organization, and the security program was managed by only a few employees located at the lower levels of the agency's organization structure, the report said. Further, these employees were assigned responsibility for security as an addition to their usual workload.

As a result of the lack of management, terminals were located in unsecured and uncontrolled areas and were left unlocked overnight, the report noted. The HEW audit agency visisted 69 of the 72 keystations attached to the 35 SSADARS terminals at SSA's main headquarters in Baltimore and found 33 keystations — almost 50% — were in areas that couldn't be secured during off-hours.

Passwords needed to unlock the terminals were known by an excessive number of employees, the report said. Further, the system was designed in such a way that when an employee unlocked one keystation to a terminal, he unlocked them all.

Reports kept to help management monitor the locking and unlocking of terminals were untimely and inaccurate, making them ineffective as flags to possible system security violations, HEW also found.

Finally, programming logic — designed as internal system security to limit the types of transactions which could be processed by each terminal — was ineffective, the report charged. Use of an alternate mode procedure provided a terminal operator with the ability to process claim or transaction data not authorized by his terminal's assigned identification code, but permitted under another terminal's code.

Although SSA recognized the importance of security controls and was devoting increasing effort to security improvements when HEW conducted its audit in July and August of 1976, more needed to be done, Stepnick said in his letter accompanying the report to Cardwell.

Specifically, improvements were needed in management guidance and emphasis on systems security, security over terminal access and use and effectiveness of programmed security clearance systems, he stated.

Stepnick pointed out that "prompt action" was taken by Cardwell's staff to identify an internal systems control deficiency. Subsequent HEW tests showed corrective action was effective in preventing unnecessary and indiscriminate use of the identification number of one terminal for that of another in addressing the system, Stepnick noted.

In addition, as a result of the HEW audit, the SSA last August established a systems security staff in the Office of Operations Systems and Coordination, the report said.

Mitre Study Provides Wiretapping Lesson

(Continued from Page 1)

known report on wiretapping" written by Mitre Corp. for the White House Office of Telecommunications Policy (OTP), according to the congressman.

An OTP spokesman stated, however, that the document obtained by Moss is not the third volume of the study, but "working papers" given to OTP by Mitre. All the information contained in the "third volume" is "commonly available information," he said.

OTP thought it best to lock up the "working papers" to prevent their aiding a potential wiretapper who would have in one document all the information needed to intercept communications, he said.

The report gives step-by-step directions for the would-be tapper, including how to rent property through which lines to be tapped pass, how to dig up cables and how to attach a gas pressurization bypass to avoid detection.

It also enumerates items that might be used for monitoring, such as head phones, modems, a microprocessor, standard oscilloscopes, tape recorder and printers.

The study was originally undertaken as part of OTP's review of the current federal wiretap laws, according to the spokesman. The agency wanted to understand the flaws and strengths of current communications facilities in order to make recommendations on how to strengthen those laws, he said.

Never intended for wide distribution the study is now being edited and reprinted along with the wiretap laws for release to the public as a result of the publicity the report has received, the spokesman noted.

Awarded to Mitre, possibly on a sole-source basis, on June 15, 1976 for $47,034, the contract for the report resulted in a two-volume document called "Study of Vulnerability of Electronic Communication Systems to Electronic Interception." Those volumes are dated January 1977.

Also dated the first month of this year, the document Moss has is entitled "Selected Examples of Possible Approaches to Electronic Communications Interception Operations" and "deals solely with surreptitious methods of wiretapping," the congressman said in a letter to the Comptroller General of the General Accounting Office (GAO) that asked for an investigation into the study's purpose.

Referring to the third volume, or working papers, of the study, Moss wrote, "Nowhere in this unique document is there any mention of legality, court orders or similar cloaks of authority under which such privacy invasions are grudgingly and occasionally sanctioned.

"In effect, then, this publication, ordered and paid for by federal funds, appears to be a how-to-do-it manual on non court-ordered wiretapping," the congressman concluded.

Moss asked the GAO to determine why such a "how-to" book was ordered by the Ford Administration and why it was needed. In addition, he wondered whether its publication could lead to significant privacy invasions in violation of existing U.S. law.

Further, the congressman wanted to know whether the manual's creation was consistent with congressional appropriations to OTP and whether the third volume was deliberately withheld from distribution and from GAO auditors when they conducted a previous investigation into related issues.

HEW Accuses Manager

(Continued from Page 1)

claimed some of the more than 200 meals in question on his expense account.

The award of the contract for the student loan management system to On-Line Systems — an award made on June 27, 1975 for an initial $1 million that has since increased by $6.5 million — is under investigation by the U.S. Attorney's Office here as well as by the HEW Inspector General, an HEW spokesman said last week.

"The basis for the investigation is gratuities or irregularities concerning the award of the contract," Robert Wilson, a member of the HEW Inspector General's staff, stated. He noted that the investigation is not confined to Parker and that the computer project manager has a right to rebut HEW's charges at a formal hearing.

Parker must challenge the accusation by the beginning of September or lose his job, according to the letter he received from John Ellis, Executive Deputy U.S. Commissioner of Education. Parker, who had no comment on the matter, was reassigned to another post in HEW last May when investigators initially raised questions about the favors he allegedly received, the spokesman said.

HEW officials would say no more about the investigation at this point except that On-Line's performance of the contract is not the real issue.

The *Washington Post* reported that HEW sources indicated the meals in question were purchased by Gilmore S. (Bim) Wheeler, president of an On-Line subsidiary — Business, Industry and Management, Inc.

Neither Wheeler nor On-Line Systems officials were available for comment by press time last week.

'Washed-Out' User Up Again in Two Weeks

By Ann Dooley
CW Staff

JOHNSTOWN, Pa. — Two weeks after its IBM System 3/15D was destroyed and its data modules were soaked by the waters that flooded this town, Crown American Corp. is "up and running."

The real estate company just completed the first payroll on new equipment IBM sent after the old System 3 was destroyed, DP Manager Mike Shutacka said.

"We haven't lost one record, as far as we know," Shutacka said.

Within a few days after the flood, and before the new system was installed, data was being processed on a System 3 owned by Kimball Engineering, Inc. in nearby Evansburg.

"We've had an informal reciprocal agreement with Kimball and were able to work on the night shift," Shutacka said. "We worked on the vendor listings to keep processing the payables.

"Now, we're located in rented space from IBM," he said, "and it's on a hill."

The work will continue there until the company relocates to larger headquarters, something it was planning to do anyway, he said.

Besides damage to the CPU, the worst loss was the accounting records, which were wiped out, he said. But that is pretty much a matter of rerunning whatever it takes in printout time.

"Also, we lost the paperwork, the invoices and things that were in progress at the time of the flood," he said. Those kinds of things will undoubtedly be sent in again, he added.

"We have a daily and weekly backup system and the weekly is kept off-site," he explained. Right now, "we're considering using an off-site daily backup too.

"We're two weeks behind in processing the normal work and it will take another two weeks to catch up, so it will be about a month before operations are running on schedule again," the DP manager predicted.

Shutacka explained that the computer was located in the basement because the Johnstown area was thought to be flood-free. There hadn't been a flood since the '30s, he pointed out.

At one time the equipment was located on the second floor, but was moved to the basement for space reasons, he said.

When the company relocates "we definitely won't be in the basement anymore," Shutacka said. There's still six inches of mud covering the computer, he added.

Although the damage is still being assessed, Shutacka said the cost to the company for the CPU was over $300,000 and estimated an additional $20,000 to $30,000 loss in other equipment and supplies.

Shutacka, who was vacationing in Florida when the flood occurred, returned immediately and began working with the IBM emergency team set up to help in recovery operations.

IBM is "doing an excellent job," Shutacka said. "It's bent over backward to help us out."

The Crown American system handles complete accounting operations for the real estate company and for two Sheraton hotels and two Holiday Inn hotels which the company owns and operates.

Clean-up operations are still under way in Johnstown. "It will be years before the area recovers," Shutacka said. "Entire roads are washed away and the dust is so thick some people wear masks.

"It's hard to believe unless you see it," he added.

Response Strong For Revamp Tips

WASHINGTON, D.C. — A "significant number" of suggestions on how to revamp the procurement and management of DP facilities within the federal government have been received by the Office of Management and Budget (OMB).

Now the office is seeking the names of people who are willing and able to evaluate the ideas and develop whatever recommendations seem appropriate, a spokesman said.

The comments have come largely in response to appeals in a widely circulated letter from Wayne Granquist, associate director of the President's Reorganization Project within OBM [CW, July 11], and in the *Federal Register*.

As soon as they can be categorized, the ideas are being forwarded to project personnel who are drafting "scope-of-work" assignments for task forces to be organized, hopefully, in the late summer or early fall, the spokesman said.

Implementation of the initial recommendations from the task forces should begin within the year.

Contrary to reports published earlier, personnel for the task forces will be drawn largely from outside OMB. The spokesman said the office wants "as diverse a group of individuals" as it can get from government, industry and the academic environment.

Although the "deadline" for suggestions has passed, the spokesman emphasized that ideas are "always welcome. And so are the names of people to serve on the task forces."

Comments and names should be addressed to Kenneth B. Allen, Information Systems Division, OMB, Washington, D.C. 20503.

Computer Associates improves the fabulous

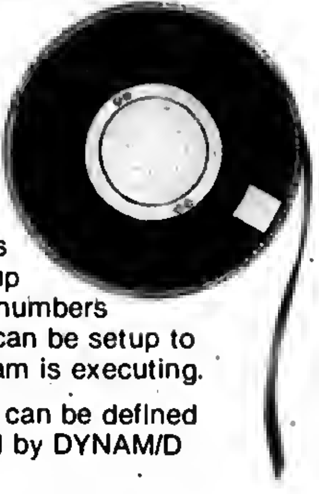
DYNAM/D

The most advanced and complete Disk Space and Catalog Management Software system ever released to IBM users is now ... better than ever!

DYNAM/D made available to DP Managers a software system that solved the most vexing and time consuming design deficiencies of IBM 360/370 DOS and DOS/VS installations.

DYNAM/D brought together all the basic features needed for complete disk management, catalog management and even provided device independence with password file security!

NOW -- DYNAM/D has been enhanced to provide the following new facilities:



- Disk Pool Management allows the user to select from a group or pool of disk volume serial numbers to allocate disk space and it can be setup to relate to the partition a program is executing.
- Protected Disk Volume Areas can be defined so these areas are never used by DYNAM/D to allocate space.
- Backup/Restore of DASD is now provided. Save any disk file onto tape and then restore the file from tape to disk.

And there are many more enhancements to save disk space and improve catalog management. No other software system offers all of those features plus these

- Automatic Disk Space Allocation with full recovery capabilities as the file is opened, not before the job is initiated. And automatic secondary allocation if edditional space is needed.
- True Catalog Management allows control of the physical attributes of the disk file seperately from job control.
- Totel File Security through metching password.
- Device Independence eliminates need for costly program modification when new DASD devices are added
- Complete Utility programs for disk end catalog management as well as disk space usage reporting.

DYNAM/D TAKES JUST 15 MINUTES TO INSTALL ... BENEFITS BEGIN WITH THE FIRST RUN!

DYNAM/D has been tested and proven in user IBM installations world-wide. DYNAM/D is the most complete, most efficient, useful and trouble-free Disk and Catalog Management System in the world. It stends alone for there is nothing else like it.

CREATED AND SUPPORTED BY COMPUTER ASSOCIATES -- ORIGINATORS OF THE NUMBER ONE SORT SOFTWARE, CA-SORT.

DYNAM/D is a development of an international team of dedicated professionals. The continuing research has resulted in the enhancements described -- and more are to be announced later this year.

Little wonder that CA-SORT 77 was the number one sort system on Datapro's "super honor roll", the upper 1% of all systems surveyed. Users acclaimed not only the software system, but the superb and continuing technical support provided by Computer Associates.

TEST DYNAM/D for 15-DAYS FREE!

Send for more details today. Just fill-in and mail the coupon or call us collect. We'll rush a complete Information Kit and details of the FREE 15-day trial. No obligation, of course.

Itel AS Users Find IBM Software Transparent

(Continued from Page 1)

The CPU was the only thing the university replaced. Running under OS/-MVT Release 21.8, the system uses mostly IBM peripherals.

Maple plans to change to an IBM VS/2 operating system soon, but expects no problems; the installation is already operating VS/2 successfully, but not yet for production.

Throughput Up 50%

Scientific Computers, Inc., of Minnetonka, Mich., has had its A/4s for about two weeks and is getting 40% to 50% greater throughput than it did with its IBM 370/145, according to Richard Walter, president.

The company replaced the first of its two 145s with the AS/4. A second AS/4 is scheduled to be installed within the next few weeks.

When the processors were swapped, no changes had to be made to the DOS operating system, Walter said. The switch took about five hours, although the Itel processor was on-site before that and field service people were running diagnostics on it.

The company, with an on-line system serving about 190 terminals installed at customer sites, runs a service bureau operation.

The throughput improvement it is experiencing with the Itel machine is based on switching from a 512Kbyte 145 to a 1M-byte AS/4 "without doing anything to use the other half meg of storage," Walter said. The throughput is "pretty much what the [AS/4] looked like on paper," he added.

Cost comparisons between the IBM and Itel system are difficult to make because the Model 145 was a purchased machine while the Itel system is leased, he noted.

Faced with upgrading its 145s, Scientific Computers made a study and found the "best bang for the buck" was with the AS/4 because it is a faster machine, he said. It sold both of its 145s to make room for the AS/4s.

Information Sciences, Inc. (ISI) of Providence, R.I. brought its AS/4 up in about a day and a half with few problems, according to William Renfrew, senior vice-president.

Job accounting shows the AS/4 is 2.5 to 2.8 times faster in CPU cycles than the 370/145 it replaced, Renfrew said.

"Everything we're running runs exactly the same on the AS/4 as it did on the 145," he said. There were no changes of any type to any program and the DOS operating system is definitely transparent to the Itel system, he explained.

ISI also runs a second 145 it acquired under a long-term lease from IBM. This system has been running for about three and a half years, but a comparison of the IBM cost then with the Itel cost now shows a savings of several hundred thousand dollars, Renfrew said.

The company is now running under DOS/VS and an upgrade to VM/370 is planned. So far there have been no software problems with the Itel system and the operating system upgrade will proceed as originally planned, he said.

ISI is a DP service bureau for Industrial National Corp.

'Without a Ripple'

Ken Pollock, technical director at the Cooperative Computer Center that serves as a regional computing installation for three Illinois state schools running six remote job entry systems from four different vendors, had a similar story to tell.

The center's 2-byte AS/4 was installed only a week ago. Pollock said the conversion went "without a ripple."

The system was rolled in on a truck Sunday morning to replace the center's 1M-byte IBM 370/145.

Tuesday afternoon the operating system was loaded for 12 hours of benchmarking, and at midnight "we were satisfied."

At that time "we cabled across our disks to excercise our software and after one and a half hours we started production and have been running continually since," Pollock said.

Here, too the CPU was the only element of the system to be replaced.

The AS/4 runs IBM's VS/1 Release 6 operating system.

Pollock, who actually works for Systems and Computer Technology Corp., a facilities management firm that operates the center for the state, said going to Itel involved a certain element of risk. But after seeing the benchmarks, it was a simple decision to make, he said.

DP manager Clarence Millfap, who switched from IBM to Itel in 1969, has great faith in the firm as a result of their eight-year relationship; when it began marketing the AS line, he was confident the system would be a good one, he said.

Millfap's firm, Equitable Life Insurance Co. in Des Moines, Iowa, took delivery on a 1M-byte AS/4 on June 20 and was into production with it by June 24.

Equitable's conversion was somewhat different than the usual since "the 4" was brought in — instead of a 370/148 — to replace a three-channel IBM 360/50 with 512K main memory.

But "the cross-over was so smooth it scares you a little bit," he said.

Millfap is very happy with the AS/4's performance — even under IBM's archaic DOS Release 27.1. CPU processing time is twice as fast as the Company's previous 360/50, he said and jobs that used to take four hours now take about two.

"That's not to say that a job can't get bogged down in printing," he added.

By October or November, the insurance company plans to convert to DOS/VS Release 33. Millfap expects that conversion to take only about 28 hours.

Proposal Book Scores Again!

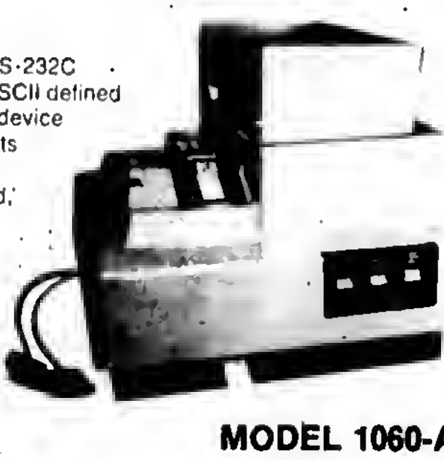
The spectacular rise in sales of *How to Create a Winning Proposal* has scored another net gain this quarter for Mercury Communications, Inc. shareholders. A timely and innovative "how to," *Winning Proposal* has racked-up a stunning track-record since its publication early last year—with the largest volume of sales coming from the aerospace/defense and computer/EDP industries.

Written by two highly-qualified proposal consultants, the book is rapidly becoming the standard text for use in government, commercial, OEM and service company proposal efforts. It is currently being used in GSA, NASA, DOD, HEW, ERDA and other government/military agencies as an aid in proposal evaluation.

Using a step-by-step instructional technique, the authors provide a virtual roadmap to the entire proposal process . . . including technical, cost and management section checklists to ensure the proposal team of covering all the important bases. Excellent guidelines are given on contents, structure and methods of preparation for both solicited and unsolicited proposals.

A tactical approach is used for developing an effective "win strategy," mobilizing the proposal team and controlling the input of the various team members. Detailed instructions on how to analyze and respond to RFP's, RFQ's and IFB's are also included.

Copies are available pre-paid only from Mercury Communications, Inc. 730-CW Mission, Santa Cruz, CA 95060. $55 includes 3-5 day delivery inside USA. In Calif. add $3.12 tax.



ROYTRON™
plug-compatible punch

Desktop punch with serial asynchronous RS-232C compatible interface. Designed to utilize ASCII defined control codes and operate with a terminal device on the same serial data lines. Punch accepts data at all standard baud rates up to 600 baud continuous or 4800 baud batched, utilizing a 32 character buffer

Two modes of operation are provided. *Auto Mode* — Simulates Model ASR 33 Teletype punch using ASCII defined data codes (DC 2 and DC 4) to activate/deactivate the punch; *Manual Mode* — Code transparent mode. Panel switches control activation/deactivation of punch and associated terminal device

MODEL 1060-AS
High-speed, compact, with self-contained electronics and power supply. Complete in attractive noise dampening housing.

Programmer Gains Too Low

(Continued from Page 1)

the possibility of transferring information across the network because this also transfers technological skills.

If the transference occurs across national boundaries, one can envision the emergence of an information segment in all national economies, even in the small ones, he said.

The potentially positive effect of information transfer on economic progress is widely recognized, Tanaka noted, but problems also come with it — problems relating to safeguarding the ethical and legal interests of individuals and organizations while storing and transmitting information.

"Personal as well as nonpersonal information is already flowing across many international boundaries with few controls or restraints and little accountability," he noted.

And while many businesses and services have improved as a result of this information exchange, these activities are not yet covered by any international law, convention or agreement.

Many nations have begun to enact privacy legislation, but each takes differing forms and levels of definition. "The effect of piecemeal legislation, even when implemented in a completely open spirit of cooperation, is to restrict the flow of data to the lowest level," Tanaka said.

Those areas with strong safeguards will be unable or unwilling to transmit information to areas with less data protection, he added.

"In competitive situations, the rules for handling data may be used as excuses for lack of cooperation. Consequently, even as safeguards are being defined and implemented, hopefully on a uniform international basis, there must be assurance that data flow and international commerce will not be unduly inhibited," he said.

Developing Nations

One cannot discuss the transfer of information or technology without mentioning the developing countries, Tanaka said.

While many people believe computers are essential to the development of a country, it is difficult to know how valid that premise may be.

"Not only is it not evident that computers can assist, they may in fact represent a diversion and a waste of economic resources unless they are realistically and carefully used," he cautioned.

Also Plan DP Ethics Code Inquiry

House Republicans Revive Privacy Task Force

By Nancy French
CW Staff

WASHINGTON, D.C. — Republican members of the House of Representatives have resurrected their task force on privacy to study some of the issues left untouched by the Privacy Protection Study Commission.

Under the leadership of Barry Goldwater Jr. (R-Calif.), the task force will hold hearings and study the problems posed by electronic mail, electronic funds transfer, wire tapping, mail covers and Interpol.

The task force will also reopen its inquiry into whether DP professionals should adhere to a code of ethics and standards of conduct such as those observed in the accounting community.

Before the task force was disbanded in 1974, it recommended that DPers do need such a code, a spokesman indicated.

Along with accountants, DPers share responsibility for the business activities of a company and, in some ways, have greater control, he noted, for it is they who control the impact and use of technology.

Another area the task force will be concerned with is Congress itself.

Congress, which includes the Library of Congress, the Government Printing Office, the Copyright Office, the Office of Technology Assessment, the Budget Office and several others besides the House and Senate, is an enormous organization, the spokesman pointed out. The Library of Congress alone, excluding the Congressional Research Service, employs 5,000 people.

A number of apparent privacy violations reported by congressional employees to Republican members of the House have raised their concern about congressional record-handling practices.

For example, a number of library employees complained they have been required to sign annual performance evaluations that were blank; once signed, these documents were kept from them.

The task force will attempt to prepare a description of the existing practices, including the philosophical arguments for and against any specific procedures. In addition, it will examine the risks of privacy legislation for the private sector that will hit upon costs, as well as the possible outcome of increased bureaucratic regulation that may result.

Task force members include Charles Whalen (Ohio), Robert Lagomarsino (Calif.), Micky Edwards (Okla.), Philip Crane (Ill.), Margaret Heckler (Mass.), John Rousselot (Calif.), Jack Kemp (N.Y.), Dan Quayle (Ind.), Frank Horton (N.Y.) and John Cunningham (Wash.).

Swedes Decry Lack of Privacy, Blame It on DP

STOCKHOLM, Sweden — Next to unemployment and inflation, the protection of privacy is one of the most vital issues facing the community, according to a public opinion survey conducted by the National Central Bureau of Statistics here.

Nearly one-third of some 1,000 persons interviewed declared there is less privacy today than five years ago, and one in three of this segment blamed this on computers, data registers and the like.

Fifty-four percent of the total believe the situation is largely unchanged, while 6% detected an improvement. The better educated were more pessimistic than the rest, the bureau said.

About 10% of those surveyed claimed to have experienced some form of intrusion into their private lives over the past five years, a third of them linking the occurrence with advertising or marketing activities. One in five cited public opinion surveys or the actions of the authorities.

Four out of five of those interviewed think computers allow the authorities to give better service to the community, while two-thirds wholly or partly hold the view that more data is accumulated in computers than is really necessary.

Forms Due For CCP Exam

CHICAGO — Registration forms for the Certificate of Computer Programming (CCP) exam must be in by Aug. 31, according to the Institute for Certification of Computer Professionals (ICCP), sponsor of the exams.

On Oct. 22, the test date, three different examinations will be offered — oriented toward business, scientific and systems programming.

The top 50% of the senior-level programmers practicing today should be able to pass the exams, according to the ICCP.

The fee is $75. Study guides and other details about the CCP as well as the Certificate in Data Processing examinations can be obtained from the ICCP's office at 304 E. 45th St., New York, N.Y. 10017.

Only Perkin-Elmer Terminals give you power front forms insertion.

Take any multipart business form — bottom glued or unglued — drop it into our front forms insertion device. At the touch of a button, your form will feed automatically. That's it. DP Helps States, Utilities Monitor Air Quality

By John P. Hebert
CW Staff

SAN DIEGO, Calif. — Data communications and computer technologies have been instrumental in helping some state power companies and environmental protection agencies (EPAs) monitor the air quality in their cities and towns.

And for the power companies the application of DP is helping avoid fines of $10,000/day by making sure the companies don't introduce more than a specified amount of pollutants into the air at any given time.

Stagnant air is the power companies' worst enemy. When winds die power companies must use low-sulfur fuels, which cost $1.25/barrel more than those high in sulfur that can be used in clear weather.

Because a utility can burn 10,000 barrels of fuel each day to generate electricity, it is advantageous to shift from one fuel to the other, depending on the weather.

The power companies have either procured their own computer and communications systems or hired DP. experts from consulting firms as a matter of self-protection, according to Al Budd, marketing vice-president at Monitor Labs, Inc. here.

In fact, because federal and state legislation is in favor of the consumer, in this regard, air pollution monitoring and data gathering has become a $100 million annual business, according to Budd, whose company developed and sells an on-line air quality data monitoring (Adam) system to utilities and state EPAs alike.

Station Configuration

The Adam system's central station consists of a Data General Corp. Nova minicomputer with from 16K to 32K of main memory, a Teletype Corp. ASR 33 teletypewriter, an 800 bit/in. DG or Kennedy Co. magnetic tape transport and a Centronics Data Computer Corp. 101H line printer, Budd said.

It also includes a Remex Corp. Model 6375 paper-tape punch and a "low-cost" CRT such as a Beehive Medical Electronics Corp. or Lear Siegler, Inc. console, he added.

Telephone lines are also a necessity for Adam, as are modems to interface the ML-7000 central station with data loggers and up to 20 remote air-monitoring stations, each with a dozen or more chemical and weather sensors in the field, Budd said.

The systems are currently being used by EPAs in states including California, Massachusetts, Washington and Wisconsin and by power-generating companies such as Georgia Power, Geomet in Maryland and Gulf Power in Florida.

"The old way of measuring air pollution is no longer acceptable," Budd said.

"Until recently, the various analyzers were placed in a remote shelter and data was recorded on strip chart recorders or magnetic tape.

"Periodically, someone would pick up the tapes. If a sensor or recorder stopped operating, it might be hours before the malfunction was discovered. Also, there was no possibility of on-line control in case of an emergency," Budd said.

Continuous Monitoring

In the Adam on-line telemetry system, all of the data is being monitored and validated continuously. Calibration of each sensor can be initiated from the central station by one person keeping tabs on every sensor in the network and measuring as many as 100 parameters.

If data from a sensor or a remote data logger shows excessive errors, the operator can take immediate corrective action.

Quick correction action is necessary because in order to clean the air the state-controlled EPAs require power companies and refineries to prove that the pollutants being emitted are not adversely affecting the atmosphere.

Adam consists of a network of Monitor Labs data loggers - one at each remote station — connected to the minicomputer through leased or dial-up lines using Vadic VA305 G or VA305C 300 bit/sec modems respectively, and Vadic VA801AC pulse dialers.

Each remote data logger digitizes and formats the data from the sensors at its station before transmitting to the Adam central station, where the necessary conversions are performed on a real-time basis.

"We use Vadic modems in our Adam system because they're cost-effective and reliable. We can buy them cheaper than we can build our own. We've designed them into the system," Budd explained.

"Probably the most important feature is Vadic's local and remote loopback capability. We have implemented these test features into our hardware and software so we can quickly check out the complete network," he continued.

"Using our software and Vadic's diagnostics and displays, it's simple to identify a problem and localize it to the phone line, the modem or our hardware," Budd said.

A system check is initiated if the operator at the central site detects excessive errors from a particular remote station.

First the modem at the computer site is tested. Under Adam software control, the modem is put into local test, where the modem transmitter and receiver are set to the same frequency and the transmitter output is connected to the receiver input.

In this mode, data is looped from the computer through the modem and back. This usually consists of typing information on the console keyboard and checking its validity. The test checks out the local modem and data terminal.

If the local modem checks out, a remote (echo) test is made. Under software control, the specified remote station is selected, all other stations on the line are blinded and the remote modem is put into the remote test mode.

Remote test disconnects the modem from the data logger and connects the modem receiver output to the transmitter input. Data now received by the modem's receiver will be retransmitted to the central computer.

This test verifies both the remote modem and the communications channel. If both the local and remote tests prove valid, the problem is isolated to the remote data logger or one of the sensors. A technician can then be dispatched to the scene for repair or replacement.

The modem's diagnostics can be taken another step in case the local and remote loopback test initiated at the computer site are not conclusive. For example, if the local modem test checks out, but the remote test doesn't, it could be the telephone line or the modem at the data logger.

When this type of ambiguity exists, a technician is dispatched to the remote location and the local and remote tests are done at that end.

If the remote modem is found to be operating using the local test mode and the central computer modem has already been verified, the problem must be in the telephone line. At that point the phone company can be called in.

White House Fellowships Available for Next Year

WASHINGTON, D.C. — If you're a proven leader who is intellectual, highly motivated and have a commitment to community and nation, you might qualify for one of 14 to 19 White House Fellowships for 1978.

Established in 1964 by President Lyndon B. Johnson, the nonpartisan program was designed to give outstanding, rising young leaders one year of first-hand high-level employment in the federal government as well as a comprehensive educational seminar.

In addition to their job assignments as special assistants to the Vice-President, Cabinet Secretaries and principal members of the White House staff, the Fellows participate in an extensive seminar program consisting of off-the-record sessions with top government and private-sector leaders, journalists, scholars and foreign officials.

The program is open to U.S. citizens as long as they are not employees of the federal government (with the exception of regular members of the armed services). There is no occupational restriction.

Those selected in past years have included scholars, engineers, corporate employees, academic professors and administrators, medical doctors, architects, local public officials, lawyers, oceanographers, a policeman and a symphony conductor.

Application materials and additional information can be obtained by sending a post card to The President's Commission on White House Fellowships, Washington, D.C. 20415.

Requests for applications must be postmarked no later than Nov. 15.

DP-Aided Program Funded By State.

Handicapped Kids Learn at Home Via Cable TV

By Molly Upton
CW Staff

AMHERST, N.Y. — Handicapped children unable to attend school on a regular basis are receiving instruction at home on television screens through a program here now being financed by state funds.

Originally a two-year pilot program financed by an $817,000 grant from the Department of Health, Education and Welfare's bureau of education for the handicapped, the project this year will be expanded to tutor about 500 students, according to Jim Morilla, an associate in the state's Department of Education, Bureau of Program Development.

Previously available only to about 100 students in Amherst, the instructional program will be expanded to reach students' homes and some schools in Buffalo, Tonawanda and Kenmore as well, he said.

The same system is being used at the Human Resources School for the physically handicapped in Alberton, Long Island, for physically handicapped on a closed-circuit basis but will soon be available to homes there, too.

The cost of replicating the system is under $200,000, as original development is now completed, he said. Unit costs will decrease even further when new video transmission techniques currently being developed increase by ninefold the number of students who can use a given channel on the cable TV system, he added.

In the pilot project, the $150 cost of the keyboard/coupler was underwritten by the grant. Morilla's biggest problem is finding the financing so that families don't have to pay for the units. He is attempting to form a consortium to obtain funds or else arrange some sort of charge-back scheme to school districts.

The program provides instruction to children who are physically handicapped, emotionally disturbed and neurologically impaired as well as chronically ill and hospitalized.

Interaction Via Keyboard

A student dials the central computer, places the phone in a special acoustic coupler and interacts with the system via a keyboard attached to the telephone. Requested material is delivered by the International Cable CATV system to the students' TV.

The system is called Tel-Catch (Televised Educational Lessons via Computer-Assisted Instruction at Home over Cablevision to Children wiht Severe Handicapping Conditions).

It was developed by the Mitre Corp. as part of its Time-Shared; Interactive, Computer-Controlled Information Television project (Ticcit).

"Technology has traditionally bypassed the handicapped in the educational field primarily because of the low frequency of handicapping conditions and the high unit production costs," according to Marillo.

"But Tel-Catch, by aggregating enough students to make unit costs lower, is proving that technology is a feasible solution to the special educational problems of the handicapped," he observed.

At the heart of the system is a Hewlett-Packard Co. 2000F system which has access to three major files of curriculum materials. The first contains eight separate courses ranging from third grade to high school equivalency level.

A second set offers about 350 lessons on a wide range of subjects for grades one through nine, and the third includes a set of simulations and games available in the HP-contributed program library.

Many of the programs were developed by educational researchers at Stanford University and the Palo Alto, Calif. Unified School Disrict.

The 2000F, which is linked to an HP 2100S with 64K bytes and an HP 2100A with 16K bytes, as well as HP disk and tape units, retains a scholastic file on each student and tailors an academic menu to his speciific needs, according to Tel-Catch developers.

Teacher's Function

After the student indicates what type of course he wants to study, the computer will locate the last question completed by that student. But the system doesn't rely completely on machines.

A student can punch a key on the keyboard asking for personal assistance. Two special education teachers are available to respond to individual requests.

The Tel-Catch project also includes material for the childrens' parents.

Tel-Catch student learns how to access her individual file, maintained on a high-speed minicomputer.

$59 a month.

Petty cash.

You can lease the new Hazeltine 1500 from Marketing Dynamics for less than $2.75 a day — which is probably less than you spend for a quick lunch.

The Hazeltine 1500 is a true state-of-the-art terminal with *standard* features that read like the other guys' extra-cost options.

STANDARD FEATURES

☐ Separate numeric keypad.
☐ Switch-selectable upper/lower case.
☐ Cursor addressability.
☐ Line insert/delete.
☐ Switch reversible video.
☐ Full 24 × 80 display.
☐ 12-inch screen.
☐ High-legibility 7 × 10 dot matrix.
☐ Automatic repeat on all keys.
☐ Locally available maintenance.
☐ Fully warranted by Hazeltine.

Hazeltine 1500

Excellent dealer opportunities available.
Write or call for more information.

Mayoral Candidate Attacks DP Voting

GREENSBORO, N.C. — Claiming that adopting computerized voting is the same as encouraging vote fraud, mayoral candidate Marion Porter has accused the Guilford County Board of Commissioners of "selling the integrity" of votes in the county by switching to a computerized system.

The Computer Election Systems (CES) voting system will be used for the first time in Guilford County's election this fall, the one in which Porter will be running for mayor of Greensboro.

Porter claimed elections are difficult to "fraudproof" and computerizing elections make them even more so.

The computer programs are very dangerous, she said. Someone could rig the program to winnow out a certain percent of a candidate's votes and no one would ever notice, she charged.

"All sorts of scary kinds of vote fraud could be used to hit particular candidates," Porter said.

Computer systems are not error proof either, the U.S. Labor Party candidate charged. An error could occur and not be discovered until after the election and perhaps never, she said.

The Labor Party wants a uniform ballot in order to avoid misuse of the system, she said. One way would be to require all voters to sign their names at the polls.

With a computerized system, the only way of assuring honesty is to have a completely independent programmer check each candidate's returns, she stated. However, such a method is impractical and wouldn't even guarantee a fraudproof system, she said.

Program Predicts Recovery Paths Of Open-Heart Surgery Patients

YORKTOWN HEIGHTS, N.Y. — In the critical hours following open-heart surgery, one of the most important questions doctors must face is whether the patient's recovery is likely to be easy or difficult. Survival often depends on an early and reliable answer to this question.

An experimental computer program capable of predicting a patient's recovery pattern — even before surgery — has been jointly developed by scientists at IBM's Thomas J. Watson Research Center here and physicians at the State University of New York at Buffalo and Buffalo General Hospital.

The program is an outgrowth of an earlier effort by the two research groups to develop a computerized procedure for characterizing the types of patient recovery patterns.

While the experimental program has not yet been used during the actual hospitalization of a patient, this goal has a "very high priority" and the earlier recovery-pattern characterization program is already being used on a regular basis, according to Dr. John H. Siegel, chief of surgery at the Buffalo hospital and head of the research team.

Patients Analyzed

In order to use mathematical techniques to predict the recovery path of a patient, IBM researchers analyzed all the data gathered during the recovery periods of 32 patients. They also studied the diagnoses physicians had made at the time the patients were in the hospital. In the end, they had a program that matched the physicians' classifications of the patients' recovery patterns.

Then the computer program was put to the test with data from 54 other patients. The machine was asked to predict a recovery pattern with only one or two days of data.

The computer program predicted the recovery patterns of all the test patients based on data collected immediately after surgery with a reliability of 72%. When the computer was given all the data collected for two days following the operation reliability rose to 88%, researchers found.

Highest-Risk Cases

The program proved to be 65% reliable in predicting the likely recovery patterns of the highest-risk patients with only the data collected just before an operation. Thus, if a patient seems likely to have a very difficult, even fatal recovery period, a decision could be made not to do the operation at all. Or, if the operation is absolutely necessary the operation can be monitored more closely than usual.

The recovery prediction program is based on a set of 11 medical measurements collected from the patient through a catheterization procedure. During the recovery period several sets of the measurements may be collected in order to chart the progress of the patient.

Four of the measurements have to do with heart function, four others tell something about the condition of the blood vessels and body chemistry and the remaining three measurements concern lungs function.

Basic Patterns

Patients recovering from open-heart surgery generally fall into one of three basic patterns.

The Type 1 patient will show a rapid recovery with a minimum need for drugs to support the heart and lung functions.

Type 2 patients, on the other hand, will need heavy drug support, although they can be expected to recover satisfactorily.

Type 3 patients require the most extensive drug support and even then the prospect for recovery is marginal.

Without a computer, physicians can not classify a patient's recovery type before surgery and may take up to three days after surgery to correctly classify all the highest-risk patients.

In addition to improving the recovery outlook from open-heart surgery, Siegel sees the computer program as a possible step toward lowering the cost of medical care by reducing the time spent by the patient in the hospital.

Savings Cited

"If we can reduce the long-term stay of patients both in the intensive-care unit and the hospital itself, the saving there will more than outweigh the cost of doing one of these computer analyses," he said.

In the case of a heart patient who does well, the normal stay in the intensive care unit is two days. A patient experiencing a difficult recovery might spend a week, or longer, in intensive care.

"Of course, if you can save somebody's life, that's an incalculable value," Siegel added.

The program was funded in part by grants from the National Institutes of Health.

PROFESSIONAL
MAINTENANCE SERVICES

Zeeneh's staff of highty qualified Field Engineers provides country wide installation and maintenance services for computers and sophisticated electronics under either their own or the agent's name.

You no longer need to make those expensive trips, over staff for your workload, undertake extensive training programs, etc. Since we currently maintain a number of different product lines and have many years of IBM training/experience, we can doubtlessly save you the considerable investment normally associated with the establishment and operation of an overseas service organization.

Our services have proven to be equally attractive to suppliers just entering the Iranian market and to those who have recognized the difficulties of maintaining a technical staff in this environment.

COMPUTERWORLD
THE NEWSWEEKLY FOR THE COMPUTER COMMUNITY

To Update Price Changes

Commodity Observers Test Voice Data Entry

By Molly Upton
CW Staff

CHICAGO — A small group of market observers at the Chicago Mercantile Exchange is using voice data entry to update price changes on the commodity exchange here.

Voice data entry and hand-held keypads are two alternatives being considered to replace the 17 space-consuming terminals currently on the trading floor, according to Glenn Windstrup, manager of information services.

Three voice data-entry units from Threshold Technology, Inc. have been on-line on the floor since April as part of a pilot project.

As observers notice price changes, they utter them into their wireless microphones. The data is transmitted to a device based on Threshold's 500 microcomputer which is linked with a Data General Corp. Nova, he said.

The information is then transmitted from the Nova to the exchange's IBM 1130, which prepares the data for the ticker and a display board, Windstrup indicated.

The floor of the commodity exchange is an "open-outcry market," with traders shouting price changes.

The three persons using the voice entry units are assigned to watch those commodity markets with a lower volume of trading, he said.

For the other commodities, observers write the quotes on three-by-five cards which are then relayed to one of the 17 terminals on the floor for input.

It is too soon for a verdict on the system, Windstrup said, adding "we're very much in a test mode and it would be premature to give an evaluation." Threshold provided the software for the system.

As for the wireless hand-held keypad alternative, the exchange is still negotiating for a test system.

And, although the exchange is looking for alternatives, Windstrup said it would be "premature to say the exchange will consider switching, since there's nothing definitive that says the methods are better than the current ones."

Taxpayers' Suit in Trouble

By John P. Hebert
CW Staff

CONCORD, Calif.— Taxpayers contesting the acquisition of an IBM computer system by school district officials here may have lost their bid to have it returned to IBM.

Judge Richard Calhoun handed down a "memorandum of intended decision" last week in the Superior Court of Contra Costa County that disagreed with each point of law on which the taxpayers based their case against the Mt. Diablo Unified School District [CW, April 25].

Although the memorandum is not a final judgment, there is little chance Calhoun will change his tentative ruling, according to Stuart Safine, the taxpayers' lawyer.

Smith vs. Mt. Diablo was initially brought in 1974 and has been bounced back and forth between courts since that time [CW, Nov. 22, 1976].

The present superior court case was brought last January and continued until early last April.

Jerry Smith and the other taxpayer-plaintiffs alleged the IBM 370/125 system had been purchased without open competitive bidding and with funds earmarked for school building construction.

They hoped to recover about $650,000 — the cost of the computer, peripheral equipment and maintenance costs from January 1974, when the system was installed, to the present.

Claiming he had presented "consistent evidence" against the school officials, Safine said Calhoun's tentative decision was "overwhelming" and makes no sense at all.

"We had one helluva good case and it looks like something funny is going on here," Safine said, claiming Calhoun had only two working days in which he could have reviewed and digested information in the three final briefs.

The judge "obviously had his mind made up" before reviewing the briefs, Safine charged.

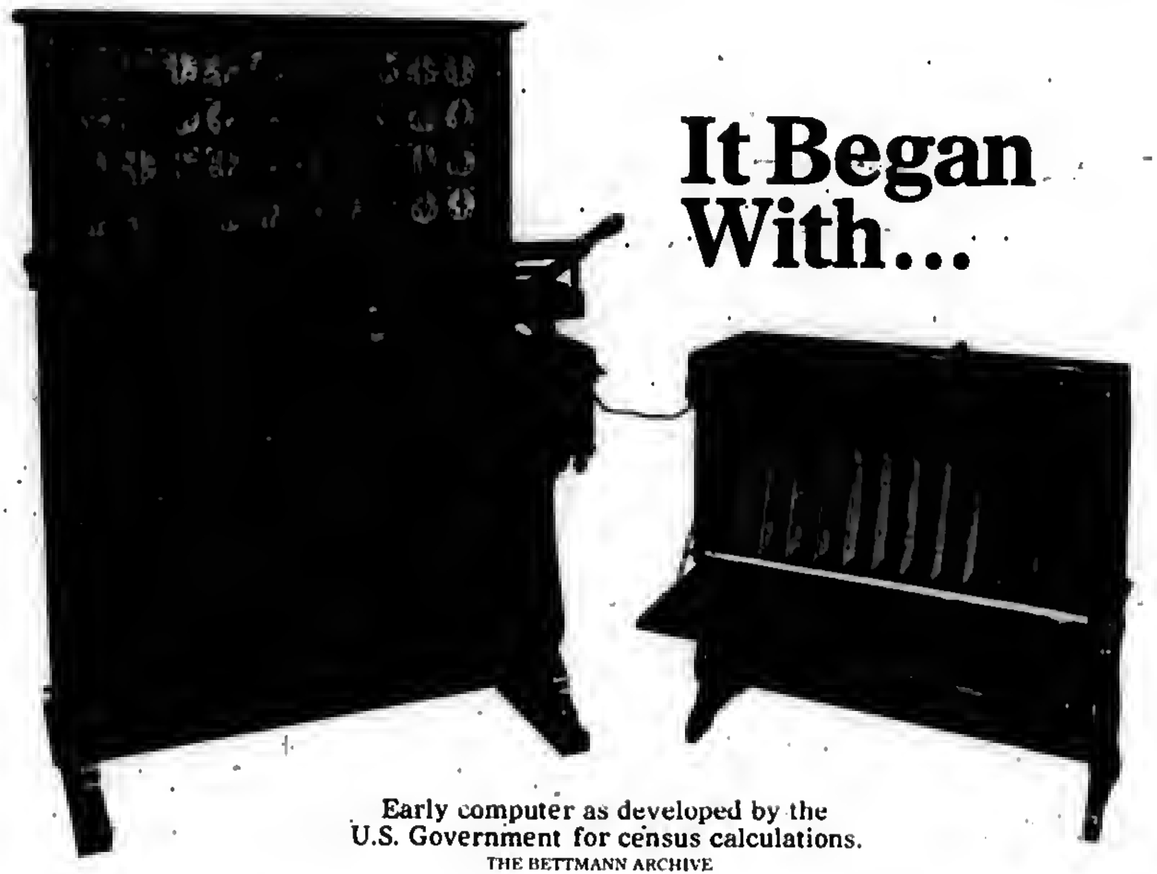
The taxpayers "will definitely appeal the case when a formal judgment is handed down, after they discover the bases for the judge's conclusions," he said.

Curtis Prize Awarded

EAST LANSING, Mich. — Dr. James L. Lubkin of Michigan State University is the 1977 recipient of the John A. Curtis Award for the outstanding paper presented in the Computers in Education Division at the annual conference of the American Society for Engineering Education (ASEE).

Lubkin is a professor of civil engineering and metallurgy, mechanics and materials science. He received the award for his paper "Teaching Professional Use of the Computer While Teaching the Major."

It Began With...



Early computer as developed by the U.S. Government for census calculations.
THE BETTMANN ARCHIVE

And to say that data processing environments have continually changed would be an understatement.

As your environments have changed, your needs for better analysis and control of the more sophisticated systems has continually increased.

We at Value Computing have responded to your needs for more sophisticated analysis and control with a family of integrated system software packages such as:

- **Comput-a-Charge** — a resource utilization and accounting system which provides management with the information necessary to better manage and account for their data center resources.
- **Valu-Lib** — a complete on-line, tape inventory, control and management system for your tape library.
- **Scheduling Systems** — a series of systems which provide the facilities to schedule and control your machine and/or complete data center production environment.
- **EASY SPACE** — a DOS-VS disk management system which improves DOS-VS operations.
- The **PARTITION BALANCER** — a DOS-VS software system which optimizes the scheduling and servicing of DOS-VS jobs.

Integration of these Value Computing software systems is accomplished through an operations data base which is created to satisfy your specific needs.

Valu-Gen, a report writer, has been made available to satisfy the special reporting requirements which appear with more complex operations.

And as your environments have changed, each of these systems has been enhanced to support options you may utilize such as IMS and CICS.

These management tools are assisting hundreds of data processing managements in a variety of DOS/DOS-VS, OS/OS-VS, and VM operating environments.

Of course, we can expect more change. However, the Value Computing software systems can assist you to plan for and control when change will occur. For more information about these systems please call us at **800-257-8242** or send this coupon.

New Heyday Coming?

Not too many years ago, users were assaulted with a variety of plug-compatible peripherals. Each of these disk and tape systems promised lower prices and sometimes improved operations compared with the IBM peripherals they replaced.

Today a similar competitive area is opening up with the IBM-replacement CPU — the "alternative system." The company generally credited with launching the concept of the alternative system is Amdahl Corp., which began with CPUs that offered improved operating parameters while retaining IBM operating system software.

Since then, Itel Corp. has introduced its Advanced System series and Control Data Corp. has unveiled its Omega system. These alternative systems are being sold as functionally equivalent to the IBM mainframes they replace. In addition, the vendors say, the user gets improved processing power at lower cost.

In the case of Itel and CDC, the user has a choice between using IBM peripherals or using plug-compatible systems supplied by the firms. And varied financing plans are available with many of the alternative systems to optimize the accounting goals of the customer. Itel was a pioneer in this area with its innovative packaged leased plans that originated during the plug-compatible peripheral heydays.

IBM has not been standing still while the alternative systems have emerged. It introduced the 3033 and soon will introduce a similar CPU, reportedly slated to be called the 3032, and perhaps another model with it.

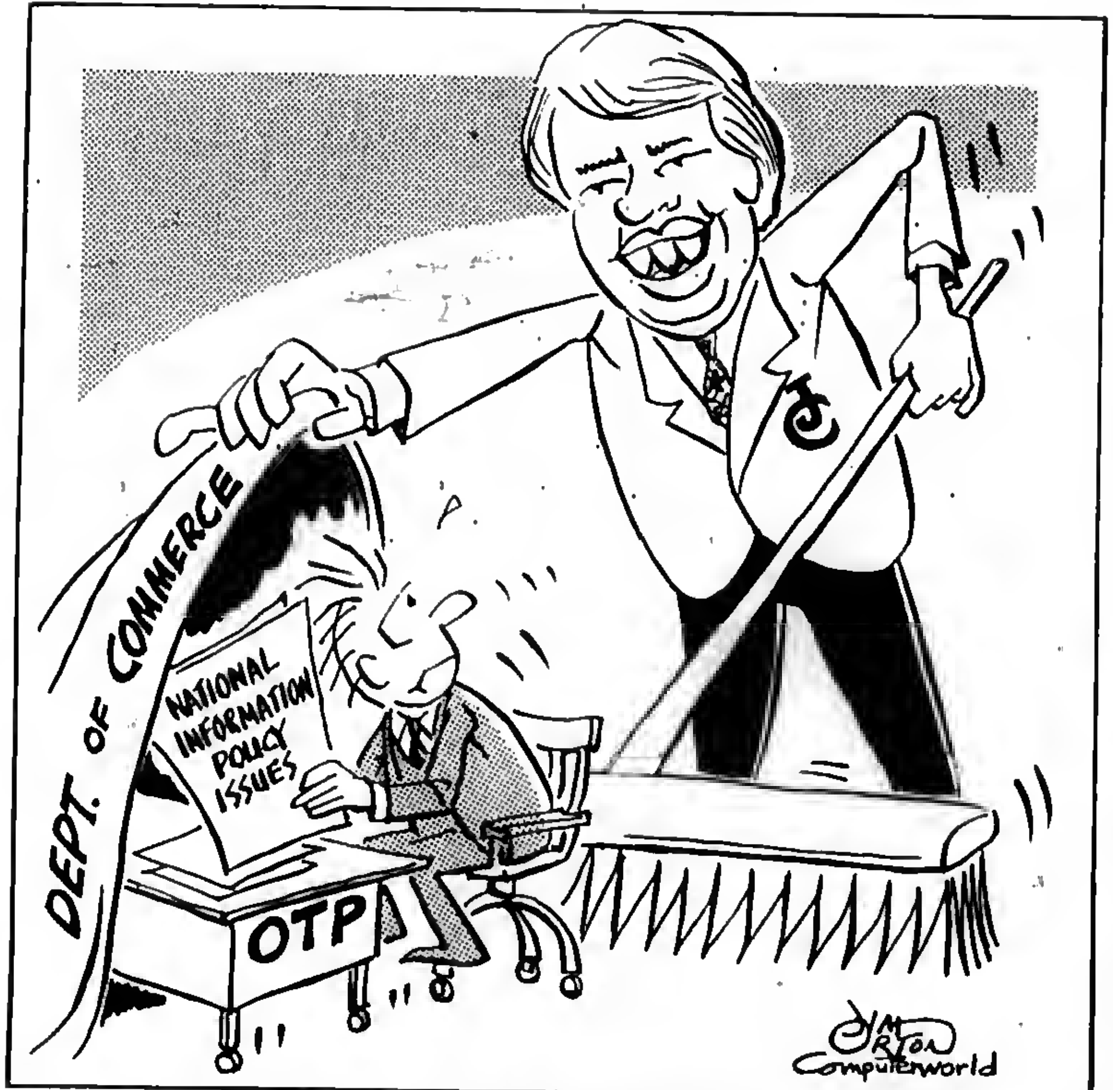
In addition, the industry leader has lowered CPU memory prices and, in some cases, split operating systems between software and microcode modules, thus trying to slow down the alternative system concept.

But early users of the alternative systems are pleased with their operating benefits and the associated financial savings. There is every indication the alternative system area will grow (see series beginning on Page 39).

It is still too early to say whether the alternative systems will become as popular as the plug-compatibles were. There are some differences, especially in size. An alternative CPU or complete system represents a much larger investment for a user than a disk subsystem.

But the competition is growing. IBM is being challenged on its home turf, mainframe for mainframe, with high stakes for the challenges. Users are watching on the sidelines, evaluating and comparing systems to see which best meet their needs.

This is still a dynamic industry, and in its relatively short life one principle has emerged: When alternatives are present, the user benefits. The heyday of the alternative system may be just around the corner.



'What Y'all Need Is a Mite More Sheltered Environment. . .'

Letters to the Editor

IBM 3033 Delivery Schedules Will Stir Marketplace Panic

When IBM announces the delivery schedules on its 3033s, panic will hit the marketplace. IBM plans to produce only 800 systems at 40 systems a month and presently has over 2,100 orders for such systems.

Will IBM expand its manufacturing capabilities to produce more systems? No! Will there be a panic to order Amdahl computers? Yes! What will happen to customers selling their IBM 3033 early deliveries at fantastic premiums? They will never see a machine from IBM.

It is expected that IBM will attempt to calm this panic by announcing the IBM 3032 on or about Sept. 15. These systems will probably reduce the 3033 customers by, at most, 400.

The problem is bewildering. Used computers will be at a premium and it appears the Japanese can take advantage of this situation through massive imports. Don't expect IBM to randomize delivery positions, as it will definitely handfit preferred customers.

George S. McLaughlin Jr.
Summit, N.J.

SSN Misused Once Again?

The July 25 issue of Computer*world* printed an article describing a criminal wanted by the FBI ["Systems Analyst Sought by FBI for Fraud"]. While I feel CW offered a valuable public service in doing so, part of the description irritated me.

Your attempt to track a person down using his Social Security number (SSN) indicated your approval of its use as a general form of identification. I am opposed to this even where it applies to criminals.

Now you know how I feel on the subject of using the SSN as an identifier. Please publish your view.

Steven R. Seltzer
Willow Grove, Pa.

Oops! We goofed. We agree with Seltzer that the SSN should only be used for Social Security purposes. Ed.

Footnote on IBM in Nigeria

I would like to add a footnote to the letter written by Nate A. Newkirk illuminating the generosity of IBM in Ibadan, Nigeria [CW, July 11].

At that time, 1962, IBM had no installation in Nigeria, that market being shared by ICL, NCR & Burroughs. There may indeed have been only the benefit of Nigerian nationals in mind when this computer center and several scholarships were donated, but at that time, as a competitor, I did not so view the IBM action.

I would then have agreed that "15 years later IBM's investment continues to provide benefits in keeping with Watson's and IBM's original intent."

Norman J. Parkinson
North Bend, Wash.

Lord Challenge 'Asinine'

Kenniston Lord Jr.'s "challenge" to Joseph Rigo [CW, July 25] was both asinine and ludicrous.

Asinine, because he feels that merely taking an exam will change somebody's feeling about it. That is sort of like drafting somebody into the armed forces and expecting him to change from a dove into a hawk.

Ludicrous, because he thinks that people and their ideas can be bought, regardless of their founding. They pay draftees, don't they?

Andrew R. Farber
New York, N.Y.

Data Past

Five Years Ago
August 9, 1972

WHITE PLAINS, N.Y. — IBM said its System 370/135s and 145s would be upgraded to include virtual storage capabilities at no charge. At the same time, the company announced the 370/158 and 168.

The firm also announced virtual storage packages for the 370/155 and 165, but those were available only for purchased systems and cost $200,000 for the 155 and $400,000 for the 165.

— — —

WHITE PLAINS, N.Y.— The first of IBM's four system control programs, OS/VS1, was used by the company to demonstrate the capabilities of the expanded line of 370 CPUs. Each of the control programs was compatible with the existing version of DOS or OS to avoid the conversion complications that accompanied switches from one operating system to another in the past.

Eight Years Ago
August 13, 1969

NCR Corp. admitted there were problems with software designed for its Century 100, but said they were being solved. One user said, for example, that the Central Information File, a software package for banks, really required a Century 200.

— — —

NEW YORK — PL/I continued its slow march toward standardization at a meeting of the Composite Languages Development Corp. The group, a division of the U.S. Standards Institute's X-3 Committee on Computers and Information Processing, was formed to further develop the PL/I language in collaboration with Technical Committee 2 of the International Federation for Information Processing and Technical Committee 10 of the European Computer Manufacturers Association.

DPers 'Disconnected' From Family Life?

By Jack Stone
Special to CW

As I continue to report on what, I hope, are new and interesting facets of the connection between humans and computers, I have steadfastly refrained from carrying the discussion to the rather sacrosanct quarter of personal lives.

However, I decided to make an exception for this column after having received a very thoughtful and provocative letter from the wife of a computer person. It is printed below.

This letter captures in a concise and literate way the feelings expressed to me by a number of my friends who are emotionally entangled with computer people — both with and without matrimonial status. The computer people are accused, without regard to gender, of being variously insensitive, withdrawn, callous, hard-hearted, unfeeling, introverted, inhuman, soulless, dull, unsympathetic and apathetic.

Are computer people, as a group, any more or less humanistic than any other group of professional people in America? Surely all of us have heard charges of heartlessness levied at every major professional group during recent years including doctors, lawyers, politicians, engineers, scientists and professors. Are these people properly "connected" to high standards of humanistic conduct?

Do computer people generally develop into successful family partners? I think we have all seen good and bad marriages involving computer professionals. In my own experience, I don't believe the percentages are much different from those of the other professions. I must say, though, the marriages of my highly technical friends seem to be working out better than those of my computer systems marketing friends.

Are computer people generally "insensitive" and "unfeeling" toward other people?

I'm not prepared to say the answer is "yes" or "no," but I can say that computer people are generally preoccupied with their work. I do not conclude that computer persons are insensitive by virtue of their creative abilities, but I do believe that a combination of heavy work loads, exhausting schedules, lack of social opportunities at work and the need for intensive study outside work may tend to give the appearance of insensitivity.

Unfortunately, even the appearance of continuing apathy will force the decay in emotional relationships.

So here's the letter. I suggest you read it first for content and then for style. You may find, as I did, the letter is more of a lyrical poem than a communication to a freelance writer.

The Human Connection

Dear Jack:

One fine day I stumbled upon your column while I was waiting for an interview in a local computer company. "Aha!" I thought. "Can this be true? Is there someone who actually recognizes there just might be an element of dehumanization in this vast, mystical computer world of ours?"

Let met tell you about my "connection" to a computer-type person and the world therein.

I'm the "human." The "connection" was marriage — you know, that state of matrimony designed (programmed) for love, children and happiness. Well it was all of these things, but Oh God, there was loneliness, too — a (computer) world of loneliness.

In the beginning there was love, not a lot of communication, but love, and soon a child, and another — and then THE JOB, a position with a large computer firm. We were moved away from family and friends to an area of computer firm people.

But that was okay then. It was exciting to explore a new place and to discover new friends. It was even a bit comforting to have neighbors who all worked for the same company. You see, we wives would commiserate over our husbands' involvement in their jobs and the apparent indifference they had to their kids, holidays and us.

It was good therapy, that commiserating — for a while. But when I became aware that all of my "special times" — times I wanted to share — were simply "plain ol' times" to him, the loneliness became too large, too sad.

There was a Christmas, for instance, a glowing day of happy children, lovely carols and good friends. I think there was even snow, and I had such nice feelings that I suggested a glass of wine by the fire. He said, "Too late, goodnight." So sad, no quiet time together to share the specialness of the day.

And the trip to San Francisco was another time. We left the kids with a sitter and flew off to this exciting city, stayed in an elegant hotel high on a hill, ate in romantic restaurants, walked along Fisherman's Wharf, through Chinatown, then up and down the streets of that fascinating city.

When we returned home, a friend asked my husband what he thought of San Francisco. He paused a moment — he often paused before he spoke — and I waited . . . (compute . . . Compute . . . COMPUTE . . . PRINTOUT!) — "Nice."

(Continued on Page 16)

IBM Trade Controversy Goes On in Australia

The Taylor Report

By
Alan Taylor
CDP

Firms that trade under initials are sitting ducks for "clever" sayings, and IBM is no exception. Its personnel policies were harpooned some years ago with the suggestion that IBM stood for "I've been moved." The practice of "decommitting" products and descriptions after taking orders was summed up in the phrase "I've been misled." Now, as many people in Canberra, Australia, would tell you, the letters stand for the International Business Methods of the company.

The trouble came up last month when IBM stopped selling most of its products in Australia in protest against the government-sponsored Trade Practices Act, as reported in this column last week.

Since then, matters have not stood still, but the situation is still confused. A new minister of business and consumer affairs has been appointed. The IBM managing director has met with both outgoing and incoming ministers and is reported as saying it appears the IBM contracts will not have to be rewritten (whatever that means).

What is becoming clearer, however, is that what IBM is objecting to is Australia's action to make all firms, large and small, responsible for damages caused by "deceptive" or "misleading" conduct. As its name states, the law deals with trade practices and not trade goods.

The key sections of the act are parts V and VI. Part V outlaws "conduct that is misleading or deceptive or is likely to mislead or deceive." Part VI lets firms recover in the courts for some types of breaches of Part V, provided that all the circumstances (apparently including the proposals given, any advice supplied, etc., as well as the relative knowledge of the two firms) make it reasonable.

Under one of the many "outs" in the legislation, where a supplier draws attention to any defect or advises the customer as to what precautions he should take to check for potential defects, there appears to be no liability at all.

However, liability does exist if, for instance, in a proposal or through some other conduct IBM were to suggest an "unsafe" way of using a product with known deficiencies; or if it overstated the capacity of the system in a deceptive or misleading way.

Now, I can't see anything unreasonable or impossible with that trading standard. If a sort is liable to lose records and not report the loss and if this defect is known to IBM, then I can't see why the Australian law shouldn't hold IBM responsible for deceptive or misleading conduct.

And I certainly can't see why IBM couldn't operate under such a law simply by cleaning up its sales practices, where necessary, in that country.

What IBM seems to want to do is to limit any potential damage award to some multiple of the price of the deceptively presented product.

At current prices, this limited amount would be trivial in any software case. And, because of the industry box-by-box pricing structure, it would probably also be trivial in the case of misrepresented hardware.

For instance, if IBM failed to point out the inadequate checking of tape reading, a multimillion-dollar data base could be destroyed, yet the damages would be limited to the multiplied price of the single tape drive concerned.

Certainly the adoption of this type of limitation would enable IBM to balance its books on an installation-by-installation basis. But it would not satisfy Australia's desire to outlaw deceptive and misleading business conduct.

In fact, the size of the awards needed to change the conduct of powerful multinationals like IBM could well be much larger than this limitation would allow.

So the law is still in place. In Sydney informal expectations are that new IBM contracts will start to be accepted in late August — shortly after Parliament (which would have to approve any change in the law) reconvenes.

The former minister, J.W. Howard, goes to the European Economic Community trade negotiations with greater awareness of the problems of international trade, and Wal C. Fife steps in to oversee the situation that has developed when a sovereign nation meets up with a multinational. It will be interesting and instructive to see the outcome.

Letters to the Editor

Adabas Said to Include Nonprocedural Code

The June 13 issue of Computer*world* included a small item about an interface to Software AG's Adabas available with Ramis. The item incorrectly stated that Adabas does not include a nonprocedural language.

The Adabas system has not one but two nonprocedural languages. Adascript for on-line inquiry was released in the fall of 1973. Adawriter for batch report generation was released in January 1976 and enhanced in February 1977.

Also, last February Adascript+ was released to provide an on-line inquiry and reporting nonprocedural language. All of these have been distributed to all Adabas users at no additional charge.

Thomas R. Berriford
Vice-President
Software AG
Reston, Va.

Julian Date Mapping

In reply to Don Dietrich's inquiry about why YYDDD is called a Julian date [CW, July 11], the answer is quite simple.

Under the Julian calendar February always has 28 days, so DDD can always be mapped into the correct month and day. A Gregorian YYDDD would be erroneous in its mapping because of the variable length of February.

You would actually need a YYYYDDD format to correctly account for leap years. (Leap day is not introduced if YYYY is divisible by 100 and not by 400.)

Alexander Nesenjuk
Raritan, N.J.

Keeping an Open Mind

I suppose a program could be considered part of a mechanical device if it appeared in a read-only memory. Otherwise I would think not because mechanical devices do not have parts that disappear when you turn the power off.

It seems to me that getting a patent is a long, involved, expensive process (meaning that I probably couldn't afford it) and getting a copyright is short, simple and cheap.

To me, writing a program is at least in the same category as writing adventure stories. They may or may not involve a lot of "creativity," but all have copyright protection.

Nevertheless, I will consider the suggestion that programs ar~~e in a~~ class by themselves and, likewise, consider any suggested changes to existing laws or proposals for new ones.

It seems to me that any kind of "program copyright" law is going to be very useless unless we can find a way of enforcing it and I think that is going to be impossible.

Leigh Janes
Rocky Hill, Conn.

Another Alternative

You have recently published letters from representatives of various source library systems arguing their relative worth. Panvalet, Slick and Librarian do provide good security and they can be useful for management control, but they are not adequate for an installation that wants to raise standards of programmer productivity.

A library system is used more than any other tool. It can assist a programmer by cutting out a great deal of clerical work. Following are a few drawbacks of the well-known library systems.

Panvalet and Slick automatically resequence a program on every update. This makes it difficult to correlate different versions of a program.

Librarian and Panvalet don't recall previous versions when a program is updated. If you accidentally delete records 500-6,000 instead of 500-600, you may have an extra day's worth of work.

All three systems require corrections to be placed in ascending order.

Records cannot be copied from one place and inserted in another. This is of extreme importance both in rearranging records and in program composition.

Our library system, TXTM, has none of these shortcomings and its text manipulation language is simple and powerful. For example:

If column 10 is an "A," move columns 10-12 to 11-13.

If the character string "ABC" appears in a range of records, change the character which follows to an "X."

Keep up-to-date with computer developments!

MICROPROCESSOR ARCHITECTURE AND PROGRAMMING
William F. Leahy
A progressive, step-by-step approach to the complete spectrum of microprocessor components and techniques. The book gives a systematic presentation of classical computer concepts, microprocessor hardware, and the software programming techniques that make the best use of these devices.
(0 471 01889-9) 1977
approx. 352 pp. $19.95

A USER'S HANDBOOK OF SEMICONDUCTOR MEMORIES
Eugene R. Hnatek
This book was written from an overall viewpoint that uses all modern devices as illustrative examples. Without delving into intricate detail, Hnatek covers enough of the processing and technological aspects—as well as memory cell design types and tradeoffs, chip decoders, and sense amps—to give a clear understanding of how each technology is married to a circuit design philosophy to yield the best final result.
(0 471 40112-9) 1977
approx. 635 pp. $29.50

COMPUTER STORAGE SYSTEMS AND TECHNOLOGY
Richard Matick
Brings together all aspects of information storage technology and systems in one volume and relates the various aspects of data structure and usage to the hardware design. Provides a clearer understanding of how the design of the memory system relates to the computer's overall technology and programming.
(0 471 57629-8) 1977
approx. 784 pp. $30.00 (tent.)

ADVANCED ANS COBOL With Structured Programming
Gary D. Brown
Here's an in-depth examination of the complex statements that have evolved in COBOL programming. The book offers those familiar with programming—either in COBOL or another language—clear explanations and examples of such topics as: Table handling; Character-string manipulation; Report writer; Sort-Merge; Direct and indexed files; and Communications facility. The book's emphasis on advanced features, programming style and techniques, and structured programming makes expertise in COBOL easier to achieve.
(0 471 10642-9) 1977
497 pp. $19.95

MATHEMATICAL MODELING AND DIGITAL SIMULATION FOR ENGINEERS AND SCIENTISTS
Jon M. Smith
This book shows how to simulate complex continuous processes on a digital computer and attain excellent results at a lower cost. It covers numerical methods and computing algorithms for simulating linear systems, using methods developed in the late '60s, and nonlinear systems, using methods developed in the early to mid '70s.
(0 471 80344-8) 1977
332 pp. $21.00

THE COMPLEXITY OF COMPUTING
John E. Savage
This guide eases many of the difficulties encountered in writing programs for complex tasks—and making them run efficiently on existing machines. The focus of this volume is on space-time tradeoffs. The presentation compares many topics in theoretical computer science with models of general-purpose computers, giving you a unique synthesis of theoretical tools and practical machines.
(0 471 75517-6) 1976
391 pp. $22.95

SOFTWARE RELIABILITY Principles and Practices
Glenford J. Myers
Divided into four sections for easy reference. Myers discusses software reliability and the major causes of unreliability; design of reliable software; the broad area of software testing; and the important factors related to development of reliable software, such as project organization, programming languages, predictive models, and software support systems.
(0 471 62765-8) 1976
360 pp. $19.95

STATISTICAL METHODS FOR DIGITAL COMPUTERS Volume 3 of Mathematical Methods for Digital Computers
Edited by Kurt Enslein, Anthony Ralston & Herbert S. Wilf
This book focuses on major multivariate statistical techniques used by sophisticated statisticians, giving statistical background and computation techniques. Here are the popular statistical methods with instructions for applying specific methods to diverse problems.
(0 471 70690-6) 1976
454 pp. $24.95

ABEND DEBUGGING FOR COBOL PROGRAMMERS
B. H. Boar
This comprehensive book presents a study of methodologies and techniques available to debug Abend (Abnormal Ending) core dumps—an event for which most COBOL programmers are inadequately prepared. Using the ANSI COBOL language under the 360/370 OS/MVT operating system as the case study, the book provides systematic approaches to Abends most familiar to the COBOL/OS user.
(0 471 08413-1) 1976
321 pp. $18.50

THE MINICOMPUTER IN THE LABORATORY With Examples Using the PDP-11
James W. Cooper
Detailing the use of the minicomputer for the acquisition and analysis of laboratory data, this book describes the programming of the DEC PDP-11 minicomputer in language understandable to the beginner. Examples and problems take readers through each phase of the programming language. The book also covers the use of the computer as a tool for data acquisition and processing and includes a thorough discussion of signal averaging, spectrum display, plotting, and peak picking.
(0 471 01883-X) 1977
365 pp. $19.50

A PRACTICAL APPROACH TO COMPUTING
W.Y. Arms, J.E. Baker, & R.M. Pengelly
Offers the student with an elementary knowledge of programming an introduction to the basic concepts needed for effective computer usage. Each new concept is examined through practical applications with emphasis on drawing flow charts and writing programs.

When It Comes to Ethics

Golden Rule Applies to DPer Changing Jobs

By William A. Delaney
Special to CW

A recent Computerworld article discussed ethical, unethical and nonethical conduct on the part of programmers who take programs with them from one job to another and, possibly, hurt a former employer by delivering to a competitor software that was paid for and developed at the former place of employment. [" 'Who Owns a Program' Depends on Type of Software," CW, June 27].

The question of ethical behavior is a difficult and very subjective one. It can sometimes depend on where you stand. If, for example, you are the employer and pay a programmer a good salary for several years to develop software, you can argue that it belongs to your company.

The programmer can be ego-involved and determine that it is his work and brainpower that developed the software. The software therefore is rightfully transferable when the programmer takes on a new position.

There is no easy solution regarding the ethical question, and no set of guidelines will ever make anyone honest. This comes from within each of us.

I suggest, however, that the following factors be considered if anyone is trying to determine whether the transfer of a program from one company to the other is ethical.

- Did the new company hire you specifically because it knows exactly what you are doing? Is it in direct competition with your present or former employer for a particualr job or series of jobs? Is it more interested in specific work you are doing rather than your general experience and education?

If the answer is yes, the possibility of unethical conduct may exist.

- Did the new company ask you to bring specific programs, modules or subroutines with you? If so, be careful. The possibility of unethical or even illegal conduct may exist.

- Did you sign any conflict-of-interest statement at your former place of employment as a condition of employment?

If you did, then observe it now, even if you don't want to, because you gave your word in advance. Next time, don't give your word. Don't retroactively decide the argreement was wrong.

This is a rationalization of your behavior, because you don't want to keep your word.

- If you did not sign any conflict-of-interest agreement, you may be legally free to do what you wish; ethically, however, you may not be if you determine that bringing a program with you could damage your former employer's opportunity for business, expansion or growth.

No one can stop you on this one but your own conscience.

- If you find yourself taking program listings, printouts and other such data with you, then you may be in the area of unethical or illegal behavior. Especially if you are doing it secretly.

Ask your boss if he minds if you take it and see what the answer is. If you don't ask, watch out; you are in unethical territory again.

- You were paid every month for as long as you worked where you worked. The employer paid you for what you did and, legally, the result of your work belongs to the place that paid you to develop it.

When a carpenter is paid to build a house, he doesn't own it when it's done. Consider software in the same way.

- Ask yourself the following question: Would you approve of an employee doing what you plan to do if you owned or represented the company or organization for which you work or formerly worked? Then act accordingly.

If still in doubt, ask a qualified third party. (That's one of the jobs for clergymen, if you would care to discuss it with them, and it is guaranteed to be confidential.)

Don't ask relatives or friends — they won't be objective. They will tend to agree with whatever you say on the subject.

Reader Commentary

Trying to see it that way may help solve some questions of ethics. No one can stop you using your experience, education or training on a new job, and this is easily transferrable from one job to another. Indeed, that is what employers want when they hire experienced personnel.

If, however, in addition to taking copies of programs to your new job you use them very soon, and relatively unchanged, then be careful because this could constitute unethical conduct.

"Do unto others as you would have them do unto you." You can't miss if you use this rule, and it is easily transferrable from job to job.

Deloney is president of Anolysis ond Computer Systems, Inc. in Burlington, Moss.

The pioneer of small business computers now makes small business computers.

Actually, Basic/Four Corporation has been making its own central processing units since August, 1976. We now make our own terminals, too.

We wanted tighter rein on manufacturing and testing, choice of the latest components, total control of quality, production and delivery. So we could offer even more reliable, better products.

Now we do.

The Basic/Four® CPU's new semiconductor memory means 40% faster cycle time, down from 1 microsecond to 600 nanoseconds. New models make expansion even easier, accommodating one to 16 terminals. There are other improvements, too, with more to come.

And the Basic/Four systems we make have been running, bug-free. Just like before – only better. The best small business computers available.

All-around simplicity

We also made sure our system would be the easiest to install. And operate.

The software uses BUSINESS BASIC. And we have applications modules that are preplanned and packaged, including such eminently usable programs as CBS (Comprehensive Business System) and EASY, an exception analysis system. Plus a multitude of specialty packages. For hospitals, insurance, travel agencies, bond brokers, banking, the apparel industry, trucking, publishing – literally dozens, and more on the way.

Full time commitment

Our specialty is small business computers; it engages our full attention, dedication and effort. And, of course, as the pioneer, we've been at it longer.

Look to the pioneer

Ever since we pioneered the field, our operating system has been acknowledged as the best of any small business computer. It had to be – because our systems were always interactive, even when others were batch.

Nowadays, everyone in the field is talking "transaction processing" – following our lead, some six years later!

Long enough to have established through SORBUS INC., our sister MAI company, a national network of support and service, 24-hours a day, if needed.

All this leadtime and concentration keeps us ahead.

And now we make our own. So we *know* we're offering the best.

If you'd like to know more, call or write:
Basic/Four Corporation,

Constructive Criticism of NCC Welcomed

By Dr. Roger M. Firestone
Special to CW

As a member of the Program Committee of the 1977 National Computer Conference, I am writing in response to the letter from W. Thad Lee [CW, July 18].

Lee complained about the lack of parking, the lack of access to sessions for handicapped attendees and the crowding at certain sessions.

It is difficult to attach blame to the American Federation of Information Processing Societies (Afips) for the lack of parking space in downtown Dallas; certainly few people expected to find parking readily available in Chicago in 1974.

Unlike Chicago or New York, however, free transportation was available to conference attendees which, it was hoped, would reduce the need for parking.

Regarding architectural barriers to the handicapped, it was unfortunate the program booklet did not include the customary map of the convention center, which would have indicated the location of elevators. Perhaps they should have been marked clearly.

One elevator for passenger use was available just off the registration area, and it did receive frequent use.

I am confident further attention will he given to this area at future NCCs; the fact that buildings constructed prior to current federal guidelines on handicapped access must still be used will impose some limitations on how much improvement can be made.

As it was I who made the room assignments for the NCC, I must accept full responsibility for the problems and difficulties which resulted.

Room assignment is a difficult task. Having been a session chairman and speaker as well as an attendee at prior NCCs, I am aware of the many frustrations that improper room size can produce.

Lee should recognize that placing a session with 30 to 50 attendees in a room with capacity of 800 can be very damaging to a speakers' ego and equilibrium; additionally, it may discourage attendees from asking questions.

Room assignment was undertaken with only a limited number of rooms available for assignment. It was desired to achieve a physical grouping of session "tracks" with similar themes.

This indicated that the use of the theater building was not suitable for technical sessions; instead, it was used for personal computing sessions and some exceptionally large sessions.

Moreover, the professional development seminars were allocated some of the larger rooms; that they sold out to capacity indicates this was desirable and necessary. Others of the larger rooms were needed for exhibit registration and similar administrative purposes.

Reader Commentary

Past experience has shown the most technical sessions have usually had the smallest attendance because of their specialized nature. In this year's program, the technical tracks were assigned to smaller rooms for this reason.

However, the technical tracks also included some very popular speakers (Herb Grosch, Gene Amdahl and Ed Yourdon, to name a few) and two sessions were moved to accommodate crowds when the theater was available for reassignment.

Note that the ratio between the largest and smallest sessions on the tracks in question exceeded 60. The resulting problems should be obvious.

Best Ever

In many ways, the Dallas NCC was indeed the best ever for the largest number of people ever. Seldom will any enterprise of this size be run entirely without difficulties.

This year's steering committee is anxious to receive constructive suggestions of how improvements might be made in next year's conference. I am sure constructive criticism would be welcomed.

Are DPers Disconnected?

(Continued from Page 13)

Oh God, nice, NICE; was that all? That beautiful pastel city on a hill where the mist stole in each evening to the call of the fog horn. The feeling of romance was, I thought, everywhere in the lights of the night. And he said, "Nice."

What happens to a man's awareness of the sights and sounds of LIFE? Were they ever there, or were they lost somewhere in that damn computer which has no capacity to feel — or to love?

I don't know. Perhaps it's the inherent nature of the computer man — precise, exact, logical. It's true, San Francisco *was* nice, after that long Christmas day it *was* sensible to go to bed, and the sights and sounds are subjective, and so is love — thank goodness.

It's okay. This "human" has been "disconnected."

I'm glad you're writing about humans.

Painter Hoffman
Bethesda, Maryland

Give us your best.
We can make them better!

Honeywell is offering seminars and consulting services on state-of-the-art computer applications.

No matter what kind of system you're using, your people can learn to use it better and more effectively.

We offer seminars on a variety of Systems Sciences – on subjects like distributed systems, security and privacy, data center management, communications and networking, project management, and structured programming.

Seminars are scheduled regularly in major cities. Or they can be presented at your place of business.

For complete details, use the coupon. The sooner the better. The state-of-the-art is changing fast.

WE CAN HELP YOUR COMPUTER TO DO MORE OF THE WORK.

UCC software is solving problems in more than 1,500 installations. Worldwide. We can help your computer do more of the work, too. With software systems like:

TAPE MANAGEMENT: UCC ONE's 500 installations represent about ¾ of all installed OS tape management systems. UCC ONE manages your tapes and protects valuable data from loss or destruction. It provides real-time tape status. Eliminates costly, handwritten records and the expensive mistakes they breed. Gives you better control and greater efficiency.

DOS UNDER OS: UCC TWO lets you continue to use your DOS programs—without reprogramming—while you convert to OS. You plan the conversion or consolidation to fit your work schedule, instead of the other way around. You can consolidate your DOS operation into your OS/VS environment today. Or, you can spread the conversion—and the costs—over months. UCC TWO is the best path to OS and 500 users have proven it.

DISK MANAGEMENT: UCC THREE/ADAM solves the problem of inefficient DASD space usage. Based on user specifications, it automatically scratches unneeded, unused and invalid data sets. Or it will migrate the data sets to tape, based upon any combination of criteria—such as usage frequency, size and retention period. Then, UCC THREE keeps the problem from recurring by controlling data set allocation. Fragmentation and the need to periodically compress packs is reduced. Accurate reports on your current space utilization are produced.

PDS SPACE MANAGEMENT: UCC SIX is the only software package that eliminates PDS compression—because it automatically inventories and controls PDS disk space. It spells the end for ABENDS and "dump and restore" operations caused by exhausted PDS disk space. You even save money on your disk investment, too.

IMS DATA DICTIONARY/ MANAGER: UCC TEN is the standard IMS dictionary, with over twice as many installations as the Program Product offered by its nearest competitor. Not only does UCC TEN give you superior control over your data base environment, it also defines your data communication network, produces 3270 screen formats and generates IMS Stage I SYSGENS. Now, at last, you can get the benefits you expected from IMS.

RESTART/RECOVERY MANAGEMENT: UCC FIFTEEN lets you restart at the proper job step—instead of at the beginning. The OS catalog is corrected, unnecessary direct access data sets are deleted, and GDG biases are properly altered for the rerun. Automatically—so manual errors in restarting and rerunning are eliminated.

FINANCIAL SOFTWARE: The UCC General Ledger/Financial Control System is the most advanced and complete system of its type. Full general ledger accounting. Budgeting. Cost allocation and profit center reporting. It can generate over 100 standard reports. Plus, it has an easy-to-use report writer that the Accounting Department can use—with a minimum of EDP assistance.

SUPPORT: It takes more than code to make a good software product. It takes dependable, long-term maintenance and support of these products. And support is just one more way that we're helping the computer to do more of the work in more than 1,500 separate installations.

Reader Commentary

Reader Finds Reaction Confusing

Both Stone, Tannenbaum Have Good Points

By H. Andrew Shirley
Special to CW

I read with great interest Jack Stone's July 18 reply to Saul Tannenbaum on the question of professional ethics in training Iranian policemen in computer technology — and I discovered an amazing reaction on my part.

As I read Tannenbaum's letter, I felt sincere empathy with his point of view. At the close of his remarks I wanted to run up the stadium steps waving an American flag and shouting slogans about human rights.

Then I read Stone's reply and found I could relate nicely to his arguments for conducting the training program as he had.

To say the least, I was perplexed at my confusion about what I really felt and believed about this important issue.

I began contemplating the situation and determined that I agreed — and disagreed — with both men. Tannenbaum raised a very relevant question for today's DP community, but his approach seemed to be very idealistic. Although ideals should certainly be as high as possible, reality often dictates a different tune (it's like those TV commercials aimed at the "typical American" — there just ain't no such critter).

Tannenbaum's concern is commendable and I hope he continues to maintain his apparently high degree of integrity, but no father is going to deny his hungry child bread because he doesn't like the way the baker parts his hair. Instead, he might try convincing the baker to change his hairstyle.

As for Stone, given the same set of circumstances I would have done as he did — forge ahead with the training program. However, I have the impression, and perhaps erroneously, that Stone believes he is not his brother's keeper.

Professional ethics sometimes walks a very thin line where a mere change in attitude can spell the difference in what's ethically right or wrong. Maybe Stone was only miffed over what he took to be grave and serious accusations, but whatever the motive his rebuttal reeked of callous indifference which, in my opinion, stood on the brink of being unethical.

To kill a sick animal because he's sick is one thing, but to kill a sick animal because you like killing . . . I think you see my point.

At the close of his statement Stone questioned whether he should become a committee of one and "rock the boat" when everyone else seemed content to stay seated.

I don't know Stone's religious preference, but I would recommend he read the story of Elijah in the Bible (I Kings, Chapter 19), where the Lord demanded to know why Elijah was hiding in a cave when he should be out taking a stand for God. Elijah's answer was, in effect, that he was a committee of one and there was no use trying. The Lord then replied that this was not so, there were 7,000 more of whom Elijah knew nothing.

The application is clear. If each one of us refuses to rise and be counted on an individual basis, we might as well hide away in a cave. But when we do speak out, we find others around us also crying out and presenting a unified front.

Stone's reasons for doing what he did seem valid to me; our government does have a friendly policy toward Iran and it is true someone else would have done the work if Stone's organization had not.

However, I wonder if Tannenbaum's original question of unethical practices is closer to the truth than Stone thinks, but for entirely different reasons.

The DP community needs to be concerned about privacy legislation, human rights and professional ethics and it needs to take a realistic approach to these issues, but hiding one's head in the sand is no more realistic than trying to ride a rainbow.

Shirley is DP monoger of Mulberry Construction Co. in Mulberry, Flo.

Value of Software Copyright Lies in Incentive to Create

By Jonathan Sachs
Special to CW

Author John Hersey has argued that copyright protection is inappropriate for computer programs because a program is a "mechanical device, which is engaged in the computer" [CW, July 4]. I am not convinced.

To accept this argument, we must strain the concept of a "device" beyond its usual limits — an effort which is awkward and unnecessary.

The Supreme Court used Hersey's argument in 1908 to deny copyright protection to musical compositions that were pirated by a piano roll maker (White-Smith Music Publishing Co. vs. Apollo Co.). Congress promptly incorporated such protection in a revision to the copyright law.

Recording of copyrighted music has been regulated by the law ever since, and neither the law nor the recording industry has suffered.

A program that is installed on a computer is nothing "strikingly new in our culture," as Hersey contended. It is not essentially different from music on a phonograph record — or a piano roll.

The problems of imitation, transaction charging, networking and so forth all have analogues in the recording and broadcasting industries. We are dealing with problems that have been solved before, and we need not resolve them from scratch.

Copyright and similar protection is a legal "monopoly license" designed to ensure creative people receive a fair reward for their efforts and so give them an incentive to work. It is settled law that the protection should be broad enough to accomplish this purpose — and no broader.

The program protection issue is therefore basically economic: What protection is needed to ensure that programming develops vigorously, as an art and an industry? Hersey's arguments about what a program "is" are off the point.

I believe that copyright protection is quite adequate for computer programs. No major innovations are necessary.

Sochs, troined os on ottorney, is o freelonce writer in Son Corlos, Colif.

'Midas' Controls Add to DG's RDOS

NEWTON CENTER, Mass. — The Management Information Data System (Midas), created by Management Techniques, Inc. (MTI) to simplify operations on full-sized machines, has been adapted to the Data General Corp. RDOS environment, providing users with facilities not available from DG, according to MTI.

Under Midas, all the functions of the system are performed by control programs invoked by operator-entered commands. The ultimate goal of the Midas development is to support "operatorless, programmerless, skill-less data processing," a spokesman explained.

The current Midas provides three levels of protection for the user, he claimed. A log-on procedure, for example, prevents unauthorized users from gaining access to the system in the first place, he said.

Although Midas has the ability to support many commands, installations often wish to limit the number and type of instructions available to their operators. A "profile" routine screens incoming commands against a user-defined list of acceptable ones, processes those that are valid and blocks those that are not.

Finally, the system has the ability to monitor runs, tracking successful execution of predecessor runs before allowing the current work to get under way but stopping execution if prior work remains to be done.

Also built into Midas, the spokesman claimed, is a facility for storing strings of commands - including conditional branches — for execution upon later entry of a single routine name.

Midas runs in 16K under RDOS on any DG machine which supports that operating environment. The MTI software is available for $1,000 plus $10/mo maintenance or as part of the cost of various application programs also available from MTI.

MTI is at 28 Tanglewood Road, Newton Center, Mass. 02159.

'Culprit' Eases Formatting

WELLESLEY, Mass. — Release 4.3 of the Culprit Output Processsor package from Cullinane Corp. is said to provide automatic report formatting and an extended macro facility to ease coding and simplify report alterations.

The Automatic Header Generation supports three forms of column labelling: posting the predefined field name; posting a literal, but leaving placement up to the user; and posting a literal which the system always associates with defined fields, a spokesman said.

The Info-Column Specification feature allows the user to leave the positioning of columns across the page up to the system. This facility can be combined with the Automatic Header Generation or used independently, he added.

Release 4.3 extends the previous COPY facility that allowed users to combine sections of existing code to form new report specifications. With the update, users can delete or resequence specified parameters, change print formats or alter logic to produce new reports without coding entirely new parameters.

The enhanced Culprit also supports floating dollar sign specifications and user edit masks that perform a range of functions including zero suppression, decimal point insertion and negative value specification.

Culprit can be used in any IBM 360/370 environment from DOS through OS/MVS. It requires a minimum partition of 64K bytes to handle two or three reports under DOS.

The basic package costs $20,000 plus 10% each year for maintenance after the first year. The features in Release 4.3 are included in the various specified versions of Culprit as well, Cullinane said from 20 William St., Wellesley, Mass. 02181.

Special Modules Extend Fixed Asset Accounting

SANTA CLARA, Calif. — Construction in progress, asset maintenance and leased asset reporting are capabilities included in an enhanced version of the Fixed Asset Accounting System now available from Data Design Associates, according to a spokesman.

The base system, written in ANS Cobol and implemented on a wide range of hardware, supports book and tax depreciation accounting, the federally sanctioned Asset Depreciation Range reporting and the Securities and Exchange Commission's Replacement Cost Accounting, he noted.

In addition to its newly available property accounting capabilities, the package includes a user-controlled report writer feature. This gives users an expanded level of flexibility in building their property data bases and extracting reports in any desired format, the spokesman stated.

The software runs in 64K bytes., It has been installed on IBM, Burroughs, Honeywell, Univac, Data General and Hewlett-Packard systems and efforts are under way to include Digital Equipment Corp. and NCR equipment, he added.

The base package costs $12,500, but typical configurations are higher than that, depending on which of the specialized modules are selected.

Data Design Associates is at Suite 418, 1333 Lawrence Expressway, Santa Clara, Calif. 95051.

'Mark IV' Version Handles EEO Jobs

WOODLAND HILLS, Calif. — The 43 standard reports available with the Mark IV/EEO & Affirmative Action Reporter package from Informatics, Inc. are said to incorporate all aspects of compliance reporting requirements, from evaluation of workforce composition to comparisons of external labor markets.

A basic Mark IV system and the EEO Report module cost $21,000; current users of Mark IV can get the module by itself for $3,700.

Informatics is at 21031 Ventura Blvd., Woodland Hills, Calif. 91364.

'QShare' Aids Spooling

GREAT NECK, N.Y. — QShare from Labyrinth Systems Ltd. is an enhancement to the Power/VS queues spooling software supplied by IBM that allows multiple CPUs in a shared environment to access the same Power/VS and data files.

Although each CPU in the configuration must have a memory-resident copy of Power/VS to utilize QShare, each need not have its own reader, punch, printer or other "unit record" devices, according to a Labyrinth spokesman.

The Labyrinth package can locate the next available device of the type needed and route the job to it, even if it is not attached to the CPU that initiated the job, he said.

On the other hand, attaching all unit record devices to a single CPU optimizes the effectiveness of QShare by eliminating its need to search through other systems for available peripherals, he added.

The ability to match available devices to current work requests may improve throughput performance as well as save the cost and space requirements of equipment which might be unnecessary with QShare in place, Labyrinth said.

A perpetual license for QShare costs $7,500. Lease and rental agreements are also available, Labyrinth said from 17 Barstow Road, Great Neck, N.Y. 11022.

Data Basics

Picking a Winner — Part I

Technicians Alone Should Not Select DBMS

By Robert B. Chamberlain
Special to CW

An idea currently prevalent is that selection of a data base management system (DBMS) is rather exclusively in the purview of an installation's senior technical personnel — those honchos and near-honchos who possess an almost mystical combination of arcane knowledge about the shop's current application systems and well-honed analytic skills regarding state-of-the-art softwre.

I believe giving these "phenoms" DBMS selection powers (with perhaps the sop to user departments of having an onlooker present with the right of free speech) is somewhat akin to leaving the fox in charge of the henhouse.

The issue is not the adequacy of the analysis of a package's technical credibility, but rather the stress put on that aspect of package selection and whether proper planning has been done prior to the technical evaluation of a package — in other words, whether such data base amenities as a proper information flow analysis (IFA) and service analysis have been observed [CW, May 23, 30].

The performance of such essential preselection and preinstallation activities will, if done with a proper commitment, sufficiently involve key individuals from user departments to the point where they will have gained insight into data base in philosophy and practice and, by virtue of their involvement, have contributed key input to the package selection process and therefore have become an integral part of the process.

Lukewarm user involvement only brings a token commitment of the user representative. The old cry, "I tried to tell them but they wouldn't listen to me," is guaranteed to come up at the first sign of a crunch (and some crunch is historically inevitable).

'Vested Interest'

Relying on senior technical people as experts on current applications creates a "vested interest" problem. This problem arises not from a failure to completely understand the present system, but from a reluctance to fully appreciate the possibilities inherent in a new one.

This reluctance, in turn, comes from a desire to protect a position of expertise (job security, in other words) and from another natural human tendency, that of re-creating the known in preference to doing the unknown.

In data base terms, this means the conversion of existing systems to DBMS systems instead of a data base-oriented redesign of existing systems. A foot-in-the-door to the conversion approach can come from an approach which says, in effect, "We in DP know the system, so why bother the user by asking questions about what he needs."

User Excluded

The user has now been effectively excluded from the problem-defining environment (in our data base terms, an IFA and service analysis), an action which guarantees his exclusion from the problem-solving environment (data base file design and DBMS package selection).

It should be observed that there is no advocacy here of having underwriters and loan officers evaluating recovery/-restart capabilities and speaking knowingly of inverted files and ring structures. That sort of technical evaluation does belong properly to the best of the DP staff (perhaps working with a consultant to help offset what might be politely called vendor "enthusiasm" regarding their products).

Technical evaluation, however, is only the final stage of the data base effort, an effort properly seen as a corporate commitment to a data base effort. An example from another aspect of corporate life will illustrate the nature of the data base package selection effort.

Assume that a Personnel Department is encountering increasing strain in meeting its responsibilities to and inquiries from other departments in a corporation. Assume further that several approaches to solving Personnel's dilemma were available and the selection and acquisition of one of them would entail both time and money.

It is highly unlikely this decision could be made in a vacuum by Personnel Department staff alone. It is furthermore unlikely Personnel could unilaterally make a formal recommendation without a give-and-take with user departments regarding the logic of the various solutions and their impact upon the user and his current and future requirements.

Point of Absurdity

And it is even more unlikely, to the point of absurdity, that Personnel would claim that it alone had the real truth and right of possession to personnel data.

Yet this same type of thinking is not uncommon in DP, both in its everyday working and in its data base package selection process.

In his next article, Chamberlain will discuss a "political solution to a political problem — the selection of a DBMS."

Chamberlain is a senior consultant, information systems, with CACI, Inc. — Commercial, New York, now on assignment in Europe.

Course Details Report Writer Use

KANSAS CITY, Mo. — Students completing the ANS Cobol Techniques/Report Writer course module from The Edutronics Group can decide when conventional report processing should be used instead of the Cobol Report Writer feature.

Intended for DP managers who need an overview of the features's capabilities and limitations and for programmers and operations personnel who may need to produce "quickie" reports, the course should take three hours, depending on the skill level of the user, a spokesman said.

The course shows that most printed reports have certain elements in common and that there is an inherent logic to using a generalized routine such as Report Writer.

It shows how to use the Cobol feature but, through example, the course also shows when special needs make the generalized approach inappropriate, he noted.

The training program is available under Edutronics' library lease plan. It can also be purchased for $390, from 3435 Broadway, Kansas City, Mo. 64111.

Infonet Installs Modeling System

EL SEGUNDO, Calif.— Sciconic, a mathematical programming system developed by Scicon Computer Services Ltd. of England, is now available on Infonet, Computer Sciences Corp.'s (CSC) time-sharing service.

Working with a unique high-level language, the Sciconic user can find an optimum solution to a problem having millions of possible answers, CSC claimed.

CSC is headquartered at 650 N. Sepulveda Blvd., El Segundo, Calif. 90245.

Data General. A la carte.

Now, you can buy our DASHER™ terminals, even if you don't own a Data General computer system. Select our fast impact printer and our user-oriented video display. Both are interface-compatible with any standard computer system.

Choose either 60 or 30 cps versions of the DASHER printer, which has a standard typewriter keyboard, u/l case, 132 columns.

DASHER display features a 1920 character screen, u/l case, convenient detached keyboard, programmable function keys, and a monitor that tilts and swivels.

Just as DASHER terminals' features make them easy to use, their attractive appearance makes them easy to fit into any environment. And of course they are solidly reliable and easy to maintain, a Data General trademark. For more details call your Data General sales office or nearest independent supplier of Data General terminals. Or send the coupon. Even a bit of Data General in your computer system is better than none.

Send details on ☐ DASHER printers ☐ DASHER displays
☐ Have salesman call.

It's smart business

Data General, Westboro, MA 01581, (617) 366-8911. Data General (Canada) Ltd.,
Ontario. Data General Europe, 15 Rue Le Sueur, Paris 75116, France. Data General Australia, Melbourne (03) 82-1361.

Systems Seminars Set

WELLESLEY, Mass. — A five-day seminar on business systems analysis and design will be held in Nashville, Tenn., late this month and repeated in Toronto, Seattle and here in Wellesley later.

Sponsored by Honeywell Information Systems, the course should be useful to systems analysts, programmers, staff technicians and user department personnel, no matter what kind of DP equipment they have available, an HIS spokesman said.

The course shows how to develop and design systems. Lectures present an approach and workshops give "hands-on" experience using it.

The course costs $395/person, according to HIS's manager of educational services, 110 Cedar St., Wellesley, Mass. 02181.

More RJE Support, Too

Sycor Adds Basic for 440 Systems

ANN ARBOR, Mich. — Sycor, Inc. has introduced Basic for use on its 400 series of distributed data entry/-processing systems. The newest of Sycor's languages provides users with mathematical and problem-solving capabilities generally associated with time-sharing computers, a spokesman noted.

At the same time, the company also introduced Burroughs Remote Job Entry support for its 440 distributed data entry/processing system. This provides Burroughs users a means of accessing peripherals unique to the Sycor system as well as devices with which they may be more familiar, he added.

Sycor Basic supports both sequential and direct-access files, all of the common algebraic operators including arithmetic and relational symbolics, concatenation and Boolean logic capabilities, Sycor said.

Exponents to the power of +38 or -39 are provided, while three-dimensional arrays are limited by available memory. Floating-point, single-precision numbers may be up to seven digits, the spokesman added.

On a more scientific side, Sycor Basic supports the trigonometric functions — including sine, cosine, hyperbolic cosine and others — as well as logarithms and square root, he said.

Even while a 400 series processor is operating in Basic, data entry applications can be operating through other keyboards, he added.

The Basic software will be available for a one-time charge of $750 in the fourth quarter of the year, Sycor said.

The Burroughs support will be available for customer use by the end of next month, the company stated.

CDC Disks, DOS/RS Now on 360

PARK RIDGE, Ill. — Users of IBM 360/50s or 65s running under Dearborn Computer Co.'s DOS/RS operating system can now include Control Data Corp. 38301/33301 disk subsystems in their configurations, according to a Dearborn spokesman.

A joint development effort by CDC and Dearborn has made it possible to attach the 38301 controller to the IBM selector channel, with the 33301s — equivalent to IBM's 3330-1 disk drives — then cabled to the controller, he said.

The CDC 38301 microcode has been extensively modified to handle the 360 selector channel times instead of the 370 block multiplex channel times for which the controller's code was originally designed. The microcode changes are available from Dearborn on a floppy disk, the spokesman noted.

Programming added to DOS/RS to handle the CDC peripherals increase the memory requirements of the operating system by about 1,400 bytes, he said.

Version 6 of DOS/RS, currently available, costs $13,750. Version 7, which will include 10-partition support, is scheduled for delivery at year-end and will cost $19,750.

Dearborn is now located at 1460 Renaissance Drive, Park Ridge, Ill. 60068.

THE COMMANDING GENERAL

Why our new General Ledger System enjoys a commanding lead over the competition.

Attention!

Our new General Ledger/Financial Analysis System, G/L PLUS, deserves a twenty-one gun salute. Because even though it's brand new, its remarkable features have promoted it into a leadership position over everything else on the market.

First of all, the system is simple to use, with a revolutionary file design that allows unsurpassed efficiency and flexibility.

Secondly, the system is easy to maintain. We made it so compact that it comprises only 18 programs instead of the typical 50 to 200.

It's also the most comprehensive system available. Because we filled it with unusual features like automatic interface to any application subsystem; extensive planning and modeling facilities; complete user-defined editing and user-controlled error recycle; and comprehensive graphic reporting.

And of course, we included features like multi-corporate processing of both accounting and statistical data; extensive capabilities for any financial reporting requirement; consolidations, cost allocation, fixed and variable budgeting, exception reporting, foreign currency translation, and more.

Finally, there's a user-support program that includes not only installation, but a special user training school.

Now our Commanding General, G/L PLUS, is ready to stand inspection whenever you're ready.
If you'll contact Bob Wilbur,
we'll be proud to pass
in review.

McCORMACK & DODGE CORPORATION
361 Elliot Street, Newton Upper Falls, MA 02164, (617) 964-6610

DDS Rates Filed to Boost Users' Bills 5%

By Ronald A. Frank
CW Staff

WASHINGTON, D.C. — AT&T has filed new rates for its Dataphone Digital Service (DDS) that would increase users' bills an average of 5%.

The proposed higher rates were filed with the Federal Communications Commission (FCC) here to be effective Oct. 23 if approved by the commission.

The rates were filed in response to an FCC order which required Bell to cover the costs of providing DDS in the rates it charges to users. The FCC order was issued after the commission determined DDS rates were too low.

DDS is a digital service for data communications users that is available at transmission speeds of 2,400-, 4,800- and 9,600 bit/sec, 56 Kbit/sec and 1.544M bit/sec in 24 metropolitan areas.

The effect of the proposed rates will be to increase costs for short-haul, low-speed users while decreasing costs for long-haul, high-speed users, according to an AT&T spokesman.

The rates filing was the second of a two-step response to the FCC order that AT&T has undertaken to bring DDS rates in line with the cost of providing the service. In March, AT&T implemented "interim" DDS rates which were an average 20% higher than the tariffed charges in effect at the beginning of 1977.

Under the latest rates, a customer operating between New York and Chicago faces both increased and decreased costs at the lower DDS speeds. At 2,400 bit/sec, the January rate was $476.92/mo; this would jump to $509.24/mo.

At 4,800 bit/sec along the same route, the old rate was $688.44/mo while the new rate would drop to $674.64/mo, AT&T said.

At higher speeds and distances, users would benefit from rate reductions. From New York to Los Angeles at 9,600 bit/sec, the old rate was $2,591/mo while the proposed rate would be $2,273/mo. At 56 kbit/sec, the old rate was $10,647/mo while the new rate would be $8,666/mo, AT&T said.

Rates at 1.544M bit/sec remain unchanged.

The interim rates now in effect represent a 20% increase over the rates in effect last January; the latest rates are 5% higher than the January rates. As a result, the proposed rates should average about 15% below the interim charges, the AT&T spokesman said.

Users and other parties interested in commenting on the proposed DDS tariff should respond to the commission's Common Carrier Bureau by Aug. 19. The bureau is currently analyzing the AT&T proposal, an FCC spokesman said.

No decision has yet been made on whether the commission will approve, reject or suspend the rates pending a regulatory proceeding.

Raytheon Extends PTS/ 1200 Downline

NORWOOD, Mass. — Raytheon Data Systems Co. has introduced a software enhancement for its PTS/1200 line of distributed systems which it said permits users to extend six capabilities of those systems to smaller remote locations within distributed networks.

PTS/1200 systems with the downline terminal support enhancement reportedly allow users to perform source data entry and preprocessing, file and record maintenance, unattended two-way communications, standalone batch processing, report printing and interactive transactions with a host mainframe in IBM 3270 emulation.

With the capability, users can install PTS-100 programmable terminal configurations in smaller offices which may function as satellites to the PTS/1200 site, according to Raytheon.

The downline keyboard/CRT terminals connected to PTS-100 control units can operate in emulation of IBM 3270 equipment, a spokesman noted. Normally, separate communications lines between those PTS-100 configurations and a host mainframe would be needed to tie smaller offices into a distributed computing network, he said.

Data is transmitted and received between PTS-100 control units and the host PTS/1200 controller at speeds up to 4,800 bit/sec under IBM Binary Synchronous Communications protocol, the company stated. Data transmitted from PTS-100 controllers is typically stored in the PTS/1200 and forwarded to the mainframe when necessary at 9,600 bit/sec.

The PTS/1200 controller handles communications between its PTS-100 systems and the mainframe; programs written for local PTS/1200 terminals in Raytheon's Macrol programming language can be modified for communications with remote PTS-100 terminals, the spokesman said.

There is no charge for the downline terminal support software; the modem adapter needed to link a PTS-100 to a PTS/1200 is available for $21/mo. The enhancement will be available in the fourth quarter from Raytheon at 1415 Boston-Providence Tnpk., Norwood, Mass. 02062.

AT&T Links Non-Bell Units to TNS

NEW YORK — An AT&T plan to enhance its DP-oriented Transaction Network Service (TNS) in 1978 will allow users of the communications service to attach non-AT&T automatic teller and point-of-sale terminal devices.

The enhancement is an interface designed to support character-polled terminals.

The NCR Corp. Model 279 financial teller terminal is the first independent device selected for use on TNS, which is operational in Washington through Pacific Northwest Bell and also in Minnesota, according to an AT&T spokesman.

TNS was developed to meet the needs of high-volume, short-message inquiry/response applications. It offers network and message control and low error rates with two methods of terminal access — dial-in and polled, the spokesman said.

The dial-in mode accommodates Bell Touch-Tone telephones, Transaction I and II telephones and compatible customer-provided equipment.

The polled access mode accommodates the Bell Transaction III terminal and customer-provided equipment using the same protocol.

The enhancement should keep the cost of using TNS the same as it has been since operations began at the end of last year, according to the spokesman.

There is one exception, however, because compatible terminals must be four-wire devices. If they are not, the additional expense for an extra two-wire loop is about $10- to $15/mo, he noted.

Bell's TNS may be expanded to other states, according to the spokesman. That will depend, however, on the particular Bell company in each state and whether users find the service attractive, he added.

Prentice Upgrades Speed of SLD

PALO ALTO, Calif. — Prentice Corp. has enhanced its synchronous line driver (SLD) to a maximum speed of 28.8 kbit/sec.

The enhanced switch-selectable SLD 28.8(M) is capable of transmitting data up to six miles over nonloaded cable, the company said.

With its multiple data rate, IBM users can upgrade from 2,400- to 4,800-, 7,200-, or 9,600 bit/sec, Prentice noted.

The SLD incorporates diagnostics including local and remote loop-backs, nine LED indicators and pseudorandom word generation for self-testing, the company added.

A rack-mount version of the high-speed SLD costs $790, according to Prentice at 795 San Antonio Road, Palo Alto, Calif. 94303.

HIS Sets Four-Day Courses

WALTHAM, Mass. — Honeywell Information Systems, Inc. is offering a number of four-day programs on the subject of data communications intended for programmers, analysts, designers and managers of small/medium systems.

The courses are designed for the user evaluating or planning a system using data communications, whether or not Honeywell equipment is used, according to a HIS spokesman.

The first course is scheduled for Aug. 22-25 at the HIS offices in Cincinnati. The courses will also be held in New York City Sept. 19-22; in Minneapolis Oct. 17-20; in Columbia, Md., Nov. 14-17; and in Detroit Dec. 12-15, he said.

Participation in each seminar costs $395. Further information can be obtained from Dave Cook, HIS' manager of educational services, at 110 Cedar St., Wellesley Hills, Mass. 02181.

Vadic Introduces Registered DAAs

MOUNTAIN VIEW, Calif. — Vadic Corp. has brought out two Data Access Arrangements (DAA) which have been registered under the Federal Communications Commission's (FCC) long-form Rule 68.

The single-channel VA851 and the dual-channel VA852 have transmit-level control circuitry which continuously monitor each modem's output level, Vadic said.

If the output exceeds the programmed level, the circuit automatically reduces the level to protect the line. An LED simultaneously provides an indication of that situation to alert the operator, Vadic added.

All circuitry is mounted on a printed circuit board which occupies two slots in a standard Vadic chassis.

The VA851 costs $135 and the dual-channel VA852 is priced at $215, Vadic said from 505 E. Middlefield Road, Mountain View, Calif. 94043.

DTC Raises Dumb Devices' IQ

CAMPBELL, Calif. — Data Terminals and Communications (DTC) has a compact computing system that can make any Ascii terminal an intelligent device, according to the firm.

The Microfile combines an Intel 8080A microprocessor with one or two dual-floppy disk drives to give up to 1.2M bytes of on-line storage and up to 56K bytes of random-access memory (RAM); DTC Extended Basic software is also available.

A terminal used with the system can interact through an RS-232 interface with either a host time-sharing system or a second terminal at speeds from 100- to 9,600 bit/sec, according to DTC.

Standard Software

Standard software includes a text editor. Also included are mailing list maintenance and an automatic letter writer.

Prices start at $4,595 for the Model MK IIA with the single-drive dual floppy and at $6,750 for the MK IV with two dual-floppy drives, each has 8K of RAM. Extended Basic is a $500 option.

DTC is at 1190 Dell Ave., Campbell, Calif. 95008.

Omron CRT System Has Floppy Disk Unit

SUNNYVALE, Calif. — Omron Electronics, Inc. has unveiled the Model 8035, a stand-alone CRT terminal system based on an Intel Corp. 8080 microprocessor and featuring a floppy disk subsystem.

The intelligent terminal system includes an IBM 3740-compatible dual-floppy disk providing up to 4M bits of auxiliary data storage and allowing generation of a library for program loading, according to the firm.

System functions are held in random-access memory from 20K bytes in the basic Model 8035 to an optional 65K and are under control of the floppy disk operating system, Omron stated.

The operating system software package consists of an assembler, editor and debugger as well as file management routines to handle file creation, deletion and modification, Omron said.

Utility programs which are said to enhance operating simplicity are included in the floppy disk subsystem package.

Because the terminal system offers programmability, the 8035 can be used for application-specific program development, Omron claimed.

These programs optionally can be translated into firmware-based custom terminal designs by Omron and manufactured in quantity, it added.

The terminal system can transmit data at speeds up to 9,600 bit/sec. It comes with a CRT, alphanumeric keyboard with separate numeric-and function-key pads and an RS-232C interface.

Optional peripherals, such as a 120 char./sec printer, can be added to the terminal system which costs $7,200 from Omron at 432 Toyama Drive, Sunnyvale, Calif. 94086.

Terminal Transactions

AJ Boosts Speed Of Teleprinters

SAN JOSE, Calif. — Anderson Jacobson, Inc. (AJ) has a 1,200 bit/sec full-duplex option for its AJ 860 and AJ 860/A desktop printer terminals.

Option 860/120 permits either unit to operate at line speeds of 1,200 bit/sec in full-duplex mode over leased lines or the switched network, according to a spokesman.

Terminal buffer overflow protection for both terminals is provided through the use of the off/on Ascii control code sequence, the company added.

Either teleprinter equipped with the option can also operate at 10-, 30-, 45-, 60- or 120 char./sec.

Option 860/120 costs $400 and will be available in the fourth quarter from AJ at 521 Charcot Ave., San Jose, Calif. 95131.

Does your Honeywell VIP take a big bite per byte? Our Harris 8770 doesn't.

Our new Harris*8770 can do everything your Honeywell 7700 or 775** can do—yet ours costs 10% to 30% less.

That's not all.

When you call us, we respond. For example, our average response time for maintenance is less than three hours. And you can understand why. Terminals are the only things we design, make, install and service. They're our entire line, not just a small piece of it. Stands to reason we give terminals all our attention.

And that's not all.

We build communications monitoring capabilities and self-test programs into our terminals. This not only lets you detect system failures and debug new applications. It also helps isolate any problems in your front end, communications lines, modems, terminals or printer's basic operations.

Result? A lot less downtime

But even that's not all.

Harris terminals run without glare, heat, noise. They're lightweight, compact, trimly designed. Easier to work with, look at, move around.

Harris terminals. They help you fight the big-cost bite. Why not phone or write for details and a demonstration? **Harris Corporation, Data Communications Division, Daniel Webster Highway South, Nashua, NH 03060. 603-885-6685.**

Bits & Pieces

Hand-Held Unit Scans OCR-Imprinted Tags

DAYTON, Ohio — A hand-held scanner which reads prices and other information printed in an optical character recognition (OCR) font on merchandise tags in retail stores is available from NCR Corp. here.

The NCR 7867, a six-ounce pistol-shaped device, is immediately available as an option with the NCR 280 and 250 systems. It will be available for the NCR 255 and 2151 systems in the future, according to a spokesman.

Users can specify the type of format used on merchandise tags by filling out a specification sheet, the spokesman said. The unit is then delivered with a programmable read-only memory chip which incorporates those specifications, he said.

The scanner costs $1,500 and is available in both U.S. and international versions.

Memory Map Runs CP-V System

IRVINE, Calif. — A CPU enhancement from Telefile Computer Products will permit Xerox Corp. Sigma 5 users to process CP-V and CP-R software, a Telefile spokesman claimed.

The Telefile T8215 Memory Map is supplied as a package consisting of three logic modules, a diagnostic program tape and a Telefile CP-V starter tape. All memory map hardware is mounted inside the Sigma 5 CPU cabinet, the spokesman said, noting a limited number of internal writing changes are also required, but these adhere strictly to the Sigma 5 logic-loading specifications.

The memory map costs $18,200 from the firm at 17131 Daimler St., Irvine, Calif. 92714.

Reader Creates Dry Prints

ST. PAUL, Minn. — A compact microfiche reader/printer that produces dry-silver prints from fiche produced from source documents or by computer output microfilm (COM) systems is available from the 3M Co. here.

The 800 reader/printer produces a print in 10 sec, a spokesman said. It creates prints of 8.5- by 11 in., 11- by 8.5 in. and 8.5 or 11 in. square.

The 800 reader/printer costs $1,336 from 3M at P.O. Box 33600, St. Paul, Minn. 55133.

Burroughs Adds Mainframes To B3800 Medium-Scale Series

By Frank Vaughan
CW Staff

DETROIT — Burroughs Corp. has added two models to its B3800 medium-scale mainframe series.

The B3834 and the B3835 share the same 4MHz CPU, according to a spokesman. The additions to the line are equivalent in power to the B3830, the B3834 differing in that it is limited to 500,000 bytes of memory and 32 I/O channels as opposed to the 3830's 1M byte and 40 I/O channels. The 3835 differs in that it uses a more advanced memory technology requiring less space and lower costs, the spokesman explained.

The memory technology featured in the B3835 is 4K bit/chip metal oxide silicon (MOS). The 4K technology provides for a reduction of up to 25% in floor space for the system as opposed to other B3800 systems, he claimed.

Both systems are object code-compatible with all other Burroughs medium-scale systems and programs can be run with no recompilation necessary, he said.

Peripheral interface requirements for the two systems are the same as for other Burroughs medium-scale systems, the spokesman said. Both systems utilize an I/O subsystem which offers a Data Link processor for each channel. The processor cycle times vary with the peripheral, and channel transfer rates up to 4M byte/sec can be attained, he explained.

Memory access time on the systems is 500 nsec for every two 8-bit bytes.

A basic B3834 features 100,000 bytes of error-correcting, 1K bit/chip memory expandable in 50,000-byte increments to 500,000 bytes. The system comes with 16 I/O channels expandable to 32 channels. Equipped with operator display and console, the system costs $231,320 or $5,275/mo on a five-year lease. Lease prices include maintenance, the spokesman explained, noting the system is available for immediate delivery.

The B3835 in a basic configuration comes with 16 I/O channels expandable to 40 channels. It features 500,000 bytes of 4K bit/chip memory expandable to one million bytes. The system, with operator display and console, costs $317,560 or $7,550 with maintenance on a five-year lease. First deliveries are scheduled in the first quarter of 1978, the spokesman said.

Self-Sharpening Burnisher

Devices Clean, Certify Tapes

WOODLAND HILLS, Calif. — Two products, a tape winder/cleaner and a winder/-cleaner/certifier, have been introduced by Data Devices International, Inc.

The series 310C winder/cleaner features a self-sharpening multicontact burnisher which cleans the oxide surface of tapes. Two rolls of continuous-filament cleaning fabric remove dust attracted to the reel by static electricity, a spokesman said.

The series 310C is available in versions to handle .5-, .75-, 1- and 1.5-in. tapes. Winding control permits tape to be cleaned and wound at between 300 ft/min and 1,200 ft/-min. The unit sells for $4,995.

The series 330 winder/cleaner/certifier retains many of the features of the series 310C, the spokesman claimed. It uses separate, three-channel ferrite record and reproduce heads. The erase head erases the full width of the tape, he said, noting the head life is 3,000 hours at certify speed, the equivalent of 12,000 reels of 14-in. tape.

The unit's three-speed system operates in a bidirectional mode with either automatic or manual control.

The unit sells for $10,950 from the firm at 6301 DeSoto Ave., Woodland Hills, Calif. 91367.

Paper Feeder Bows

HAYWARD, Calif. — Qume Corp. has introduced a paper feeder for its daisywheel printers. The feeder will enhance the output of printers in word-processing and DP systems, the firm claimed.

Qume's Speedfeed is an add-on device that inserts fresh paper and removes typed documents while under control of the user's system.

The unit sells for $1,390 and OEM quantity discounts are available from the firm at 2323 Industrial Parkway W., Hayward, Calif. 94545.

Finally, a SMART ALEC that everyone needs!

- Communications
- Extended Basic High Level Language
- Keyboard/Printer Separation
- Sophisticated Word Processing
- Exclusive Speller
- Mail List
- Business Application Packages
- All in the Same Easy to Use Equipment
- Smart Alec Gives Your Terminal Equipment These Capabilities
- Or ACS Will Supply a Complete System
- All at an Incredibly Low Price

Smart Alec is looking for sharp, aggressive sales people for major marketing areas.

Smart Alec is just your type

Merged Technologies — Part 3

Use of COM in On-Line System Reduces Cost

By William McCullough
And Frank Malabarba
Special to CW

To address the true cost of an on-line information system, many individual components must be examined and costed out.

In addition, the characteristics of these components adds a degree of difficulty to the costing process: therefore, it is impossible to present a one-line picture of cost.

There are endless varieties of terminals, from Teletypes to intelligent terminals, costing $700 to over $10,000, or $30- to over $300/month. Phone lines costs can be long-distance rates, Wats lines at a flat rate for unlimited usage or dedicated leased lines at the typical rate of .015 cent/day/mile.

Communications controller/processors run from $50 to $30,000/mo or from $2,000 to over $1 million to purchase. Mainframe computers systems capable of on-line operation can cost $2,000- to $50,000/mo to rent or $50,000 to over $30 million to purchase.

Modems, on the other hand, are relatively inexpensive, renting from $8 to $105/mo and costing $135 to $9,000. Operating system and data base management software is supplied free by "unbundled" vendors but others — including independent software houses — charge up to $1,000/mo or up to $69,000 purchase.

Obviously, the cost of servicing even one terminal cannot be derived from figures like these because most components are used to perform a multitude of tasks and because the amount of time they are shared would require microsecond time accounting in order to allocate costs.

Going one step further, the characteristics of the components show there are endless variations in configurations and degrees of sophistication. Most important, however, is the fact that each component in a typical system is dependent upon the other.

This is the last article in a three-part series that looks at the integration of on-line and COM systems. The series was coauthored by Frank Malabarba, a computer specialist for the U.S. Navy at Indian Head, Md., and by William McCullough, national sales manager for U.S. Datacorp, a COM service organization.

If the line is "hit" or a processor goes down, the entire system is affected. The backup components can be added, at extra cost, if priorities dictate, but this simply increases cost a little more.

Although on-line systems are expensive, there are many instances when an on-line system is the only way to go, and even others where almost any cost is justified.

If it is determined that computer output microfilm (COM) can meet the requirements of an information system then the costs, when compared with an on-line system, are much smaller.

It is difficult to make an accurate comparison between the two media without specific facts, such as the file size, update frequency, number of terminals, etc. A few comparisons that may be meaningful are as follows:

- A COM viewer can be purchased for less than one month's lease of an IBM 3270 terminal.
- A COM recorder can be leased for about the same cost as one IBM 3330 disk drive.
- A 500,000-page data base could be produced on COM and kept current on a daily basis for less than $6,000/mo.

The major area to look for possible savings in system planning is to use COM in conjunction with on-line systems as a replacement for mass storage devices.

Before discussing the topic of real-time/current status, it is important to define these terms. "Real time" is the term used to describe the characteristics of a computer system

SYSTEM 2000
Puts your resources to work

Data is a valuable resource. Without proper management, its usage becomes inefficient and impacts the productivity of your other corporate resources.

MRI's SYSTEM 2000 can put your data to work, can make it serve your company in many, many beneficial ways, and can take some of the workload off those other valuable resources.

SYSTEM 2000 is a versatile data base management system designed for users of IBM, CDC, Univac, and Amdahl computers. Working with a wide variety of applications, with data bases ranging from 300,000 to more than 1.5 billion characters, with non-data processing personnel as well as highly-skilled programmers, SYSTEM 2000 provides flexibility and efficiency in even the most complex environment.

To find out how hardworking your resources can be, contact our nearest marketing representative or MRI corporate headquarters. Find out how resourceful and hardworking our people are in ensuring that your needs are met. Ask about the new DOS/VS version and CONTROL 2000, MRI's data dictionary.

Put your resources to work . . .
and take advantage of ours.

Infoton has always produced a special breed of terminals.

Reliability is what has made seven generations of Infoton winners stand out from the field. And, like their predecessors, it's their reliability that makes the new Infoton 200 and 400 so very special.

They are just built better than other terminals in their class.

Take the 200, for example. A detachable keyboard of solid state construction guarantees 100 million operations . . . ten times the performance of most mechanical keyboards. And the keyboard comes in various configurations to suit users' unique requirements.

Other outstanding features include 9 x 9 dot matrix, addressable cursor, EIA and current loop interfaces and non-destructive forward and back spacing.

The 400 has everything the 200 has . . . and more. Designed around the Z-80 microprocessor, it performs a multitude of functions. Capabilities include complete formating and editing with block mode transmission. Also character mode for normal log-in procedures or straight character operation.

Last but not least. Both the 200 and 400 have prices among the lowest in the industry. No wonder they are such favorites.

Write or call for full details.

Two new low price thoroughbred winners

Free Brochures Available

NEWTON, Mass.— Several firms are offering free brochures and promotional material to *Computerworld* readers.

"A Pocket Guide to Source Data Processing," a 22-page illustrated brochure, is available from Entrex, Inc., 168 Middlesex Tnpk., Burlington, Mass. 01803.

A six-page color brochure on Comtal Corp.'s Vision One image-processing system is available from the firm at 169 No. Halstead St., Pasadena, Calif. 91107.

A 24-page brochure describing electrical connectors and backpanel intraconnection systems is available from Eric Krause at Dynatech Corp., 1225 E. Wakeham Ave., Santa Ana, Calif. 92702.

A 20-page handbook containing conversion tables and engineering data used in process control is available from the Foxboro Co., Dept 120, Foxboro, Mass. 02035.

Analogic Corp. has a six-page brochure on the firm's line of modular power supplies. Users can obtain that brochure by contacting Ray Schafer at the firm on Audobon Road, Wakefield, Mass. 01880.

A brochure describing Caelus flexible disks is available from Electronic Memories and Magnetics Corp., 1020 Timothy Drive, San Jose, Calif. 95133.

From the "bottom line" people . . .

Truly decentralized data entry just became practical, economical

. . . and *available!*

Now, without specialized training, regular office personnel can quickly capture data on pages or documents virtually at *the source* . . . at any workstation, in any office.

Two new Scan-Optics OCR systems, the 506 and 515 (8 models in all) give you performance ranging from 30 documents or 3 pages per minute up to 60 documents or 7½ pages per minute. All operate off-line. All handle a variety of OCR fonts and handprint. Designed for use in decentralized installations, each contains a minicomputer, scanner, CRT display/keyboard and data storage.

Optional features include communications capability, line printers and more.

For complete information, write Marketing Manager, or call toll-free 1 (800) 243-8791 • TWX : 710/425-6130

MDS Adds Drum Printer

PARSIPPANY, N.J. — Mohawk Data Sciences Corp. (MDS) has added a 132-column, 900 line/min drum printer for use with its 1200 and 2400 series of data entry/communications systems.

The Model 2442 has a 64-character set with a 96-character set as an option. It has a slewing speed of 30 in./sec and a 20 msec line advance speed.

The printer can accommodate forms with up to six parts; the forms can be from 4- to 16.75-in.-wide, a spokesman noted.

The Model 2442 sells for $30,000 or rents for $930/mo, including maintenance, on a one-year contract, MDS said from 1599 Littleton Road, Parsippany, N.J. 07054.

COM Cuts On-Line User Costs

(Continued from Page 28)

which not only provides on-line access to information, but also allows immediate update and processing of new information. This latter feature is the key to the uniqueness of real-time systems.

When we talk about real time, I think it is safe to say that there are certain functions of an information-processing system that can only be accomplished on-line to a computer.

Now that we have real time in perspective, let's look at the demand for information as it relates to the allowed time to provide that information.

Reservation, banking and inventory system all fall into the 2- to 5 sec response range, and total transaction time may move them into the .1 min range. Even if we go all the way up to the eight-hour point, it is still difficult to produce and distribute any appreciable volume of information within that time, certainly not on paper and in only certain cases via COM.

But let's look at the 80% of information demands that are not needed within eight hours, those that are given overnight or longer. Now we can open the door to COM-produced information which can satisfy most demands.

If we consider that the greater majority of Inquiries into a data base are usually answered using a small portion of the total data available, we can conclude that there is room for improvement in the structure of the on-line data base. Also, considering that some small percentage of inquiries require information from the total data base, what is the best way to improve upon such systems?

If cost is a consideration, then possibly the best way to improve the system would be to purge all data over 24 hours old to a COM file. Using the COM software discussed earlier, the index to the COM file could remain on-line to provide for rapid access to the information in the file. This would not degrade the system in any way.

In addressing the history/-audit trail issue with respect to on-line systems, we have to emphasize the accessibility of information as the key feature. Keeping this in mind, what happens to data that has outlived its useful on-line life and must begin a new life off-line?

In almost every aspect of business today, in one form or another regulations are found that require far more detailed and prolonged recordkeeping than ever before.

When on-line systems design reaches this particular stage, the questions usually faced are: Where do we put this old information and in what format?

The first step is usually to purge the data onto magnetic tape and provide for accessing when the need arises. But let's not forget that "audit trail" is a much more ominous term than "history file." Implicit in the former term is the ability to trace the cumulative results of transactions all the way through a system.

In order to do this on-line, "pointers" are usually provided in the files which send the inquiries either forward or backward through a file to the most current or previous record data. This is necessary because, unlike tape file, disk files are not maintained and updated in the traditional father/son/grandson batch method. So all transactions are usually saved on tape in case files must be reconstructed from some point in time.

Eventually, the string of information which is tied together by pointers grows too long, becomes outdated and is a burden on the data base system itself. It becomes time to purge.

At this point the data can either remain on magnetic tape, be printed out or somehow preserved on microfilm. It is only lately that this latter format has been recognized as the most cost-effective method.

Joining the two technologies together at this point is another of the more versatile examples of the power of COM/micrographics.

If maintenance of an audit trail is a significant requirement of a particular information system, then COM should receive serious consideration.

The COM software to accept computer data, files changes, create indexes and maintain an audit trail on all file activity is readily available from most major COM companies. It is neither difficult to install nor expensive.

In summary, I do not propose COM as a replacement to on-line systems; This isn't possible in most cases. However, if COM is integrated into the planning of information systems, it could result in overall system improvements and, in most cases, a significant reduction in the cost of the system.

After Univac Takeover

VDM Users Adopt Wait-and-See Stand

By Esther Surden
CW Staff

What happens when a large computer manufacturer takes over the assets of the vendor with whom you've been dealing?

Varian Data Machines (VDM) users seem to be taking a wait-and-see attitude.

Univac concluded an agreement on June 16 under which it purchased the assets of VDM. It recently sent a letter to Varian users notifying them of the takeover.

According to the letter, Univac has employed approximately "1,000 VDM people involved in the development, manufacturing, marketing and services of VDM products on a worldwide basis," and plans to expand this staff. Through its established sales and service network, the firm pledged to "offer expanded services, systems support, parts and maintenance."

Several users surveyed by CW believe things have to get better with the change in vendors. They noted that Varian had recently experienced great personnel turnover and was never very strong on support.

A university user who has had a Varian 620F-100 for a little over four years and is using the system for data acquisition said "I don't imagine [support] will be any worse under Univac." The system is being used in the chemistry department at Memphis State University.

The department had performed its own maintenance and had had very little contact with the Varian people over the years, according to Dr. J.C. Williams, associate professor of chemistry. What little contact there was with Varian was marked by a "big personnel turnover," forcing the department to go through a long list of people in order to contact the right person.

Switch 'No Surprise'

Another user, Dr. Charles Klopfenstein, director of laboratories at Oregon University, said he knew for a long time that the switch from Varian to Univac was in the works so "it wasn't a surprise.

"Things can't be any worse than they were," Klopfenstein said. The laboratories have 18 Varian machines of different models and the university has developed its own hardware and software support capability for the system. "The only time we interacted with Varian was when we called up to order a computer," he noted.

With Univac the supplier, "there is a possibility that this could change," he said.

Another educational user of a single Varian V72 system noted that service and support from the vendor "has got to get better; it can't get any worse. It's been obvious they've been dealing from a situation of crisis for some time."

Because service will be taken care of by the same people who service Univac's systems, responsiveness to complaints and calls for maintenance should improve, according to the user, Dr. Anthony Q. Baxter, assistant professor at the University of Kentucky.

"We have old 620 Ls which are practically obsolete so the switch to Univac has made absolutely no difference to us," according to Robert E. Lee, software specialist for the City of South Bend, Ind.

The city uses the minis as communications front-end interfaces, he noted, and they are "rock solid."

The city has a monthly maintenance contract, Lee said, the system's maintenance is taken care of from the Detroit office. Varian flies in a maintenance engineer and the same person who had been taking care of the minis has continued to do so, he added.

Mini Bits

DEC Drops Prices For Tape Drives

MAYNARD, Mass. — Digital Equipment Corp. reduced prices from 13% to 22% for its TJU45 and TWU45 nine-track magnetic tape subsystems for PDP-11 computers, a spokesman said.

The master tape drive including controller, designated TWU45 for PDP-11/70 computers and TJU45 for other PDP-11s, has been reduced in price from $26,500 to $23,000. Additional drives are available for $14,000.

A two-drive package is also being offered for PDP-11/70 computers, consisting of one TWU45 master drive and one TU45 slave unit. The package is priced at $31,500, a 22% reduction from the previous figure for the same configuration, DEC noted from Maynard, Mass. 01754.

Ampex Add-In Fits Novas

EL SEGUNDO, Calif. — Ampex Corp.'s ARM-3 is a 32K-byte add-in memory said to be transparent and pin-compatible with Data General Corp. Nova 3 minicomputers.

The unit offers 800-nsec full-cycle operation in 16K-word modules.

The 16K module is said to operate in any address field and no modifications are required to either hardware or software to use the unit with the Nova 3. It costs $1,725, Ampex said from 200 N. Nash St., El Segundo, Calif. 90245.

Tester Diagnoses Buses

WOODLAND HILLS, Calif. — A test device designed to tell users of Digital Equipment Corp. PDP-11 minicomputers if they have broken wires in the Unibus is available from Datafusion Corp.

Called the OST11 Bustester, the unit is a portable device for "continuity testing of 72-line Unibus cable," a spokesman noted.

An LED display indicates shortened or intermittent wires.

The OST11 Bustester costs $295 from the company at 21031 Ventura Blvd., Woodland Hills, Calif. 91364.

Importer's Mini Tracks Shipments

LOS ANGELES — When one small business system couldn't fill its needs, Laube Corp. turned to another with much success, according to Walter Ising, president of the firm.

The company, a world-wid importer and distributor of steel products and electronic components, used to keep track of shipments throughout the world on an enormous blackboard spanning an entire office wall.

The names of the ships carrying the cargo, identification numbers and logs of merchandise were updated on the board by three employees.

The firm began to computerize with a Singer Business Machines System 10 small business system which, Ising said, "never functioned." When Singer went out of business "we were lucky because we hadn't paid them anything."

The firm then decided to try a different approach. It looked into several systems and decided that one from General Automation was "compact enough and simple enough" to use in its operation.

The firm contracted with California Data Management, Inc. (Cal Data) to design and implement an in-transit inventory tracking, order entry, purchasing and accounting system. Cal Data was chosen because it was located in the same building as Laube and could write a special program designed for the firm's needs. "It was very familiar with our type of business," Ising added.

The General Automation DM 130/2 data management inventory/accounting system used at Laube includes the GA SPC-16 mini with 32K words of memory, 10M bytes of disk, a 165 char./-sec printer and two CRT terminals. Although most of the programs are up and running on the system, some still must be modified or corrected.

A minor change is being made in the critical tracking application to allow it to accommodate more than one shipment per order. That application should be running shortly, he noted.

"We used large portions of standard General Automation packaged software and modified it to fit Laube's application," Cal Data president Malcolm Sherman said.

"The system had to take several variables into consideration. Laube wanted to eliminate manual errors, retrieve inventory information, establish an order tracking system and provide service to customers regarding the status of their orders," Sherman explained.

Because much of Laube's business is conducted with Japan, the system had to handle both dollars and yen and had to deal with English and metric measure-

(Continued on Page 32)

1.8M Bytes of Memory Available on HP 21MX

CUPERTINO, Calif. — Hewlett-Packard has increased the amount of memory that can be used with its 21MX and HP 1000 series systems to 1.8M bytes.

The expansion has been made possible through the introduction of a high-density memory module containing 128K bytes of semiconductor fault-control memory and the addition of an optional memory extender.

The memory module uses 16K-bit n-channel random-access memory chips, HP said.

The increased memory allows the system to be used in applications in which high speed and maximum throughput are important and a disk memory is not suitable, the firm explained.

The memory module with fault control can be used by any HP 21MX system in the K, M or E series and any 21MX with a dynamic mapping system can be filed-upgraded without changes to existing software, HP noted.

The 128K-byte memory costs $6,400; the fault-control memory controller costs $600 and associated check bit boards cost $2,750 for blocks of memory up to 256K bytes or $5,000 for blocks of memory up to 512K bytes.

A 12-1/4-in. high E-series with 1M bytes of the high-density fault-control memory costs $59,800; with an extender including 768K bytes the system has a total of 1.8M bytes of memory and costs $109,450. HP is at 1501 Page Mill Road, Palo Alto, Calif. 94304.

Small Businesses Advised to Use DP Resources

FORT LAUDERDALE, Fla. — Small businessmen who avoid using modern technology may face rough roads ahead, B. Joseph Vincent, managing director of Oz International, said here recently.

Sharper competition coupled with increased operating expenses and tighter profit margins are having a stronger effect on the profitability of small businesses today, Vincent said.

Believing small businessmen should begin to take advantage of the benefits modern technology can provide to improve operation, Vincent acknowledged that in the past many small businesses did not take advantage of those benefits for a very important reason — cost.

However, the increased importance of opportunity costs, cash flow and inventory control on the overall profitability of small businesses have served to reduce the costs of computer-type technology.

"Properly utilized, this technology can help reduce overall operating costs and increase profit margins," Vincent said, "by allowing the entrepreneur to make decisions based on more reliable information.

"A prime example of the need for more accurate inventory control is the restaurant business.

"For example, if a restaurant orders 10 cases of lettuce on Monday for a featured salad bar week and the customers choose different menu selections during the first part of the week, the lettuce goes bad, money is lost and profit margins get slimmer.

"If the manager had an up-to-date information system to use in deciding his ordering schedule, rather than seat-of-the-pants reckoning, much of the waste could have been avoided."

If a businessman can't afford his own computer, he may be able to share a computer someone else is using already. There are companies that specialize in selling and maintaining time-sharing programs.

"Another possibility is the commercial banks that handle their daily banking business.

"If this isn't possible, businessmen could try schools that offer computer courses like universities and technical facilities. Often, they will let you rent time from them and provide expert help in designing programs and solving problems," he noted.

Mini Tracks Shipments

(Continued from Page 31)

ments. Also, the system had a number of logical devices installed to check errors.

"Basically, the most important function of the computer is to provide all order information at the tip of our fingers and give us the status of orders we have placed for our customers at any time," Ising said.

There is usually a long lead time, sometimes five months or longer, from the time of purchase to the time the merchandise is received. The system keeps track of the cargo as it progresses on its journey to the buyer in terms of the buyer's order to Laube and Laube's order to its suppliers.

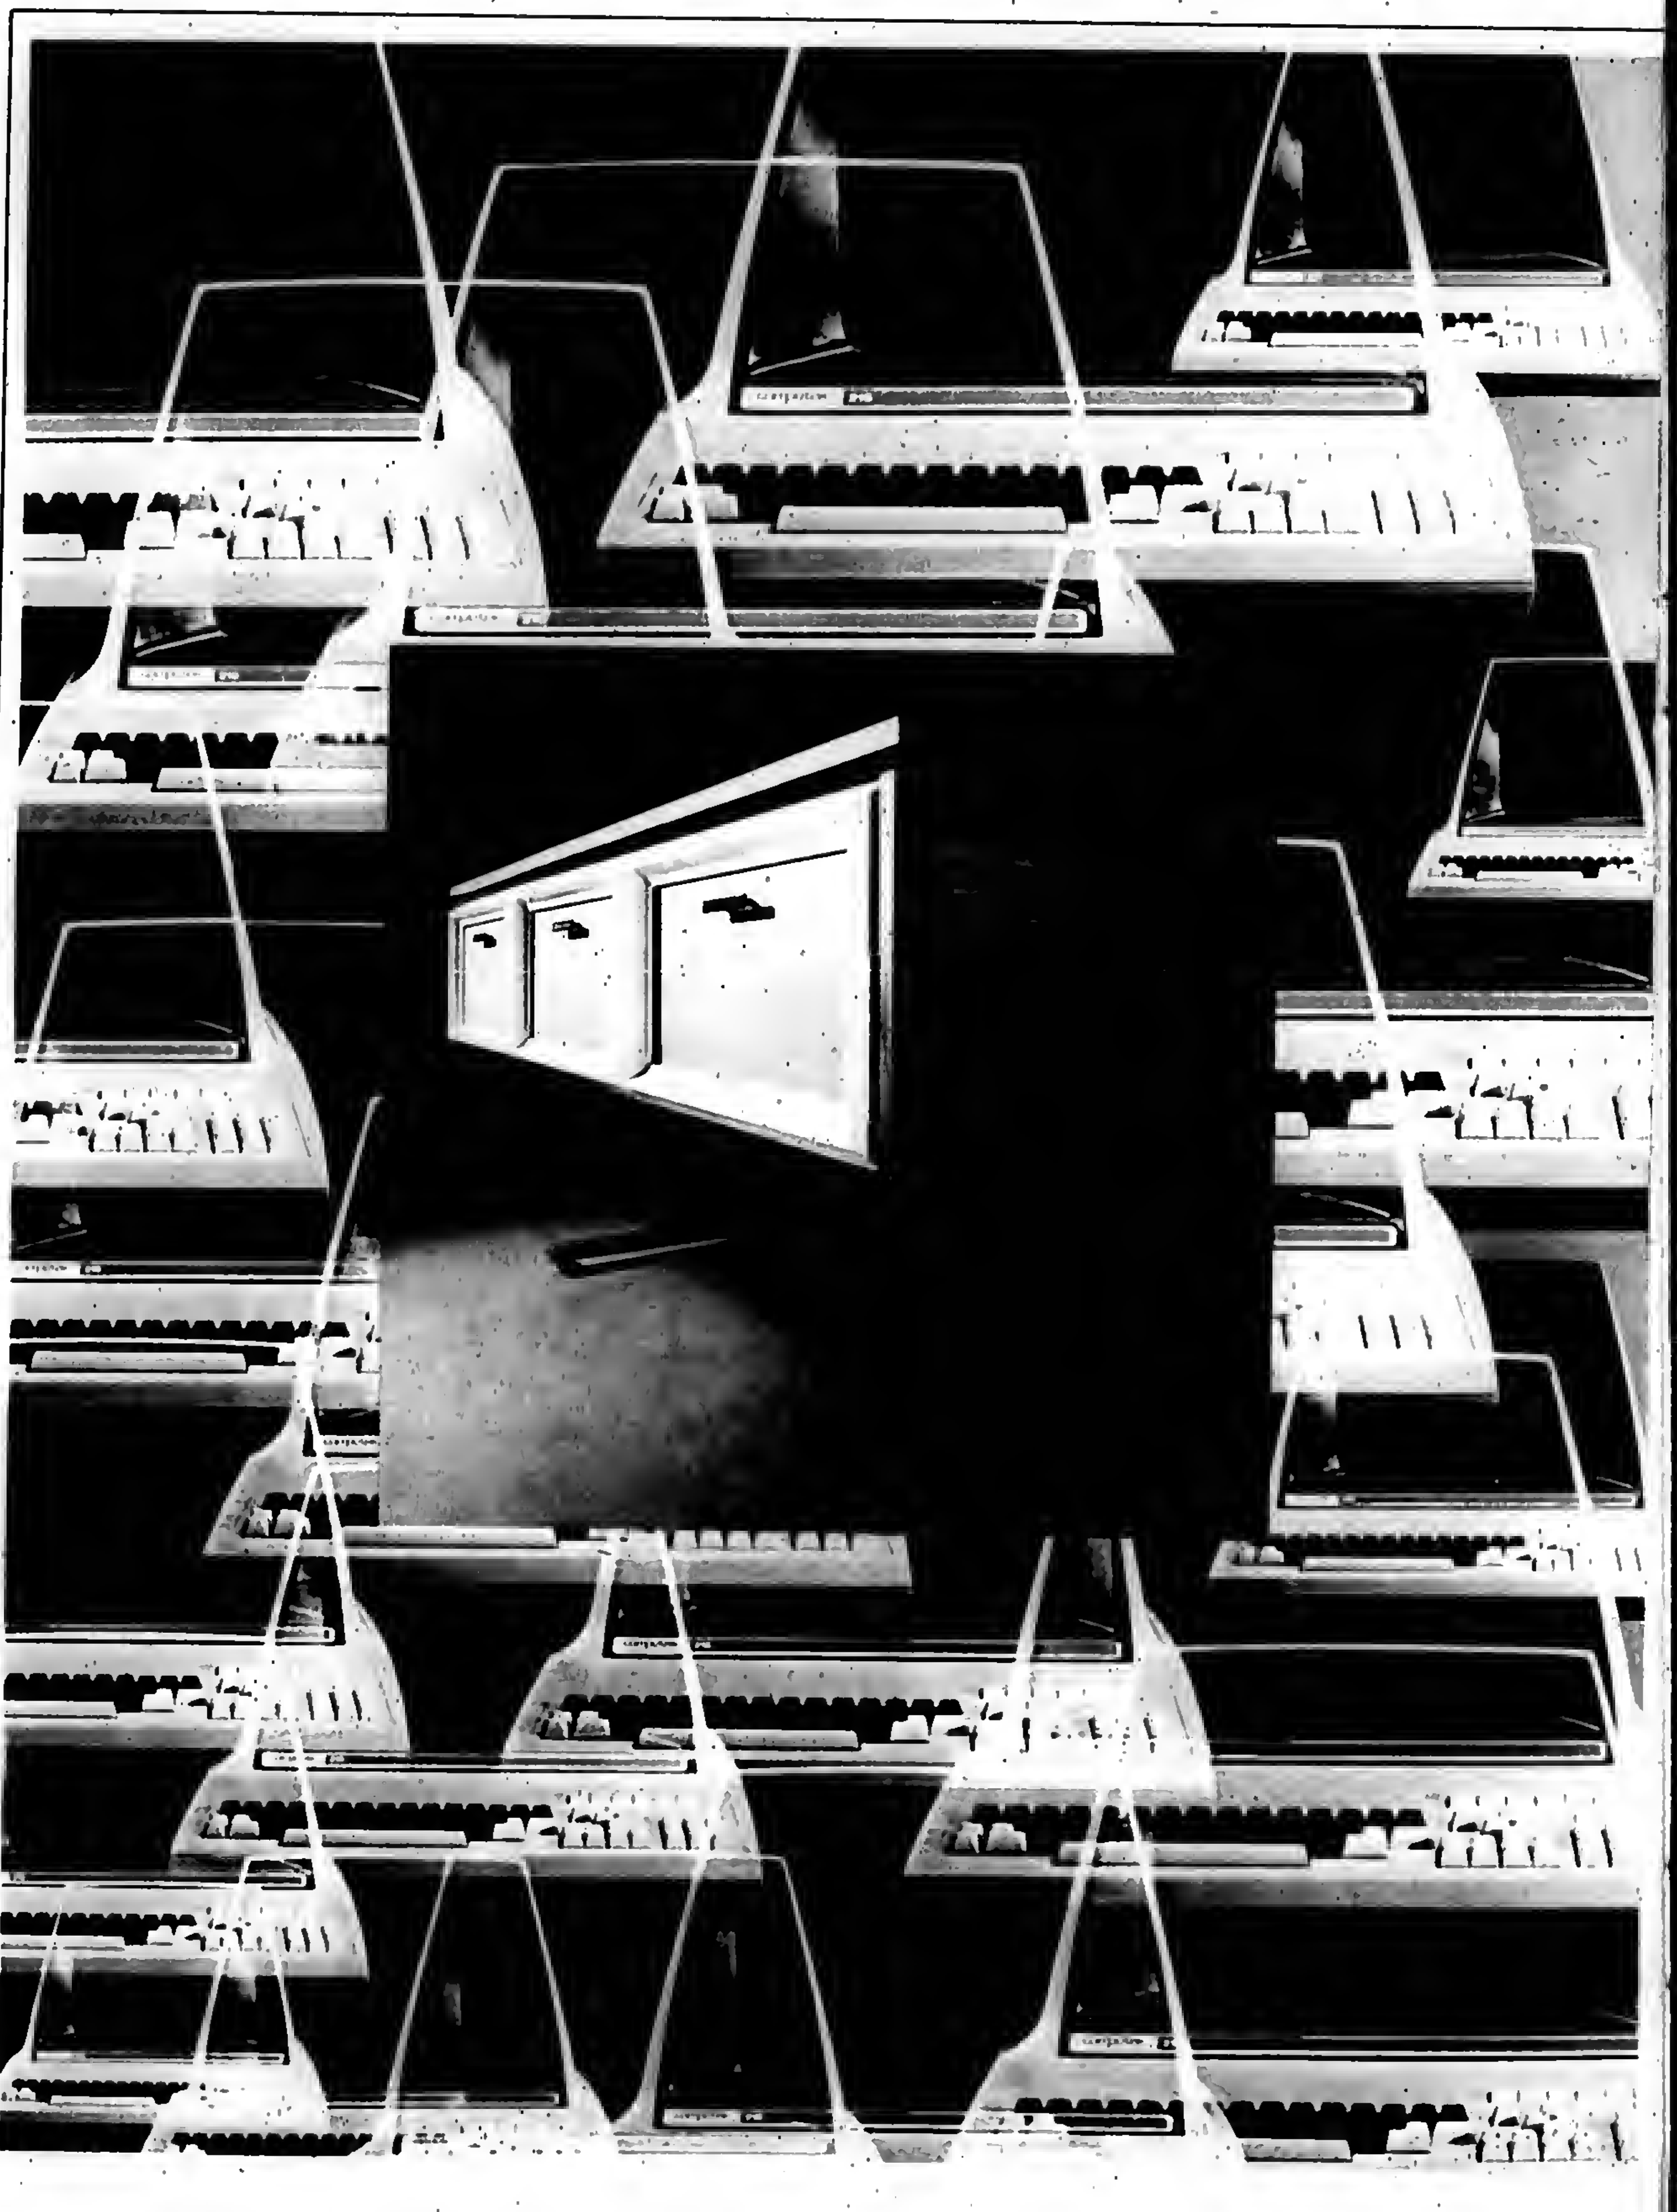
Supervisory Computer

The majority of activity at Laube is generated from its Los Angeles office. From this location, manufacturing representative needs, ordering, distribution and inventory control are controlled by a mainframe supervisory computer.

In addition, the system here handles accounts payable, general ledger and accounts receivable. The sales department accesses the computer daily to retrieve any sales information.

One operator and two trained backup operators work on the system, Ising noted. Maintenance is handled through a General Automation service contract and has been very good, he added, with the firm never having to wait more than two hours for service.

"I would like to see more business from the system," Ising said. "It has the potential of producing more business by reducing possible cancellations and keeping better track of orders," he explained.



Manual Invoicing 'Too Error-Prone'

Mini Helps Firm Tackle Growing Client Base

MEMPHIS, Tenn. — The installation of a small business system has helped Steelcraft Corp. here cope with a swelling customer base and the resulting paperwork blizzard, according to assistant treasurer D.A. Drewes.

The company manufactures pneumatic dust-handling systems for the woodworking, grain and paper industries and also produces motor bases and angle rings.

"As the customer base grew to well over 1,000, paperwork also grew. With assorted price lists, the hand invoicing became too error-prone and the hand posting too laborious to tolerate," he explained.

To remedy the situation, the Wang Laboratories, Inc. 2200 minicomputer was selected in May of 1974 and program installation began that August.

Since acquisition of the minicomputer, the firm has installed a receivable, payable and payroll system, which includes product line and salesmen's sales analyses as side benefits of the invoicing programs.

In addition, the invoice files are scanned for specific product sales to provide production control and, together with the necessary sales data, reports are produced that forecast future needs. From the master customer files also come monthly statements and collection letters.

After the basic systems were operational, the company added several applications. Initial applications were programmed by the software dealer, but Drewes did the rest himself.

Asset and depreciation listings were computerized and annual depreciation charges were calculated. This eliminated burdensome lap schedules. In addition, shop equipment maintenance records were stored on disk and maintenance requests were automatically generated at the proper intervals.

Mailing list programs were also written which could access either the customer master file or purchased lists and then output the proper letter. Price and weight sheets of various standard manufactured items were kept up-to-date and provided to sales personnel as required. Time cards were printed from payroll records, along with lists by seniority and birthdate as well as lists required for various pension and profit-sharing plans. The firm also designed programs which provide sales and sales tax by state for required government tax reports.

Currently two systems to aid the manufacturing division are under development. The first is for use with recently purchased numerically controlled punch and cutting equipment. The program generates the necessary coordinates to cut flat patterns for elbow gores.

This is a mathematical program utilizing trigonometric functions and layout procedures developed over the years for sheet metal products.

Order Control Program

The other system under way will aid in order control, production and erection scheduling. The first portion consists of a field erection schedule, which divides the job into various systems required and traces the progress from original scheduled performance through actual costs of erection. It also tracks the ahead or behind condition through field analyses of percentages of completion.

If more than one system is tied together for erection purposes, the schedule will adjust to this situation as progress is charted. The total schedule will provide quick data on whether the target completion will be met or will indicate that steps must be taken to correct the situation.

The program involved will handle any job with 40 or fewer divisions. Actually, the number 40 is controlled by the 132-column print capability of the high-speed printer, since each division requires three columns plus room on the left of the form for date information.

Count on GA for big COBOL performance in multi-terminal applications.

And count on the lowest cost per terminal. Available now, General Automation's new 440 Data Series, starting below $45,000, recognized for the best price/performance package in the computer field: "...It always works...far superior to any other full systems less than $80,000. Any comparable system will cost over $175,000."*

1. **The most powerful ANSI COBOL**—years ahead of any other tested. Compiles 3-to-10 times faster than a 370/145.
2. **Store 160 megabytes; 1 second response.** Support 16 terminals with less than 1 sec response; 128 KB main memory. Store up to 160 megabytes on disk, with the 720ns GA 440 minicomputer.
3. **Concurrent batch and on-line processing.** With shared data-base protection: maximum multi-terminal access with minimum user-contention, all operating in our field-proven File Management System.
4. **GA 440: fully field-proven and GA-serviced,** in more than 500 installations around the world to date.
5. **Exhaustive system-testing:** over 400 different combinations rigorously tested for response time.

Count on GA for all your distributed processing systems — from a basic 2-terminal system to a 10,000-terminal network; from factory and business data collection to corporate networking systems — through our advanced line of high-technology mini and microcomputers. You'll be joining the world's largest corporations who now count on GA for the most productive system solutions: in financial, industrial and telecommunications applications.

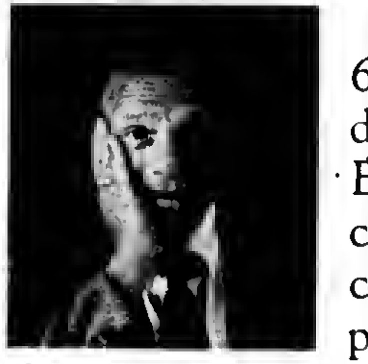
THE DATAPOINT 6600--

Datapoint 6600 Computer with 20-megabyte disk drive

For Network Planners It's a Disturbing System



"The Datapoint 6600 is indeed a disturbing system. Because it will change the way computer network planners now think about "small" computer systems.

True, the 6600 is small physically, like the Datapoint computers that have come before it. But it is equipped with the latest technology, including features like 120K user memory, and can support up to 24 independently-functioning video display terminals in a true timesharing mode. In fact, the Datapoint 6600 packs the processing wallop of many of today's large-scale computers, at a fraction of their cost.

When combined with Datapoint's wide range of peripheral equipment, such as the new 20-megabyte disk drive, the 6600 can be used to produce a variety of disturbingly capable systems. It will free network designers from many of the constraints that previously bound them. With the 6600, regional centers can remove a major processing burden from the central mainframe computer while boosting the efficiency of local operations. In fact, a well-planned dispersed processing network can in many cases eliminate "mainframe inflation" altogether.

Like other Datapoint dispersed processors, the 6600 functions well in a stand-alone mode. It has the speed and power to handle 24 different user programs simultaneously, or to run batch jobs in COBOL, BASIC and RPG II. And with communications capabilities always available, a stand-alone 6600 can be converted almost instantly into a functioning node in a dispersed processing network.

In truth, the 6600 is a disturbing system because it will challenge your present assumptions about what a small computer can do for your operation.

Accept the challenge. Study the Datapoint 6600 in detail. Compare it with the competition. Look at the carefully planned sequence of compatible Datapoint hardware and software products which have preceded it. We think you'll come to the conclusion that the 6600 has more to offer than any comparable system now on the market.

For more information on the 6600, contact the Datapoint sales office nearest you, or write Datapoint Corporation, attention: Product Marketing, 9725 Datapoint Drive, San Antonio, Texas 78284

Sales and service offices in principal cities

Micro Bytes

Real-Time Warfare Game In 8080 Assembly Code

TALLAHASSEE, Fla. — Objective Design, Inc. has a real-time warfare game written in 8080 Assembly language.

"Encounter" allows each player to attack and defend as many places on the field as the player is able to mentally maintain. The play is continuous, according to a spokesman.

Hardware requirements include an 8080 or Z80 processor, 4K bytes of random-access memory, two interfaced Ascii keyboards and a CRT terminal.

With complete rules and source code, the game costs $16.95 on paper tape and $19.95 on tarbell tape from the firm at P.O. Box 20315, Tallahassee, Fla. 32304.

Mikados Gets Disassembler

VAN NUYS, Calif. — Inpro Micro Systems has enhanced its Mini Instant Keyboard Assembler, Debug and Operating System (Mikados) to include a complete disassembler.

With the enhancement, Mikados occupies 3K bytes of memory. The $17.95 price includes a 28-page user's manual and hex object code listings plus a limited 90-day warranty.

California residents must add 6% sales tax, the firm noted. It can be reached through P.O. Box 7776, Van Nuys, Calif. 91409.

Booklet Explains Buzzwords

TEMPE, Ariz. — Byte Shops of Arizona has a catalog of microcomputer systems, peripherals and lexicon.

The "Byte Shopper" serves as an introductory text to personal computing, providing explanations of buzzwords and descriptions of how microcomputers work and where they can be useful.

The guide integrates manufacturer's specifications with a discussion of how each product can be used and how it relates to an overall computing system. Typical systems are pictured and discussed in detail.

"Byte Shopper" is available for $2 from P.O. Box 28106, Tempe, Ariz. 85282.

German Hobbyists Share Notes

KELKHEIM/TAUNUS, W. Germany — A German computer hobby club has been started under the auspices of CMIX GmbH, which is making available components for assembly of a CMIX 8080 minicomputer.

The club is willing to give others advice on how to start a similar venture.

Further information is available from Martin Jetter, Mozartstrasse 13, D6233 Kelkheim/Taunus, W. Germany.

Kim-1 Housing Offered

SAN FRANCISCO — The Enclosures Group here has developed a housing for the Kim-1 microcomputer.

The housing is manufactured from high-impact thermoformed plastic and is available in a variety of colors.

It costs $23.50 from the firm at 55 Stevenson St., San Francisco, Calif. 94105.

Altair 8800 Gets Power

ALBANY, Calif.— Parasitic Engineering has a constant voltage power supply designed for Altair 8800 microcomputers.

The unit can replace the three standard 8800 transformers, according to a spokesman.

The power supply kit costs $90 postpaid from Parasitic at P.O. Box 6314, Albany, Calif. 94706.

Micros Can Be Defined By Genesis, Orientation

By Dr. Adam Osborne
Special to CW

Microprocessors are likely to have a larger impact on DP then many people realize. Today's popular microprocessors all have DP origins.

It is not well-known, but the Datapoint 2200 CPU is the grandfather of today's microprocessors. The 2200's instruction set is equivalent to a very primitive microprocessor, the Intel 8008; however, the 2200 executes instructions 10 times faster than the 8008.

Since Datapoint CPUs have made great inroads into DP applications, this should be enough of an indicator for future microcomputer possibilities.

Fit Two Categories

We can divide microprocessors broadly into those which are ancestors of the Datapoint 2200 — and are well-suited to DP applications — and those which have been designed specifically for digital logic applications. The principal differences between these two sets of microprocessors may be summarized as follows:

- Instruction sets of the DP-oriented microcomputers are adequate for DP applications. Digital logic-oriented microprocessors, on the other hand, tend to have very primitive instruction sets with many key capabilities absent.
- DP-oriented micro can easily be expanded with various support devices to handle peripheral devices such as CRTs, disk units and printers. Digital logic-oriented micros have I/O capabilities that are better suited to creating and processing logic signals.

Microcomputers that can be classified as DP-oriented include the Intel 8080A, the Zilog Z80, the Motorola MC6800, the MOS Technology MCS6500, the Signetics 2650, the Texas Instruments TMS9900 and the Fairchild 9440. These are all 8-bit microprocessors with the exception of the TMS9900 and the Fairchild 9440, which are 16-bit microprocessors.

The Fairchild 9440 has an instruction set which is identical to the Data General Nova 1200 minicomputer. The Intel 8080A, the Zilog Z80, the Motorola MC6800 and the MOS Technology MCS6500 are all descendents of the Datapoint 2200.

The Digital Equipment Corp. PDP-8/E minicomputer is also available as a single chip microprocessor — the Intersil IM6100.

Digital logic-oriented microprocessors include the Fairchild F8, the RCA Cosmac, the Intel 8048, the National Semiconductor SC/MP, the Scientific Microsystems SMS300 and the Texas Instruments TMS1000.

The Intel 8085 is an enhancement of the 8080A, aimed at making the microprocessor suitable for digital logic applications as well as DP applications. The Zilog Z80 is also an enhancement of the 8080A, but the enhancements were aimed almost exclusively at making the microprocessor more attractive in DP applications.

The principal difference between DP-oriented microprocessors and digital logic-oriented microprocessors lies in the design of the large-scale integration (LSI) devices that constitute the microprocessors. DP-oriented units use a considerable amount of logic to implement a realistic instruction set; they pay the price of requiring many additional support devices before a usable microcomputer is obtained.

Digital logic-oriented devices, on the other

Set for Aug. 27-28

Atlantic City to Be Scene of Fair

By Frank Vaughan
CW Staff

ATLANTIC CITY — The Personal Computing '77 (PC '77) Consumer Trade will kick off here Aug. 27 following a week of preconvention activities.

Dr. and Mrs. John Mauchley, both of whom worked on Eniac, the first electronic digital computer, will be featured guests and speakers at the two-day fair.

Over 100 exhibitors are expected to attend the show, according to John H. Dilks, PC '77 director. Heath Co. has chosen the trade fair to make the first public exhibition of its line of computer kits, he noted.

In addition, Cromemco will announce its floppy disk sytsem and RCA will introduce a programmable video graphics machine and its own interpretive language geared toward graphic displays, he said.

Part of this year's PC '77 will include free seminars, forums and technical talks. Subjects will include Eniac, telecommunications, microprocessor design, robots, interfacing, the human factor, music, the handicapped, applications and debugging, Dilks said.

A Personal Computing College consisting of four groupings will be held during the week preceding PC '77.

Dr. Adam Osborne of Osborne and Associates, Inc. will present "Microprocessors — Where They Came From and Where They Are Going," an analysis of products on the market today.

The Aug. 26 and 27 seminar will last six hours and cover a variety of subjects. Information and reservations are available through Osborne and Associates, Dept. PC '77, P.O. Box 2036, Berkeley, Calif. 94702. The telephone number is (415) 548-2805.

Tychon, Inc. will present a three-day "Microcomputer Interfacing Workshop" to provide hands-on interface experience for participants. Reservations can be made with the firm at Dept. PC '77, P.O. Box 2203, S. Hackensack, N.J. 07606.

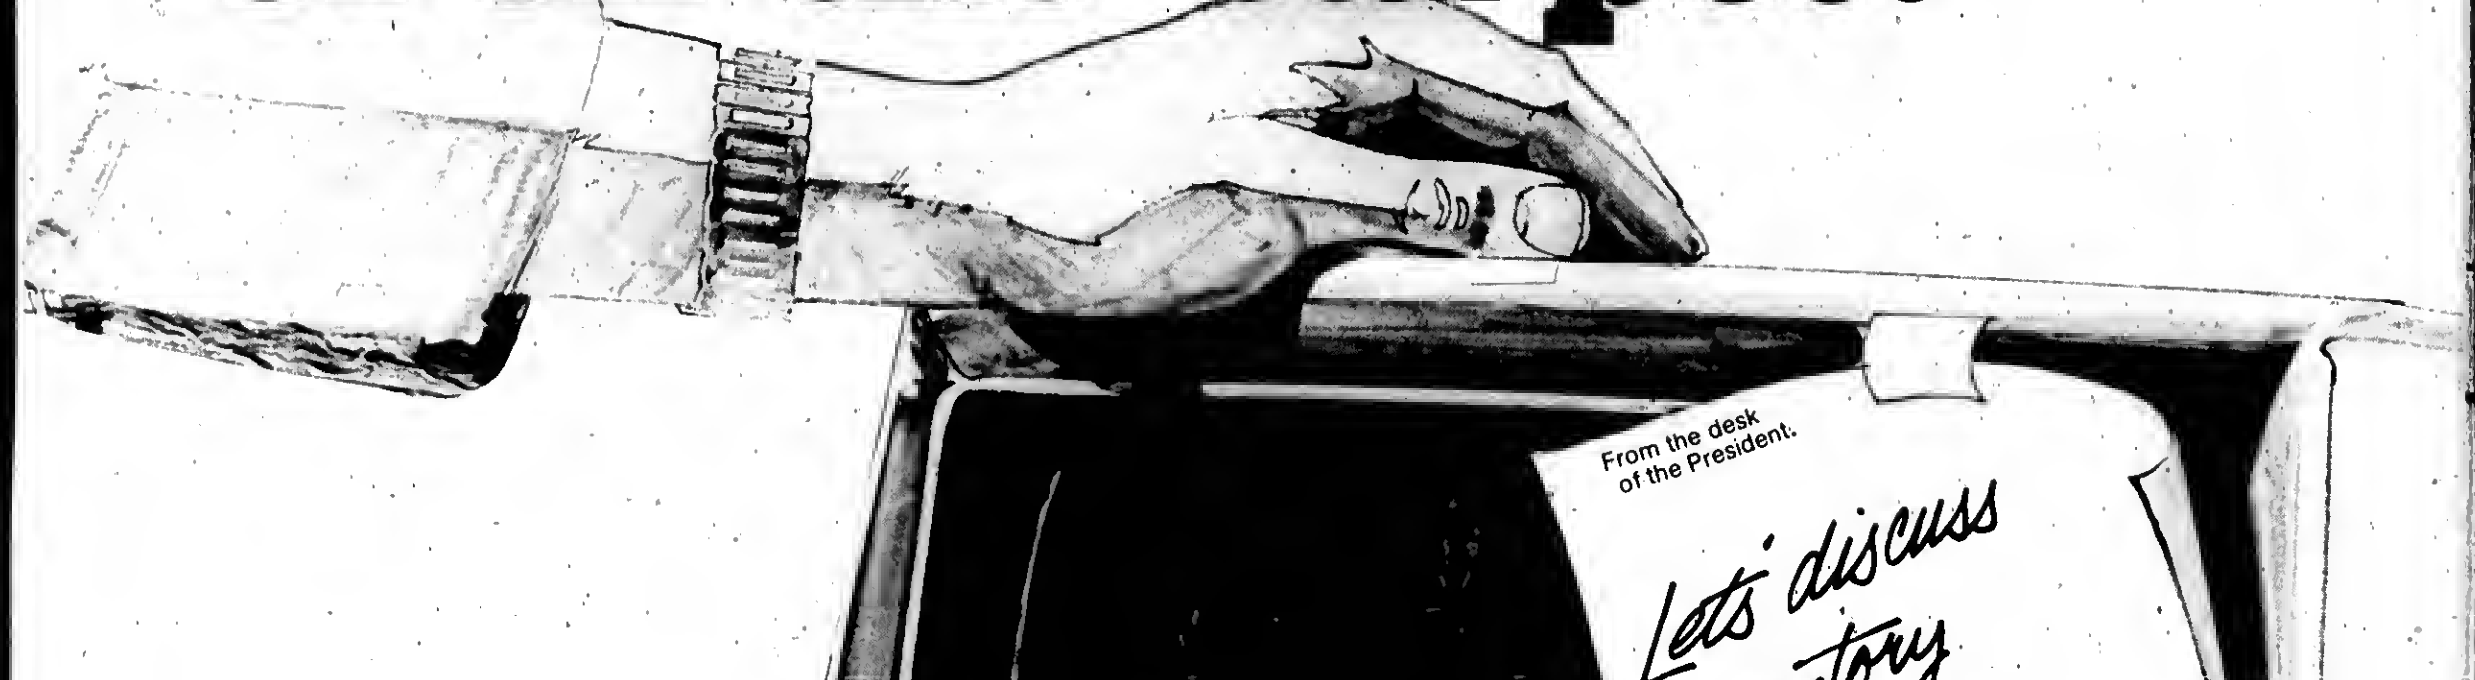
Sybex, Inc. will present "An Introduction to Microprocessors" on Aug. 25 and 28. It will include information on basic definitions, system components, what to look for, impact and evaluation.

On Aug. 26, the firm will present "Microprocessor Applications," which will detail the main application techniques of microprocessors. Information and reservations can be obtained from the firm at 2161 Shattuck Ave., Berkeley, Calif. 90704. The telephone number is (415) 848-8233.

Technical Design Labs and Trenton State College will combine forces to produce a series of Z80 seminars. The Aug. 22-26 seminars will cover programming in Basic, Assembly language programming, Fortran IV, word processing, introduction to hobby computing, digital logic circuits, how to set up a computer store and a kit building lab. Information and reservations are available from Z-80 Seminars, Trenton State College, Trenton, N.J.

Additional PC '77 information is available by contacting the show at Rt. 1, Box 242, Mays Landing, N.J. 08330.

To the VP of manufacturing who'd rather be on-line instead of on-the-carpet:



From the desk
of the President.
Let's discuss
inventory
variances
Tomorrow
8:30 AM
K.F.

An on-line inventory management system is a nice thing to have when you need answers in a hurry. Especially if the system gives you the controls you need to make sure the answers are not full of surprises.

To our V.P. of manufacturing, such a system is more than a nice idea; it's absolutely essential. By being on-line to an interactive, multiuser Prime computer programmed to handle Prime's specific needs, he has everything under control. Last year, for example, the system helped his organization control the variance between physical and book-value inventory to less than 0.1%!

So if you've been spending too much time on the carpet explaining variances more like 5%, a Prime computer can help you control your inventory as tightly as our V.P. controls ours. In fact, the money you'll save by reducing your variance will no doubt pay for the complete system.

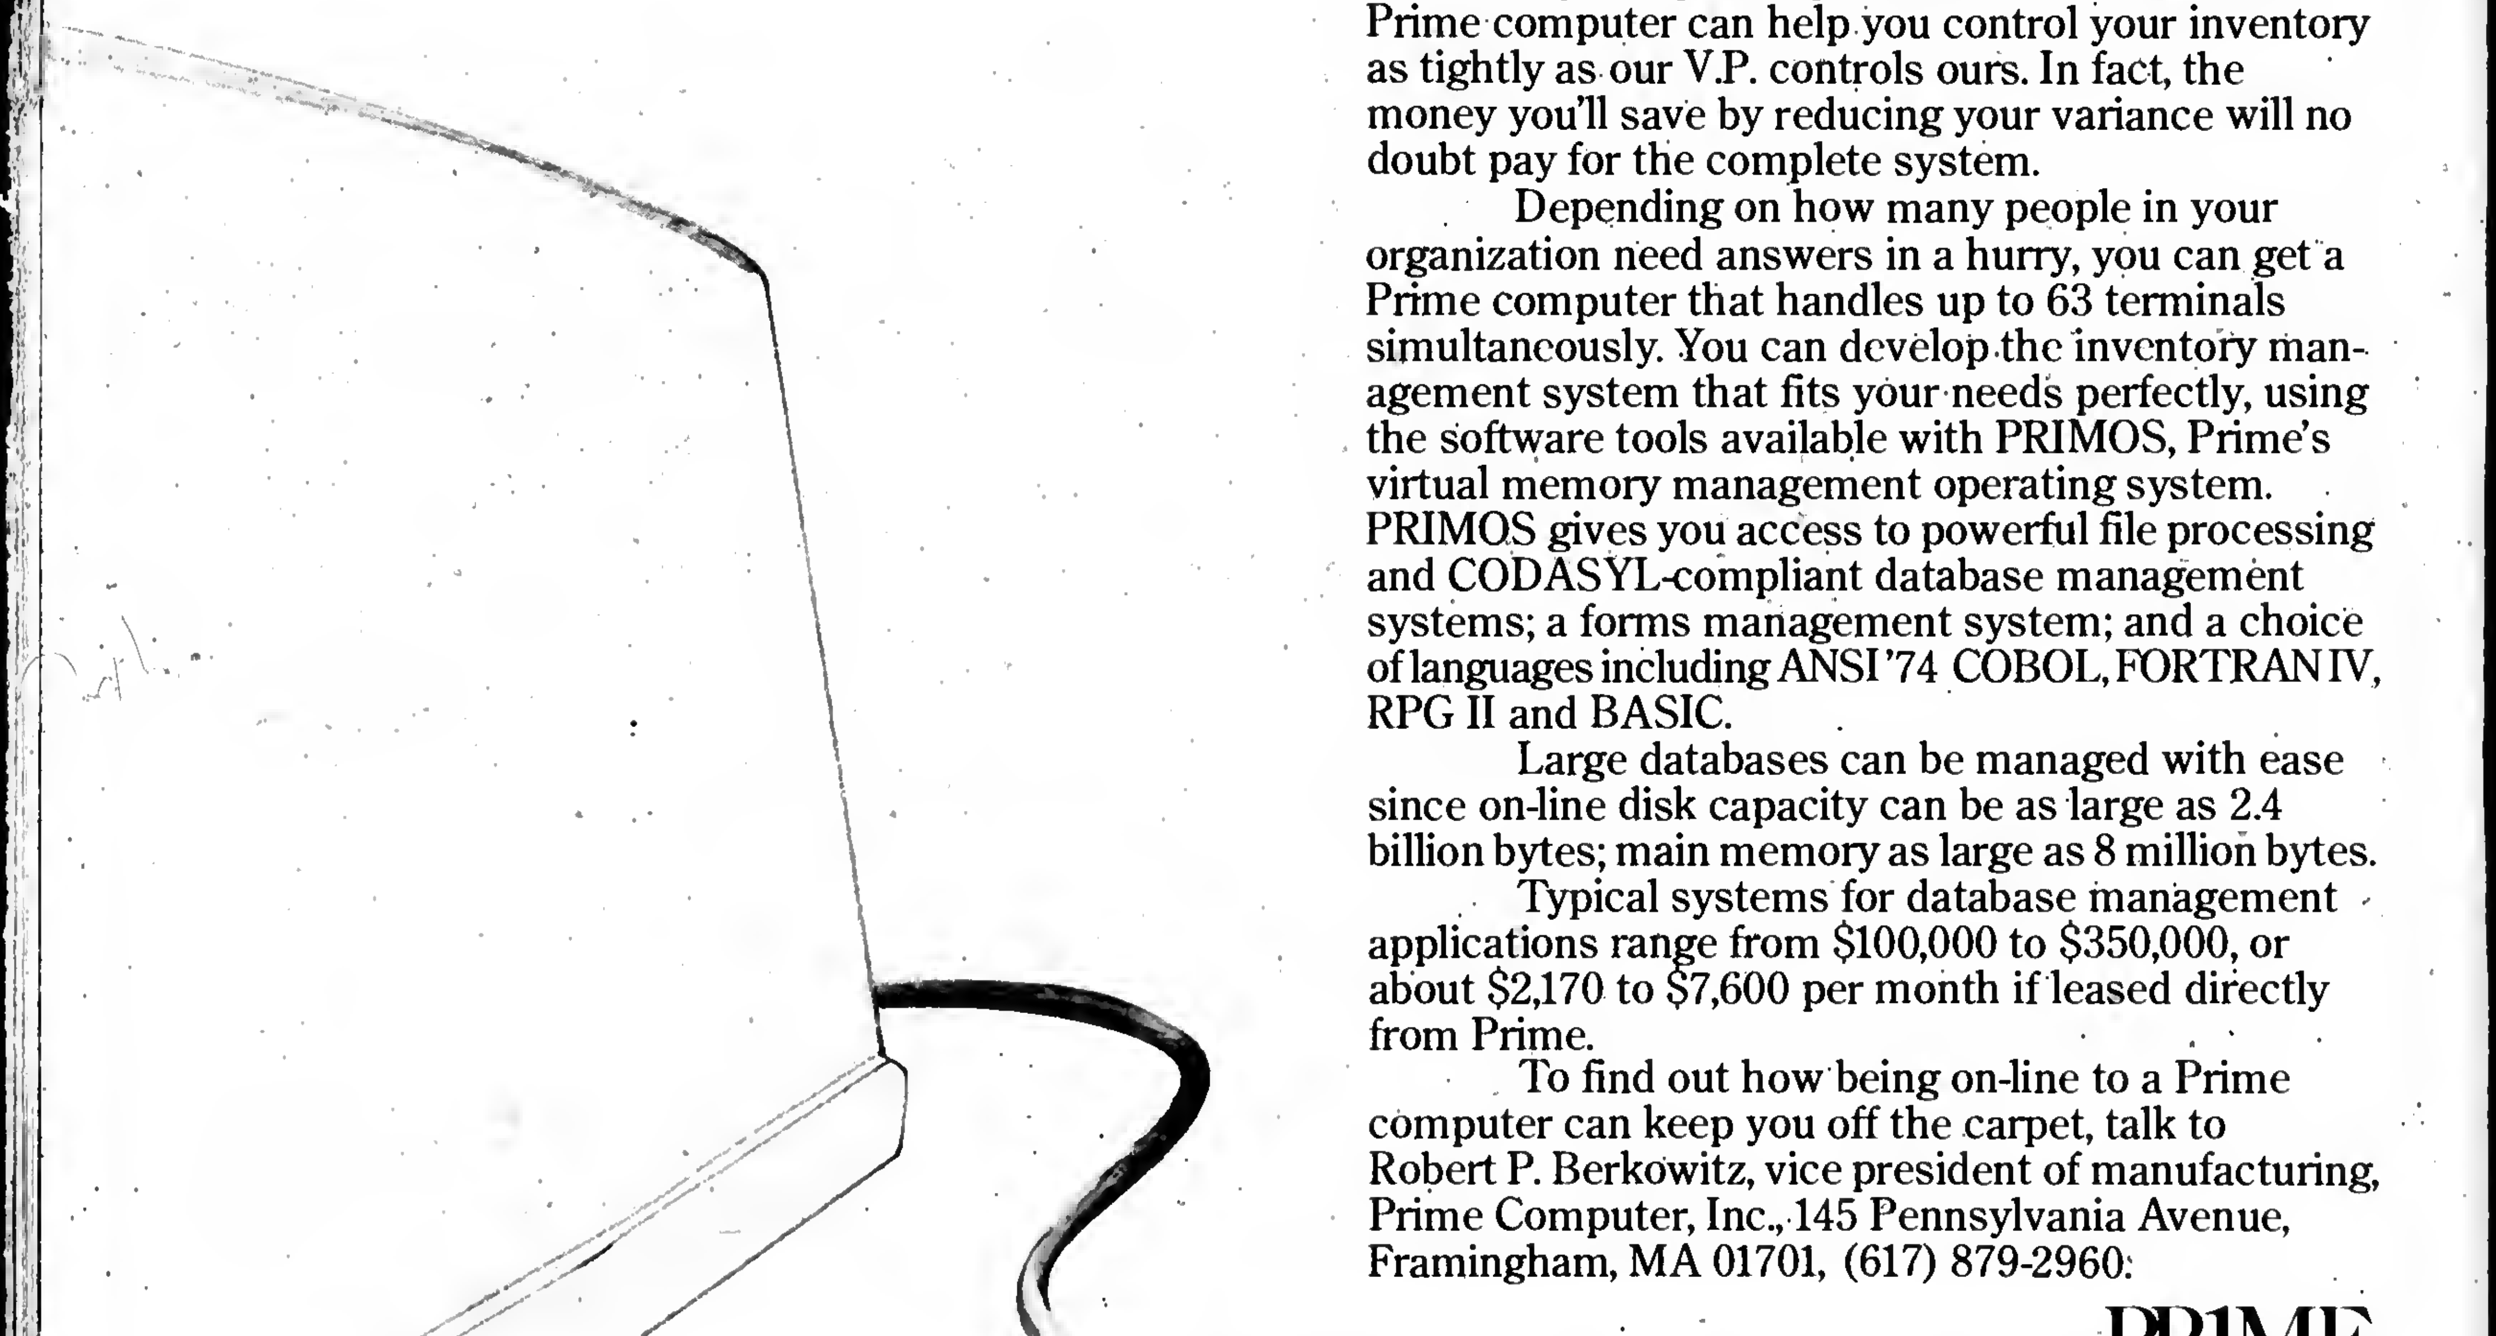
Depending on how many people in your organization need answers in a hurry, you can get a Prime computer that handles up to 63 terminals simultaneously. You can develop the inventory management system that fits your needs perfectly, using the software tools available with PRIMOS, Prime's virtual memory management operating system. PRIMOS gives you access to powerful file processing and CODASYL-compliant database management systems; a forms management system; and a choice of languages including ANSI '74 COBOL, FORTRAN IV, RPG II and BASIC.

Large databases can be managed with ease since on-line disk capacity can be as large as 2.4 billion bytes; main memory as large as 8 million bytes.

Typical systems for database management applications range from $100,000 to $350,000, or about $2,170 to $7,600 per month if leased directly from Prime.

To find out how being on-line to a Prime computer can keep you off the carpet, talk to Robert P. Berkowitz, vice president of manufacturing, Prime Computer, Inc., 145 Pennsylvania Avenue, Framingham, MA 01701, (617) 879-2960.

PRIME



Prime can help

Datapoint 2200 'Grandfather' of Microcomputers

(Continued from Page 35)

hand, generate whatever instruction set they can from a very limited amount of logic; if they want to keep down part counts to satisfy the economics of very high volume consumers (such as television manufacturers).

Obvious Differences

An Assembly language programmer with minicomputer experience, when encountering a DP-oriented microcomputer, will find suprisingly few differences between the products as far as instruction sets are concerned. The most noticeable difference will be word length — commonly 8 bits for microprocessors and 16 bits for minicomputers.

Other noticeable differences are:

- Microprocessor instruction sets are almost uniformly well-suited to pure procedure programming; that is to say, these instruction sets naturally lend themselves to separate program and data memory areas, where the program memory will never be changed during the course of a program's execution and can therefore be defined permanently in read-only memory.
- Microprocessor instruction sets have relatively limited memory reference capabilities. Indirect and indexed addressing is rare, while even direct memory addressing is not always available.

Implied memory addressing is the principal method used by microprocessors; this involves maintaining memory addresses in memory address registers, then having memory reference instructions simply identify the memory address register where the memory address is to be found.

Surprisingly, DP-oriented microprocessors make very effective use of memory. For example, the Intel 8080A and the DEC LSI-11 will usually generate object programs requiring approximately the same total number of program bytes. The 8080A source program, however, will have two to three times as many Assembly language instructions create 1 byte of object code, while none create more than 3 bytes of object code.

This makes Assembly language programming far more tedious, and therefore expensive, when using a microprocessor; however, higher level languages are rapidly becoming available on the more popular microprocessors.

Today Basic is the most commonly used higher level language while PLM (a subset of PL/I) is in relatively common use. Fortran is just beginning to appear.

Microcomputer systems based upon DP-oriented microprocessors typically offer CRTs and keyboards, floppy disk units, cassette units and matrix or daisy wheel types of printers.

Fixed-disk units are not generally used since their data storage capacity and data transfer rates simply overwhelm the average microprocessor.

Similarly, very high-speed printers offer more capacity than a flopy disk-based system can utilize. Thus a typical microcomputer system will have these components:

- A microprocessor unit (MPU).
- Between 8K and 32K bytes of memory (64K bytes is the usual maximum).
- One CRT terminal.
- Floppy disks with a data storage capacity ranging between 250,000 bytes and 1 million bytes.
- A matrix or serial printer with print speeds ranging between 40 char./sec and 300 line/min.

This is a respectable computer system which a small company can use for its data processing. Such a system will cost approximately $10,000.

Speculating Ahead

It is interesting to speculate on the future.

Already it is possible to buy the Nova CPU or the PDP-8 CPU on a single chip. The PDP-8, by today's standard, is a relatively inefficient microprocessor.

The advances we are seeing in LSI technology make it probable that by 1985 single-chip CPUs selling for less than $100 will offer capabilities that rival mainframe computers available today. It is not unrealistic to expect CPUs with the performance of an IBM 360/40 to be available by 1985 and selling for less than $100.

It is already possible to buy 16K of read/write memory for less than $500. By 1985 it should be possible to buy 64K bytes of read/write memory for less than $200.

Thus hardware costs will continue their incredible downward spiral while performance will penetrate well into the area of 1977 mainframe computers.

It is hard to visualize what the impact of this technology will be on the DP industry in general. Certainly companies with a massive investment in application software are not interested in minor hardware savings that may accrue from inexpensive microcomputer-based systems. Also, until massive breakthroughs are made in reducing programming costs, reductions in computer hardware costs may represent too small a portion of the total installation expense to be significant.

Breakthroughs in programming costs are being made. Logical Machine Corp. has the Adam computer, which may make this breakthrough. This is a computer that can be programmed in English, with a user-created vocabulary. While Adam has not eliminated programming languages, it has gone a long way in this direction.

Logical Machine will probably be one of the principal beneficiaries of new, more powerful and less expensive microelectronics, since this will allow the "programless computer" concept to be taken from its present relatively primitive dimensions to computer systems that are really programmable by accounting professionals and nonprogramming personnel.

Osborne is president of Osborne and Associates, Inc. of California.

MICROCOMPUTING
CLASSIFIED
EXCHANGE

This special classified section in solid (non-display) format is designed for people who are working with or interested in microcomputing. Through it, you can buy, sell or swap equipment software or services; contact people with similar interests; start clubs; disseminate information; look for game partners; or send messages to other individuals. As the number of ads increases, this section becomes more useful; so we've tried to make ad placement as simple and inexpensive as possible. Details are as follows:

Ordering: The attached form will serve as the simplest way, we feel, to place your ads in Microcomputing Exchange. Please do not use it for other classified sections of Computerworld. They are display format and have different procedures and rates. Publisher reserves the right to refuse ads for this section, to limit the size of ads placed, and to limit the number of ads placed by any one person or company.

Payment: Must accompany your order. No exceptions. Your check will be accepted.

Copy and Closings: Deadline for copy to be in our hands is Friday, ten days preceding Monday issue. All copy must be submitted in writing (no copy taken over the phone), clearly typed or printed. We cannot be responsible for errors in printing made from illegible copy.

Rates: 80¢ per word. All words set in same size and typeface, up to first five words may be boldface. In making word counts, include name and address. Name of city (New York) or state (New Jersey) counts as two words. Zip code or phone number (including area code) counts as one word. (Publisher reserves right to omit zip code and/or abbreviate words if space is tight.) Count each abbreviation, initial, single figure or group of figures or letters as a word. Symbols such as RAM, CRT, etc. count as one word. Hyphenated words count as two words. No commissions paid to agencies.

Box Numbers: Are available at $5.00 per insertion. Send replies to box numbers to:
Box XXXX

Calcomp Workers On Shorter Week

ANAHEIM, Calif. — California Computer Products, Inc. has shortened its work week to a four-day, 36-hour week "to increase productivity, raise employee morale and reduce costs."

Under the plan, which became effective Aug. 1, the company switched to a four-day week, and lengthened the former eight-hour day by one hour. The employees' contribution to the plan is a reduction of 5% in their gross income, providing the company with an important cost saving, according to Calcomp.

The plan will also result in savings from reduced expenses for plant security, electrical energy consumption and maintenance.

The "4-36 Plan," as it has been dubbed, affects some 1,700 employees. Field sales and service personnel were not affected.

IEEE Members Form Good Government Group

NEW YORK — Members of the Institute of Electrical and Electronics Engineers (IEEE) have announced the formation of the IEEE Good Government Group (GGG).

The activities of the IEEE/GGG will be aimed at strengthening the leadership of the IEEE by identifying, endorsing and actively supporting the best available candidates for president, vice-president and directors, according to Dr. F. Karl Willenbrock, secretary of the IEEE/-GGG steering committee.

Candidates for IEEE offices who are interested in a possible endorsement by the IEEE/GGG should contact Willenbrock at the School of Engineering and Applied Science, Southern Methodist Univeristy, Dallas, Texas 75275.

The New PCMs — Part 1

IBM-Type CPUs Increasing

By Toni Wiseman
CW Staff

The ranks of plug-compatible mainframe manufacturers are steadily swelling as more and more vendors enter what some have called "anyone's horse race."

Is this the way of the future? How far will IBM allow these plug-compatible manufacturers (PCM) to go?

Will Brand X machines appear? How will new technology affect PCMs?

These are all questions being whispered in DP shops, but industry observers don't agree on all the answers.

IBM-compatible mainframes certainly form an attractive and viable marketplace, and most agree the industry can expect to see more firms joining the ranks of Amdahl Corp., Control Data Corp. and Itel Corp. The most likely candidates are the Japanese, some feel, but another U.S. competitor may still register his colors.

"I don't think the companies are looking at the giant with the idea to stab IBM. They're simply accepting it as a market force, as a mountain sitting there and so — mine the mountain," Art Yerkes, Datapro Research Corp.'s mainframe editor, said.

"IBM is so big and its installed base is so big that there's enough throw-off on this thing that it creates a new type of product — the plug compatible," Yerkes believes.

"It wouldn't be reasonable at this point for anyone to make a Honeywell- or Burroughs-compatible machine because they're not as big as IBM, which probably has about 80% of the market. But if, hypothetically, someone got lucky and came up with a system that erodes half of IBM's market so each has 40%, the remaining six dwarves et al still have only 20% divided among them.

"But now there would be two huge markets to attack with plug-compatible machines," he said.

It's clear that PCMs are having a very powerful effect on IBM because the corporation is obviously doing a variety of things to react — the 3033 for instance, Elinor Gebremedhin, project editor at Auerbach Publications, noted.

This is the first article in a three-part series that looks at the fast-developing plug-compatible mainframe scene and its various players, including IBM.

Part 2 will examine marketing strategies, counterstrategies and new technologies from the viewpoint of industry observers; Part 3 will consider the phenomenon from the viewpoint of the investment community.

"All you have to do is look at Amdahl deliveries and the fact that it got profitable so quickly" to realize the attraction of the market, she said.

A host of plug-compatible machines on the market will not take competition away, however, Gebremedhin suggested, since the machine is only a very small part of the situation. "It's the software background, the expertise of the manufacturer and the services it can deliver that are the more important part. The biggies are the system manufacturers, not the machine manufacturers," she said.

Important Edges

Nevertheless, PCMs do have some important advantages at the moment, according to Frederic G. Withington, senior staff member at Arthur D. Little, Inc.

"Without having specific delivery dates, people know the 3033 is a long way off and some of them are interested in a shorter term delivery. Also, Amdahl offers the 470V/5, which is under the 3033, and IBM hasn't announced a comparable product," Withington said.

"This all means that Amdahl and the others are in pretty good shape now, but of course this is a temporary condition," he warned. "The time will come when the new IBM processors are equally available and then that particular advantage for the PCMs will disappear."

The industry observers all agreed that plug-compatible products are probably not going to be the only form of competition. In fact, plug-compatible main-

(Continued on Page 42)

Nixdorf 8820 Reappears

CHICAGO — If you thought you saw a new intelligent terminal froim Nixdorf Computer, Inc. at Interface '77 last March in Atlanta, but wondered what happened to it, you can stop wondering.

The intelligent terminal system called the 8820 was shelved when Nixdorf acquired Entrex Corp. of Burlington, Mass., because its features could be incorporated more appropriately into the Entrex product line, according to a Nixdorf spokesman.

The 8820 can operate as a stand-alone terminal system or on-line with a host CPU and includes remote and real-time processing features and multiple disk storage. Its features will probably surface in a future Entrex product, the spokesman stated.

Nixdorf expects the acquisition of Entrex to double the size and capabilities of the German-based firm in this country, he said.

It's only logical that you should expect the best lease terms from the leader in computer re-marketing.

Comdisco Financial Services, Inc. is our subsidiary that will package the best finance lease arrangement for your new 158, 168 or 470V. We can react quickly to assure you a lease with the best rate and flexible terms. If you need help in disposing of your current system, we will buy it or help you sub-lease it.

When you re-think about it, it makes a lot of sense to lease your large systems from Comdisco, the logical choice.

Re-THINK

You don't have to think big

One of the biggest names in big computers just became one of the biggest names in small computers.

Because Sperry Univac just acquired Varian Data Machines. Lock, stock, and slide rule.

From now on, Varian's complete line of mini's will be brought to you by the minicomputer operations of Sperry Univac. The whole family—from the world's first mainframe on a board to the top of the line—will carry the Sperry Univac label.

Of course, these machines were always a good buy. But now they're assured of all the service and support that Sperry Univac can command. All the former VDM employees, all the dollars, all the dedication.

What's more, we're totally committed to

to think Sperry Univac.

supporting and enhancing Varian's current product line.

Write to us at Sperry Univac Mini-computer Operations, 2722 Michelson Drive, Irvine, California 92713. Or call (714) 833-2400.

The fact is, Sperry Univac is going to be a big success in small computers.

Sperry Univac. Mini's that think like mainframes.

SPERRY UNIVAC IS A DIVISION OF SPERRY RAND CORPORATION

Firms With Plug-Compatible CPUs Increasing

(Continued from Page 39)

frames are probably not even a good idea for some manufacturers.

Withington, for example, said he "feels strongly that the organization providing the operating system and the most compex systems programs in general is the piper which calls the tune to which the others must dance."

This means there are really only four organizations — IBM, Honeywell, Burroughs and Univac — which are in a position of leading the general systems parade, he said.

"This does not preclude, however, the PCM people from being so quick and capable that they can keep up with anything that's done by the systems programs people and at this point I'd call it a horse race."

Are plug-compatible machines going to be the "in" way to compete? Auerbach's Gebremedhin believes that while PCM systems are definitely an important market factor, they are not going to wipe out other types of competition.

"IBM has an important part of the market, but other mainframers are certainly going to hang on to what they have and develop their strong points," such as Burroughs' position in the financial and banking industry, NCR's in the retailing area and CDC's in the scientific arena, she said.

'Big Six' Entry Doubtful

While some of those interviewed said other mainframers could enter the plug-compatible mainframe arena, some doubted whether others of the "Big Six" would enter because to do so would, to a certain extent, undermine their own offerings.

Gebremedhin suggested that CDC is the only logical contender since it has been in the plug-compatible business for a long time and has been very successful with plug-compatible peripherals where other manufacturers have not.

In addition, CDC is not in the same position as some of the others, she pointed out, since it has largely concentrated on scientific systems in the past. It would therefore seem logical for CDC to enter the business end of the market with a plug-compatible machine.

Not Sensible

But, she added, it would not make sense for Burroughs, for instance, to offer an IBM-compatible machine which would compete with its check-processing systems.

Withington, on the other hand, said he could not see any reason why another mainframer could not build and market an IBM-compatible machine — and why that mainframer's base could not be a target for IBM or others.

He also proposed the possibility of a large mainframe corporation offering two entirely different large processors in the same price range — one with XYZ software and one with IBM software. While these two machines might compete internally in maybe 5% of the cases, it is rare for large users to switch from one operating system to another.

Japanese Expected

James Peacock, vice-president of International Data Corp., agreed it is reasonable to expect some new competition in the PCM market, but he expects the newcomers to be Japanese.

He pointed to the fact that Amdahl is working with Fujitsu and Itel has recently joined with Hitachi. Both Japanese firms already produce systems which are nearly IBM plug-compatible.

Gebremedhin observed that the Japanese have a problem in that they don't have either a software build-up or a marketing organization in this country. Therefore, it's entirely logical for them to team up with an American manufacturer that lacks the mainframe capability but has a large sales and marketing organization.

be the next firm to enter the market. "However, its expertise is more with a Honeywell-type system, so it may not go forward into the IBM market."

Counterstrategies are expected from all sides. Next week: What will these counterstrategies be, and how far will they go?

World wise.

75,000 Diablo Series 30 and Series 40 disk drives in service worldwide help prove their acceptance, dependability and performance excellence. Today these drives and our new Series 400 dual head positioner drives are backed by over 4,000 employees, and a million square feet of manufacturing and service facilities in the U.S., Europe and through our licensees in the United Kingdom and Japan. Reasons enough, we believe, for you to talk with your local Diablo representative. He knows your part of the world. Telefile Helping Xerox Systems Users Continue

By Toni Wiseman
CW Staff

IRVINE, Calif.— In the past year and a half since Xerox Data Systems (XDS) withdrew from the mainframe business, Telefile Computer Products, Inc. has made it its business to supply the needs of XDS systems users.

Not content with simply offering new peripherals, Telefile is developing two new Sigma mainframes for delivery in 1978. These include a microprogrammed Sigma 9 and a Sigma 11, designed to be four times faster than the present Sigma 9 at about half the price.

Telefile's strategy is to replace only the computing engine at first, and then gradually update the I/O and memory, to avoid a total replacement at once, according to president Sam V. Edens.

In addition to the CPUs, Telefile offers a wide range of hardware-compatible, software-transparent products including dual-density disk systems, printers, card readers, concentrators, main memory and mass storage facilities with up to 2.3 billion bytes per system.

A 317M-byte Winchester-type system with fixed-head option will also be available by the end of this year, Edens said.

Best Operating System

Telefile's whole philosphy is based on the concept that it is easier to take someone else's $100 million investment in software, such as Xerox's, and put another machine under it, than to develop new software, Edens indicated. And, he said, everyone from the users to Datapro agree that the Xerox operating system is the best available.

Amdahl has built a machine to run IBM software, so in some aspects Telefile and Amdahl are in the same business, Edens said. "But in our case, we have a lot more going for us because IBM's software is constantly changing, whereas there is no one left at Xerox's helm to make changes, so we are dealing with a known quantity. We don't need a crystal ball," he noted.

Honeywell's goal is to convert Xerox users to their Level 66, but that is a fairly large machine. Sigma 9 users are prime candidates for conversion but those with an 8, 7, 6 or dual 5s are not ready to make the move, Edens stated. "Those users have to at least be upgraded to a 9 before they can think of converting to a Level 66. That means there's a tremendous market out there for us."

Edens said he feels Honeywell's recent product announcements, such as retrofitting disks to older iron, are the result of the market of Sigma 5, 6, 7 and 8 users. "They are going to have to keep the user base intact for longer than they thought," he said. "I don't see people with Sigma 6s going to a Level 66 before 1985."

Telefile's relationship with Honeywell, which took over maintenance of the Xerox user base, has been an amiable one so far. Their goals are essentially the same: to keep the Xerox user base alive and up to the state of the art. Telefile, however, doesn't care if the users ever convert to a Level 66 machine, Edens noted.

Edens' firm wants to enhance the Xerox systems not only through core and new peripherals but also by going beyond the specified core limits. That is why Telefile put Memory Map on the Sigma 5. The T8215 Memory Map allows Sigma 5 users to take advantage of the CP-V and CP-R software originally designed for Sigma 6-9 systems and permits multiprocessing.

The entire Xerox user base amounts to only about 1,400 sites, so there isn't much impact on Honeywell's financial picture. But for Telefile, that represents a substantial market, Edesn said, noting there is very little defection among Xerox users.

This means Telefile is not interested in buying Sigmas from users unless there is no way to prevent users from switching vendors. When there is no other way, however, Edens will buy a Sigma 9, for instance, to keep the business intact until Telefile's Sigma 9 emulator is available.

"The Sigma 9 and 11 in development are set up to solve the problem we will face in time when we can't keep the base intact through enhancements and upgrades anymore," he said.

IBM Appoints Three Fellows

ARMONK, N.Y. — IBM has named three new IBM Fellows, an award which provides the three with the opportunity to pursue technical projects of their own choice for the next five years.

The new Fellows are:

- Dr. Alec Broers, a pioneer in the development of high-resolution scanning electron microscopes and in the application of electron beam technology to the fabrication of ultraminiature computer devices.
- Donald K. Rex, for significant contributions to the development of multifunction card-handling equipment. Rex was recently a key figure in the development of a small terminal matrix printer.
- Thomas H. Simpson, the designer of a multitask operating system for the National Aeronautics and Space Administration's Saturn-Apollo program. Simpson's revised version of the system is IBM's Hasp.

Fabri-Tek has an ace in the hole for PDP 11/70 users.

The Model 7011 Add-on Core Memory. Totally plug-compatible with the PDP 11/70. Compact expansions up to 2 megabytes in 128K byte increments. Improved performance with cycle time of 650 nanoseconds, access time 250. Parity checks and interleaving are standard features. Plus, of course, the reliability of non-volatile core. With our prices and 30-day delivery, you can't afford not to get in the game.

Fabri-Tek is the only independent to cover the entire DEC PDP 11 Series with both core add-ons and semiconductor add-ins. Whatever your requirement, we'll deal you a winning hand.

512k bytes in 10.5" of rack space

When it comes to memory expansion, we've stacked the DEC.

PDP-11 Leading Choice for Military Standard

By Edith Holmes
CW Staff

DALLAS — Digital Equipment Corp.'s PDP-11 architecture is "the leading candidate for the standard" computer that will be used in all U.S. military operations, a conference speaker said here recently.

Spearheading the Military Computer Family Program that eventually could serve all branches of the Department of Defense (DOD), the Army would like to stop inventing computer architectures and look to the commercial world to meet its computer needs, Lt. Col. Alan B. Salisbury of the U.S. Army Electronics Command said.

The DOD spends $3 million a year on software development, according to figures from the Office of the Secretary of Defense. A common architecture base for a family of computers used by the military would give DOD "true transportability of programs between these battlefield systems," Salisbury stated.

By architecture, the Army officer indicated he meant "what the computer programmer sees as he looks at the mainframe from the machine level." In other words, his concern — and DOD's — is with "instruction set architecture."

The Army's attempt to develop a family of architecturally identical machines is not new, Salisbury noted. Between 1969 and 1974, a program called Family of Compatible Computer Elements (Facce) had similar goals.

What the Army learned about computer family interfaces and configurations with Facce will be very helpful in the current Military Computer Family Program, he added.

The PDP-11, will provide the Army with the "form fit in function for computer modules for the military computing" it needs, he said.

No Closed Doors

At the same time, the DEC machines won't mean the Army has closed its mind and doors to research in computer architecture.

In addition, in order to maintain its deployed computer resources, the Army doesn't want to have to have 35 different kinds of spare parts on hand, Salisbury commented.

In terms of continued computer architecture research, the Army will remain interested in system-level modifications — new ways of interconnecting, interfacing and configuring its family of mainframes. "We are particularly looking for ideas in distributed system architecture," Salisbury said.

If military computers are to be able to survive attack, they must be distributed, he contended.

Research in micro-level architectures, the hardware point at which standard instruction sets might be implemented, is also in demand by the Army. Microprogrammable modifications that would permit the system to run new programs and still emulate the old architecture for old software need to be developed as well, Salisbury indicated.

The Army plans to stay with whatever commercial architecture it settles on for the near future. However, the DOD branch expects to be open to expansions of that architecture.

Industry Hit For Lack of Ideas On Architecture

DALLAS — The U.S. government has received very few good private industry research proposals for work to be done in computer architecture, according to panelists at a recent conference here.

The industry has created microprocessors by increasing the density of logic placed on a chip, Dr. John Lehmann of the National Science Foundation (NSF) noted. Now fundamental research is needed that will permit the successful combination of these chips in numbers like 10,000 and up, he said.

These new microprocessor-based computers are likely to be quite different from what we recognize as mainframes and minicomputers today, Lehmann added.

"We will need to develop the interconnections, communications, reliability and fault-tolerance capability for these machines," he stated. The algorithms needed to solve standard computational problems may also require change.

Funds Available

NSF has approximately $1 million available to support basic work in computer architecture, Lehman said. With the lower cost of electronics associated with micro-based processors, he hopes some of this money will flow back to the universities that deferred to industry in the research area during the late 1960s and early 1970s when costs soared.

The Air Force, too, has money to burn in the area of computer architecture if only it could find people with sound proposals to fund, Lt. Col. George W. McKemie of the Air Force Office of Scientific Research at Bolling Air Force Base said.

Among the research thrusts the Air Force believes are needed to accompany the potential that micros have are work in design methodology, performance and complexity and operating system and applications software, McKemie stated.

Make the right data entry decision today and you'll never regret it tomorrow.

Cummins Key/disk and KeyScan® Systems.

If you look at your data entry requirements today with an eye to the promise of tomorrow, you can't help but select a Cummins System. The Series 3400, 4400 and 5400 Systems have virtually unlimited software and peripheral capability.

Specialized application software is available for inventory control, payment processing by batch or transaction, accounts payable/receivable. Peripheral i/o devices include hi-speed MICR/OCR reader-sorters, tag readers, terminal scanners, OCR wands, card readers.

No other shared-processor system offers the flexibility and potential for expansion as the Cummins line of dispersed processing systems.

Check out the Cummins Systems. Whether you need a Key/disk system or a complete KeyScan Multimedia System, you'll always be ready for tomorrow. Isn't it good to know that the system that will do the best job today will also keep pace with your needs tomorrow?

At Competitive Disadvantage

U.S. Firms Unsupported Abroad: ADL Head

WASHINGTON, D.C. — Although the U.S. leads the world in telecommunications technology, American suppliers labor under extreme competitive disadvantages in marketing their products and services abroad, according to John F. Magee.

Magee, president and chief executive officer of Arthur D. Little, Inc. (ADL), testified here recently before the International Operations Subcommittee of the Senate Foreign Relations Committee during hearings on the role and control of international information and communications.

'Low interest rates and extended terms are part of the export packages German, Swedish, Japanese and even South Korean equipment manufacturers can offer, but which American suppliers cannot," Magee said. "Those nations look to the longer term, when the very system and products they sell today under such favorable conditions help generate the future cash flow to pay for themselves.".

These aggressively supportive foreign trade programs contrast with policies and attitudes in the U.S. that are passive and even antagonistic, the ADL president continued.

Tax Act of 1976

He cited the Tax Reform Act of 1976 as another factor that has further undermined America's competitive position in the international marketplace. Overseas cost reimbursements to companies and deductions for their employees, formerly allowed to offset the business and personal expense of operating and living abroad, have been eliminated or reduced.

As a result, the American managerial and technical presence in foreign countries is already beginning to diminish. The U.S. is losing one of its strongest selling points — the export of technological talent together with its industrial systems, Magee said.

"In our information-oriented world, telecommunications is a key building block in creating a sound infrastructure for economic growth . . . Telecommunications investments provide more reach per dollar than other investments in bringing people up to the last quarter of the 20th century," he said.

Magee expanded on this view by pointing out that a telecommunications system makes it possible for a developing nation to establish connections with the outside world, helping to break its isolation and the log-jam that keeps its industrial and resource potential locked in.

Traditional Symptom

"Low per-capita telephone density traditionally has been regarded as a symptom of low economic development," he continued. "But now, many of us believe the symptom has become ingrained and should be counted as one of the major causes of underdevelopment."

Magee referred to a traditional view of telecommunications which holds it to be an outgrowth of a solidly established industrialized society whose vitality generates an increasing need for business and personal messages.

"This is now an outmoded thesis rejected by the less-developed and developed nations alike. There is a growing recognition today that telecommunications is more of a precondition than a consequence of industrial and social development," he said.

Calling for a review of long-held biases and for measures to bring U.S. telecommunications export policies in line with current world realities, Magee concluded that "every foreign sale of American high-technology or heavy-industrial systems lays the foundation for add-on business in the same or associated areas.

"Every group of American technicians overseas trains a generation of foreign technicians. This is a kind of technology transfer that creates a continuing demand for more of the same systems, or their successors.

"For every such sale we lose to another country, and for every American technician who does not serve as a technological ambassador, our base of foreign trade is eroded, jobs at home are wiped out and an opportunity to impart understanding and respect for American culture is lost."

Used Unit Sales Up 62% in '76

CHICAGO — Members of the Computer Dealers Association (CDA) sell 39% of the volume of the largest used capital asset business in the world, according to a recent survey taken by the association.

Of the $1.2 billion worth of used computers purchased in 1976, the 64 CDA members sold $463.9 million, an increase of 62% from fiscal 1975.

The report also revealed 96% of these sales were in IBM equipment because IBM's policy allowing maintenance agreements to other than original owners is a tremendous sales advantage. CDA members also spent $87.4 million on new IBM equipment just to support their trades in used equipment.

No one has more 11/03 systems and microNOVA's available off-the-shelf than we do.

Not even DEC and Data General.

If you're developing a prototype system and need components fast, give us a call. The same goes if you need a large order pronto.

We've got all the DEC 11/03 hardware, firmware, and software you'll ever need — from processor boards to full systems. Available now. Off-the-shelf.

We've also got Data General microNOVA processors, computers, and full development systems. Available now. Off-the-shelf.

Plus a distributed processing communications module that lets one computer talk to another (including IBM) over any phone line. Available now. Off-the-shelf.

Data Systems Marketing can ship you all these products — plus printers, terminals, and accessories — the minute you need them.

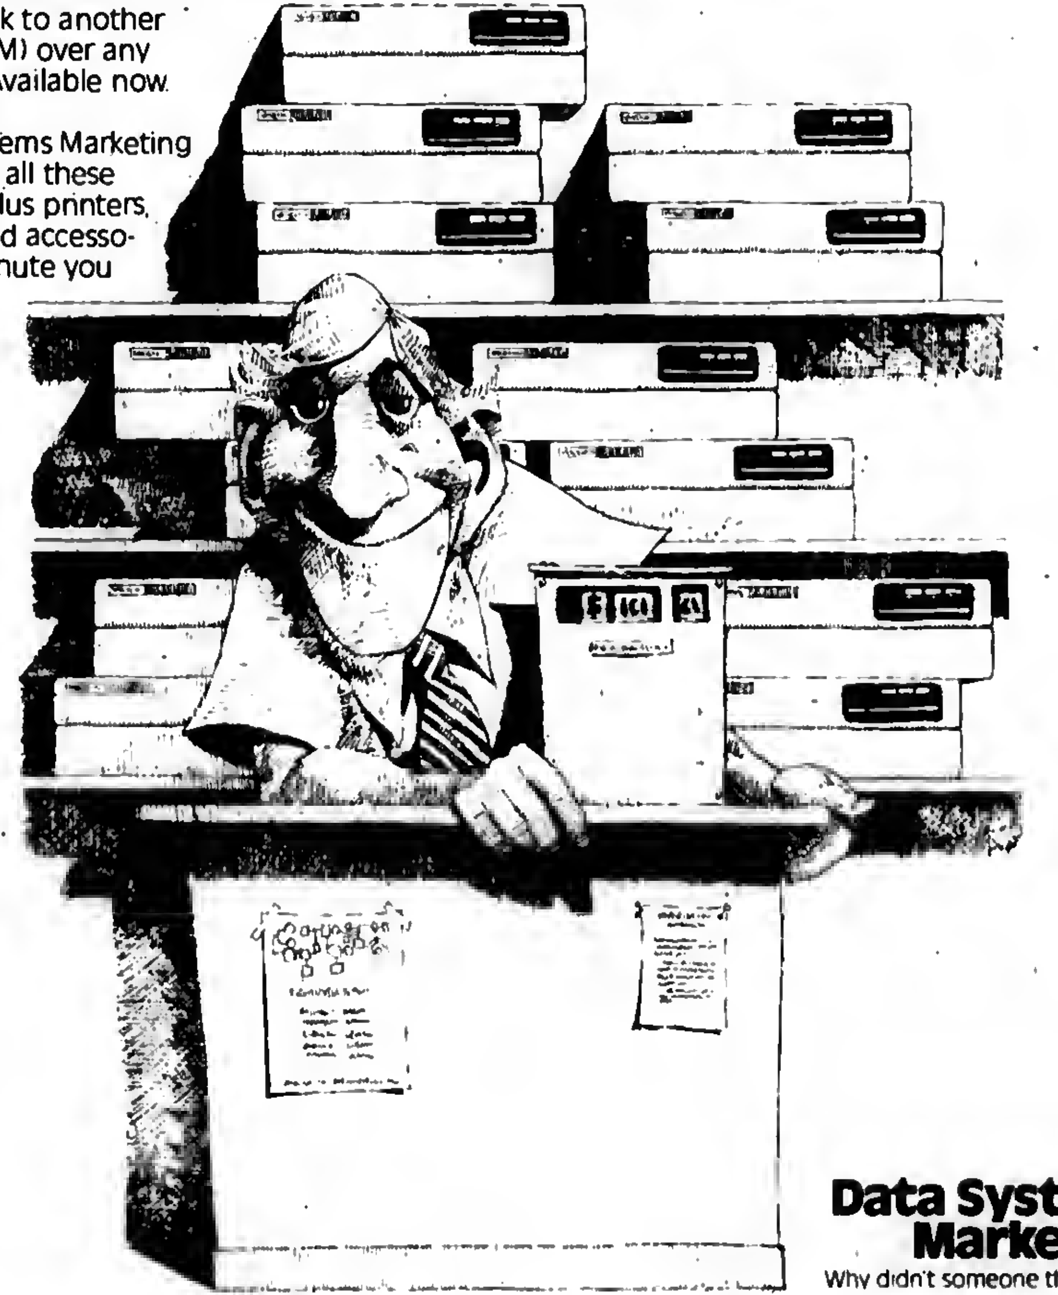
We've got super low prices. Convenient leasing plans. And an experienced sales staff to answer all your questions.

Data Systems Marketing. It's a whole new concept in computer sales. A chain of showrooms fully-stocked with a wide selection of microcomputer related products.

It's a place where you can see them. Play with them. And buy them.

Off-the-shelf.

And that's on the level.



Data Systems Marketing

Why didn't someone think of this before?

Orders Up 25% in Quarter

Univac '80 Revenues Seen Topping $2 Billion

By Molly Upton
CW Staff

NEW YORK — Sperry Rand Corp.'s computer revenues should exceed $2 billion by 1980, Chairman J. Paul Lyet told stockholders at the firm's annual meeting here recently.

"Computer revenues have grown 15% per year for the past five years and profits have done even better," Lyet observed.

To add credibility to his projection, he pointed out that Sperry was within 2.5% of its recent five-year projection of earnings per share. Sperry's goal this year is a 12% to 15% increase in earnings.

Sperry prefers not to divulge earnings and revenues of its individual divisions, but Lyet said the Univac division did "very well" in the first quarter in terms of both orders and profits compared with other computer companies.

"We have felt it would be disadvantageous to us to set forth separately how we're doing in our competitive segments," he told a stockholder seeking more information.

The corporate backlog rose 22% from $2.09 billion at the beginning of the fiscal year to $2.2 billion at the end of the first quarter. Univac orders rose 25% in the quarter.

The Sperry Division's orders jumped 99%, reflecting defense contracts.

Univac President G. Gerald Probst said later the Univac orders were distributed across the product line, adding demand for the 1100/80 exceeded expectations. The 90 series — especially ~~the 90/80~~ and 90/30 — was also strong, he added.

New Products Coming

Lyet told the press Univac will have some product announcements it thinks are going to be significant in the next 12 months.

The firm is continuing to invest "very substantially" in research and development in the 1100 and 9000 series, as well as the 90/30 family.

"At Sperry Univac in particular, we have spent more on R&D as a percentage of revenue than any of our four largest competitors over the last five years," Lyet told shareholders.

"This means we have products in the oven we can serve up in future years that will provide continued growth.

"R&D spending will be up 13% to 15% this year," he continued. Last year the firm spent $168 million in R&D, 60% more than five years ago.

The firm is working on LSI circuitry, fiber optics, electron beam lithography and a nonimpact printer with speeds of 10,000- to 20,000 line/min, he said.

None of the products coming out within the next 12 months will have bubble memories, he told the press.

Sperry has great hopes for its latest acquisition, Varian Data Machines, Lyet indicated to the press.

Noting that Information Storage Systems (ISS) has been one of Sperry's most successful acquisitions, Lyet said he feels this type of benefit will be paralleled by the Varian acquisition. He expects Varian's growth to be as rapid as that of ISS, he added.

Robert E. McDonald, president of Sperry, said the basics are there, but Sperry is adding some management and marketing capabilities. He admitted the Varian software needs some help and the product line should be broadened.

When asked about the impact of the IBM 3033, McDonald said Univac brought out the 1100/80 with the recognition that IBM would have a powerful machine. Univac has not been impacted by the 3033 and has "won some tough competition," he added.

"I suppose if IBM had not brought out the 3033, maybe our profit margin would have been greater, but that's not the real world," he mused.

McDonald indicated he thinks the specter of a price war among IBM plug-compatible CPU makers, including the Japanese, "a significant long-term competitive challenge."

Lyet reiterated, as he does every year, Univac's eagerness to form joint ventures similar to the one it has with Saab Scania. Noting he is very pleased with Saab Univac AB, which has obtained orders from Scandinavian Airlines for an airline reservation system and from the Swedish postal authority, Lyet said such a joint venture ought to work in other parts of the world.

Surmising on why Univac has not had any other takers, Lyet observed firms in other countries have had good support from their governments. He also suspects they don't want to be captive to the Americans in the computer business since it is so integral to business. "They want to be master of their own fate," he added.

"We still stand ready to deal and have got our antennae up," Lyet said.

Extolling the virtues of expenditures, Lyet said that in five years about 80% of Sperry's revenues will come from products not on the market today. "This is how to keep a company viable, dynamic and alert, even though it impacts your P&L statement," he said.

Lyet expounded on his theory of why Sperry Rank's stock is as low as it is. When computer stocks were high, Sperry's revenues were more cyclical and although the firm was a conglomerate, it was "metaphorphasizing" into a computer company.

After extensive efforts to educate the investment community that it should be treated as a computer company, the computer stocks started to go down. In the meantime, farm machinery was becoming suspect because of uncertain demands.

Sperry Earnings Rise 7.8%

NEW YORK — Earnings increased by a larger percentage than revenues at Sperry Rand Corp. during the first quarter ended June 30, which marked the firm's 21st consecutive quarter in which earnings and revenues showed improvement over the year-ago period.

Earnings hit a record $37.5 million or $1.08 a share, up 7.8% over the $34.8 million or $1 a share in the same period last year.

Revenues rose 5.1% to $827.9 million compared with $788.1 million in the same 1976 period.

On a 12-month running basis, revenues were up 2.8% to $3.3 billion while earnings rose 8.7% to $159.5 million.

By March 1978, Univac will have increased its commercial marketing force, exclusive of the organization set up for the BC/7 and the people gained through the Varian acquisition, by 44% compared with nearly two years ago, Sperry Rand Chairman J. Paul Lyet said.

For Investors, Marketers

Bowers Adds Five Services

FAIRFIELD, Conn. — Bowers Engineering Co. has added five fixed-price packaged services to its line of consulting and engineering packages.

The Quick Study was designed for investors, potential acquirers or users planning a major vendor commitment, and in need of a professional overview of a company, its personnel, products, resources, competence, etc. Quick Study is said to offer a one-day on-site analysis, with written report, for $500 east of the Rockies, $750 in the West.

Acquisition Analysis was designed for companies seeking to acquire products or other companies in a particular technical area. It identifies potential acquisitions and evaluates the companies, their products, market position and financial strength, the firm said.

The top candidates are selected and evaluated on-site, and recommendations and strategy are presented. The package is priced at $3,900.

OEM Buyer Analysis identifies attractive markets and potential OEMs for a client product, the firm claimed. The OEMs, their market strengths and their make/buy attitudes are assessed and the top prospects are evaluated on-site for a fee of $3,900.

Equipment Evaluation is offered to users considering equipment purchases, vendors wanting an independent critique of their equipment, and acquirers needing to understand the quality of a product they are acquiring, Bowers said.

The equipment of interest and its vendor's methods are evaluated as to design, manufacturing processes, testing and quality control in light of the client's needs and applications. Existing installations and customers are investigated for $2,700.

Competitive Analysis consists of a survey of equipment or service being marketed, vis-a-vis a client product or a contemplated product, according to Bowers. It includes an analysis of the client's product, a complete survey of all competitive companies and analysis of their products and markets for a fee of $2,700.

Bowers is located at 1214 Post Road, Fairfield, Conn. 06430.

Expansions

Data Terminal Systems, Inc. will begin construction of a three-story 75,000 sq-ft addition to its existing manufacturing space in Maynard, Mass., and a 40,000 sq-ft renovated facility in Stow, Mass.

Synertek has begun construction on a 61,000 sq-ft facility in Santa Clara (Calif.) Business Park to be used as its corporate headquarters.

Computer Automation, Inc. has more than doubled its operating space with the completion of an 81,000 sq-ft facility at 2181 Dupont Drive, Irvine, Calif.

Magnetic Peripherals, Inc. has expanded its production operations with the addition of a 40,000 sq-ft Aberdeen, S. Dakota plant.

Unitrode Corp. has begun operations in its 10,000 sq-ft production facility in San Diego.

National Data Corp. of Atlanta has established a branch at 17921 Sky Park Circle in the Airport Industrial Complex at Irvine, Calif.

Compu-Serv Network, Inc. has begun building a $1.2 million computer center near Dublin, Ohio.

Linolex Systems, Inc. has moved its manufacturing and product development facilities to Bedford, Mass.

New Registrations

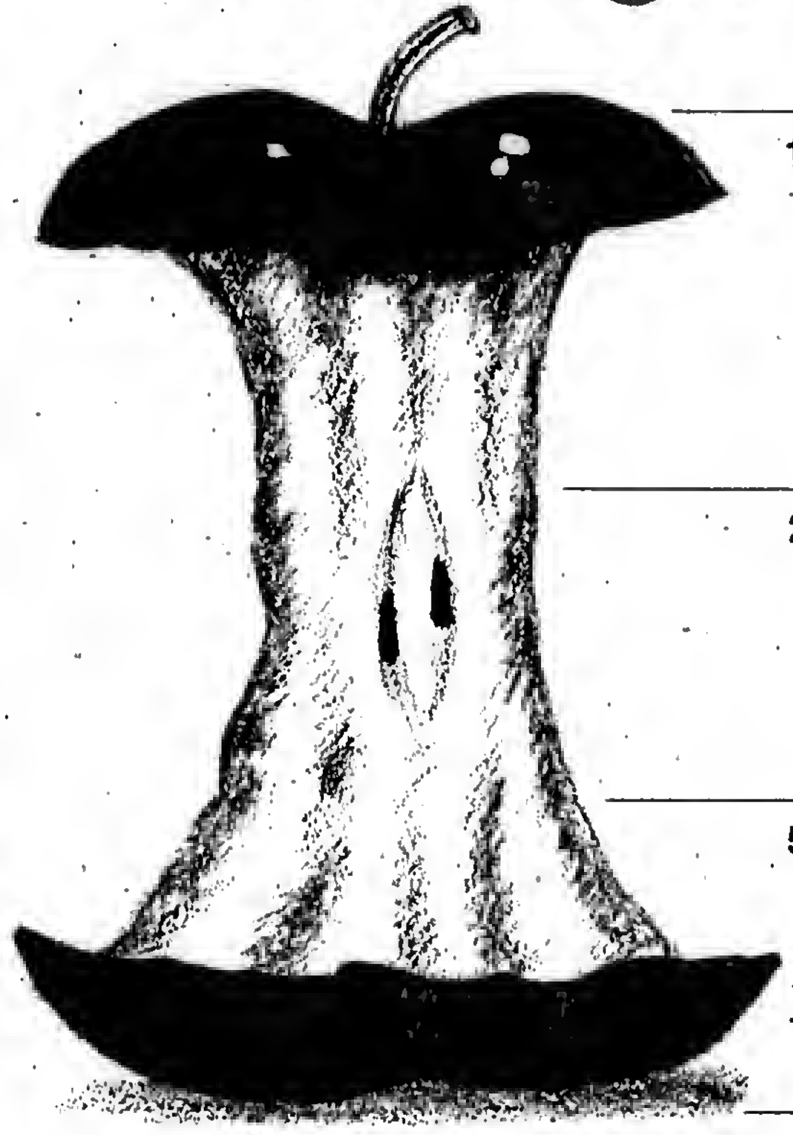
MEMOREX CORP., San Tomas at Central Expressway, Santa Clara, Calif. 95052, filed to register 200,000 shares of common to be issued in connection with the merger of Lencor International into a wholly owned subsidiary of Memorex. The merger will result in the conversion of the outstanding shares of common of Lencor into the Memorex common and $2,440,000 in cash (subject to certain adjustments). No underwriter is involved.

MOTOROLA, INC., 1303 E. Algonquin Road, Schaumberg, Ill. 80196, filed to register 2,250,000 shares of common to be issued to the stockholders of Codex Corp. pursuant to a statutory merger of a wholly owned Motorola subsidiary into Codex. Motorola will issue 1.125 shares of Motorola common, subject to certain adjustments, for each share of Codex common outstanding on the effective date of the merger. No underwriter is involved.

AMDAHL CORP., 1250 E. Arques Ave., Sunnyvale, Calif. 94086, filed to register 560,000 shares of common to be offered for selling security holders through underwriters represented by the First Boston Corp., 20 Exchange Place, New York, N.Y. 10005, and E.F. Hutton & Co., Inc., One Battery Park Plaza, New York, N.Y. 10004. Of the 560,000 shares being offered, 460,000 are presently outstanding and 100,000 are to be issued upon exercise of warrants held by two security holders.

ITEL CORP., One Embarcadero Center, San Francisco, Calif. 94111, filed to register 2 million shares of cumulative preferred to be offered for sale through underwriters represented by Blyth Eastman Dillon & Co., Inc., One Chase Manhattan Plaza, New York, N.Y. 10005, and Paine, Webber, Jackson & Curtis Inc., Broadway, New York, N.Y. 10005.

Get 3 to 10 partitions + from a single system at a single low price.



128K Core	• Resident Directory Support • Automatic Volume Recognition • Generic/Referral Assignments • Power III™ • DASD Space Management • 255 LUBS Per Partition • Cataloged Procedures • Relocating Loader w/CIL Compression • 2x40K Batch Partitions

512K Core	All of the above plus... • Resident Access Methods • Job Schedular • 8x60K Batch Partitions
1024K to ∞ Core	All of the above plus... • 8x100K Batch Partitions

IBM Users: Dearborn's DOS/RS™ is all the software you'll ever need, no matter what your core size...128K to ∞

At last... growth potential for your S/360 or S/370 with the latest version of Dearborn's Operating System/Real Storage.

DOS/RS is the single, fully-integrated system with total capabilities written into it—from the outset—to let you improve throughput beginning with the most modest core size right up the scale to 1 Mg... and beyond.

DOS/RS is the major enhancement of DOS Releases 26 and 27 that improves, extends and helps evaluate itself... without combining several different systems... without adding or modifying an existing system... without maintenance problems... without added costs.

DOS/RS improves 360/370 performance without installation and conversion problems. Installation is quickly accomplished in an orderly manner since all standard DOS functions are supported. What's more, many DOS/RS features will begin operating automatically. Then, as your core size and requirements increase, DOS/RS permits a gradual, phase-by-phase conversion to total DOS/RS capacity.

VISAM—a direct replacement for ISAM

Dearborn's new Variable-Length Indexed Sequential Access Method can be added to improve processing throughput and utilize disk storage more efficiently.

For detailed information on the all new DOS/RS and VISAM, call the nearest Dearborn office or write:

Chevron

Small Business Mart Seen Growing Abroad

LONDON — The installed base of small business systems in Europe is imposing, but the most impressive growth is in annual shipment figures, according to *EDP/Europa Report* (EDP/ER).

"With the lines of demarcation between the [small business system] and systems larger and smaller becoming hazier each year, the [small business system] is one of the most pervasive influences in the computer world," EDP/ER said, but noted that defining a small business system is all but impossible except by example.

International Data Corp. divides the market into three segments: the low-cost minicomputers-based systems costing $20,000 or less (NCR 399, Nixdorf 820, Digital Equipment Corp. 300); the middle range with prices between $20,000 and $50,000 (IBM System 32, NCR Century 8200, Honeywell Information Systems Level 61, DEC Datasystem 500); and the top end with prices up to $150,000, which could include some general-purpose systems such as the Burroughs B1700, International Computers Ltd. 2903 and Univac 90/30.

EDP/ER projected the installed base in Europe will grow from $6 billion at year-end 1976 to about $14 billion by the end of 1980, when annual shipments will reach $3.5 billion.

"Over this period it is also expected that the price of the smaller units will continue to fall as a result of the influence of microprocessor technology [and] medium-priced units will increase in price as the complexity of the [small business system] increases. At the larger end of the scale, the most important factor [is] the cost of the software for systems and applications.

The report noted that the most important difference between the European and the U.S. markets is the importance of independents in Europe, most of whom have developed from the traditional office equipment markets, according to the newsletter.

International News

In terms of market share by value, IBM tends to dominate in the larger systems area except in France, where CII/Honeywell Bull holds 38% of the market compared with IBM's 36%, and in the UK where ICL/Singer has 30% of the market compared with IBM's 25% and Burroughs' 20%.

The giant, however, commands 50% of the German market, according to EDP/ER figures.

In the small arena, the market shares are much more evenly spread. In Germany, for instance, Nixdorf has 30%, Kienzle 20%, Philips 15% and Olivetti 12%.

Philips claims 20% of the French smaller system market, while Kienzle and Nixdorf each have 15%, Olivetti 12% and Burroughs and Logabax each 10%.

Burroughs dominates the UK market with 40% followed by NCR with 20% and Olivetti and Logabax with 10% each, EDP/ER said.

"It will be seen that the situation at the moment is open, even IBM's dominance is only relative and there would appear to be a chance for all," EDP/ER stated.

Soviets Start Building New Generation CPU

YEREVAN, Soviet Armenia — The Soviets have begun batch production of the Nairi-4, a fourth-generation computer, at the Elektron plant here, according to the Novosti Press Agency in Moscow.

"Its productivity is 500,000 operations per second and it has an internal storage capacity of 64,000 alphanumeric symbols," Novosti stated.

The Nairi series of computers, designed by the Yerevan Research Institute of Mathematical Machines, are used throughout the USSR and other countries, the agency said. They are small multipurpose machines used for financial, design and research applications, it noted.

The Nairi-4 differs from previous models in that "for the first time a model in which the principle of nanoprogramming is employed has been designed in the USSR," according to a Novosti release.

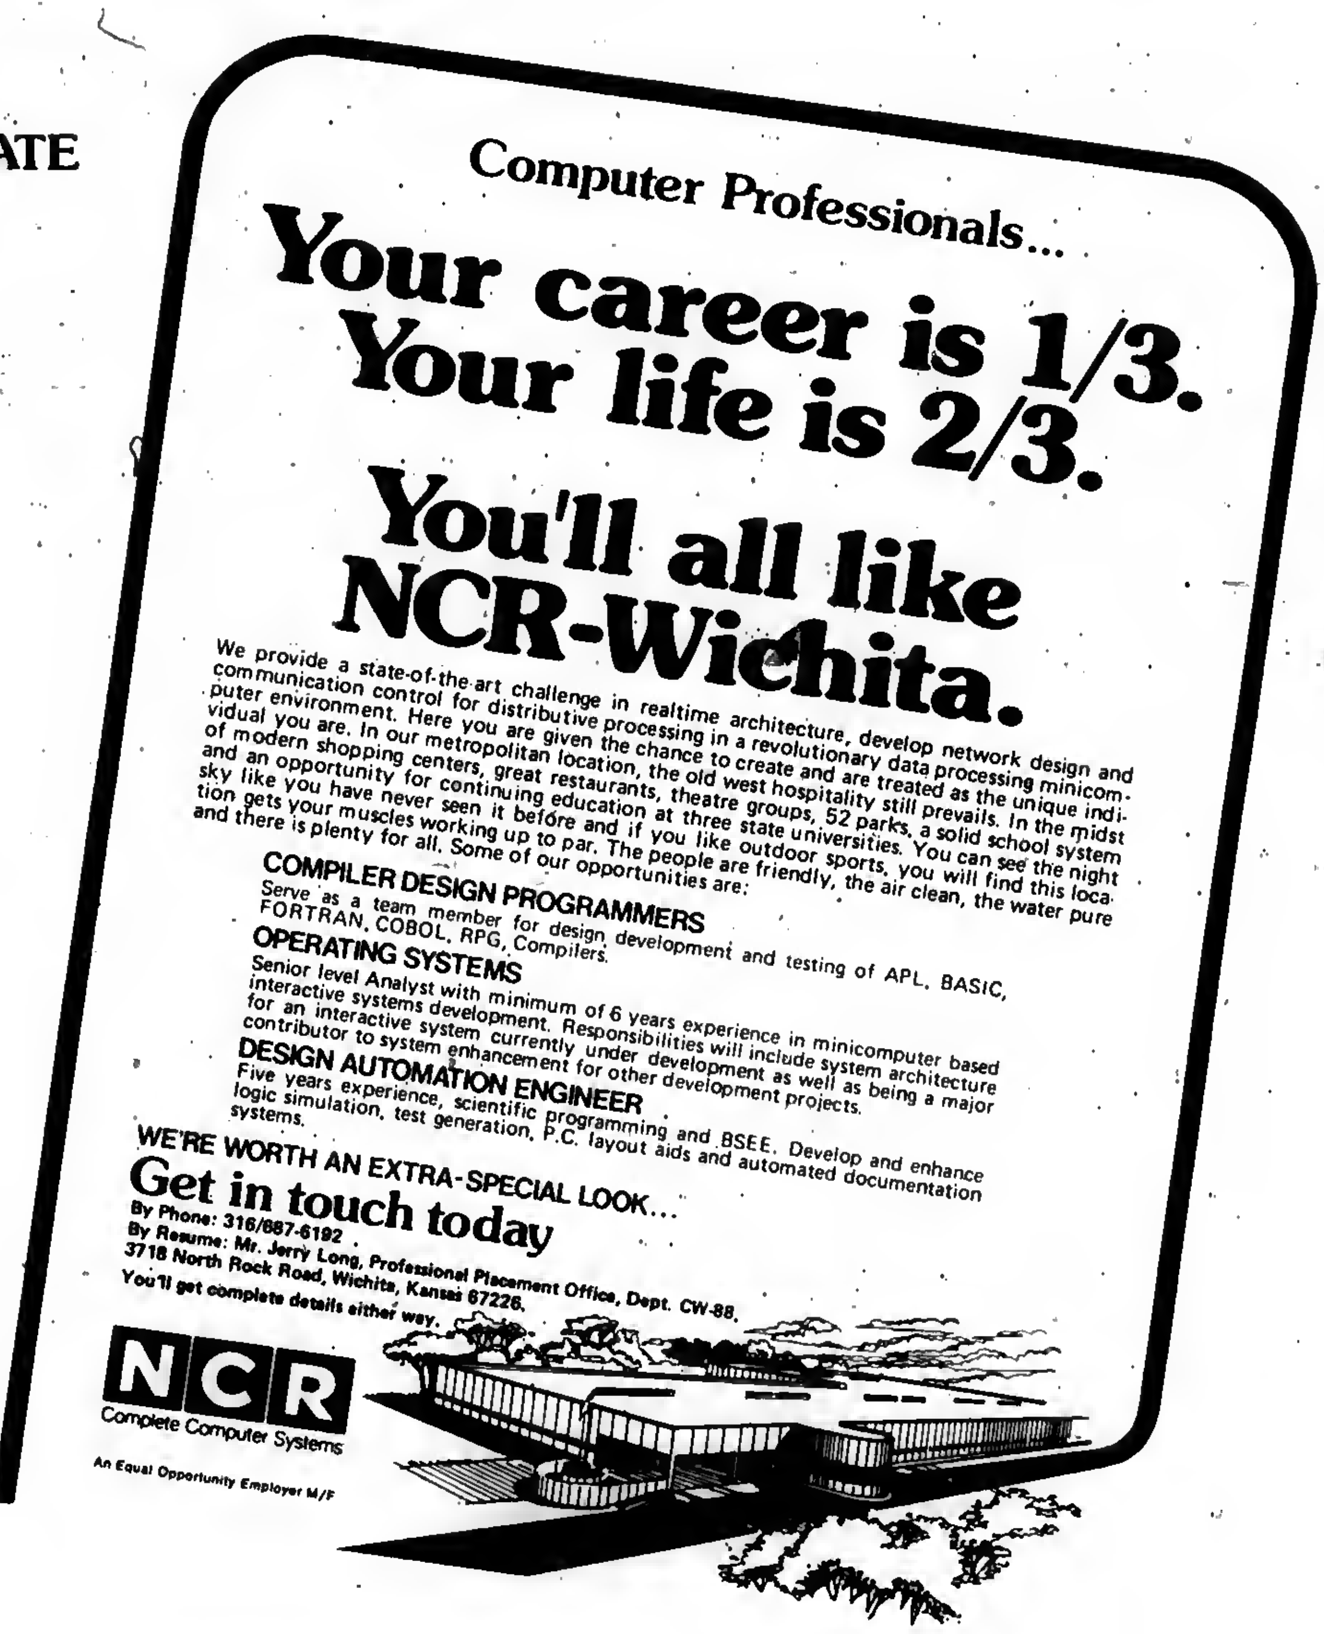
"It ensures the interpretation of a system of microcommands and the unification of the means of control.

"Because of the use of so-called microbrackets, the size of the machine was reduced and its reliability was enhanced. The structural possibilities and technical parameters of the computer make it possible to tune it to the solution of various concrete problems," Novosti stated.

NCR-Wichita thanks you for the excellent response to our recent advertising campaign

As a result of our continuous growth pattern, a number of high level positions are still available. If you are degreed and have a minimum of 4 years experience, look ahead to the opportunities NCR-Wichita can offer.

WE WELCOME YOUR IMMEDIATE RESPONSE...



Computer Professionals...

Your career is 1/3. Your life is 2/3.

You'll all like NCR-Wichita.

We provide a state-of-the-art challenge in realtime architecture, develop network design and communication control for distributive processing in a revolutionary data processing minicomputer environment. Here you are given the chance to create and are treated as the unique individual you are. In our metropolitan location, the old west hospitality still prevails. In the midst of modern shopping centers, great restaurants, theatre groups, 52 parks, a solid school system and an opportunity for continuing education at three state universities. You can see the night sky like you have never seen it before and if you like outdoor sports, you will find this location gets your muscles working up to par. The people are friendly, the air clean, the water pure and there is plenty for all. Some of our opportunities are:

COMPILER DESIGN PROGRAMMERS
Serve as a team member for design development and testing of APL, BASIC, FORTRAN, COBOL, RPG, Compilers.

OPERATING SYSTEMS
Senior level Analyst with minimum of 6 years experience in minicomputer based interactive systems development. Responsibilities will include system architecture for an interactive system currently under development as well as being a major contributor to system enhancement for other development projects.

DESIGN AUTOMATION ENGINEER
Five years experience, scientific programming and BSEE. Develop and enhance logic simulation, test generation, P.C. layout aids and automated documentation systems.

WE'RE WORTH AN EXTRA-SPECIAL LOOK...

Complete Computer Systems

An Equal Opportunity Employer M/F

When less computer equals more performance, small really is beautiful.

A special report on *Minicomputers and Small Systems* in the August 29th *Computerworld.*

Minis are now functioning at every level of business and industry, and *Computerworld's* August 29th special report, edited by Esther Surden, will focus on several issues that are currently the subject of widespread discussion and debate in the minicomputer field. We'll also cover minicomputer hardware in depth — including microcomputers being used in data processing systems. In all, you'll see a variety of applications stories and tutorials on topics like these:

- Programming languages for small business systems — commentary on languages that have the same name but because of the "improvements" added by competing vendors, may have wide variances in operating efficiency.
- How to evaluate technical evaluations — a look at what benchmark tests and product specifications mean.
- The evaluation and selection process — a case study.
- Minicomputer maintenance — analysis of possible methods (vendor maintenance, independent service organizations, and end user self-support) with an eye to cost savings.
- Minicomputers in distributed processing — stand alone and communicating.
- Using minicomputer equipment — including general purpose minis, small business systems, turnkey systems, miniperipherals and microcomputers.

If you're interested in finding new ways to make data processing more useful and cost effective throughout your organization, you should read our special report in our August 29th issue And if you're a mini manufacturer, OEM or systems house who's interested in telling potential customers how your equipment can help them in their jobs — advertise here. Your *Computerworld* salesman can give you complete details. But don't miss the August 12th ad closing date. Call Terry Williams at (617) 965-5800 to reserve space for your ad.

Computer Sales Professionals are invited to unveil a new career with the Sperry Univac BC/7 Business Computer

The Sperry Univac BC/7 is e brend new, inexpensive, easy to use business computer for the application systems solution marketplace that provides the power of a larga scale operating system. It's been just 4 months since the introduction of this fantastic product and already, the business community has rasponded with unprecedented demand for purchases, demonstrations and further information. We attribute this "boom" to our marketing stratagy involving ● top dollar edvertising ● diract mail campaigns ● seminars ● the Sperry Univac image ● a hustling, well-informad, well-trained sales force. Putting it mildly, our sales team is getting their fair share...why not get yours?

In order for tha BC/7 to echiave the stardom that is its destiny, we're focusing the spotlight on successful computer prolassionals like yourself.

To qualify for a spot on the BC/7 markating team, you'll need e proven treck record as a successful, embitious, hard working, strong closing computar sales professional. Managerial potantial would be a definite plus, because you'll be givan every opportunity to advance toward that direction if you so desire.

As far as compensation is concerned, our program is the envy of the industry. It consists of selary + commission + expenses + benefits. Our people do well here, and so will you.

You may naver again ba faced with an opportunity to essume an exciting new role that combines tha dynamics and growth potential of e new venture with tha solidarity of en established industry giant.

Openings in 20 Major Cities with Districts soon to be open in:

Advanced Software Design

Applications/Systems/Data Base Design

Telecommunications is one of the most rapidly growing segments of the software frontier. We have major projects underway now . . . forerunners of our long-term commitment to significantly advancing the state-of-the-art. We're working from definition and design through development and implementation in areas such as CAD, Data Base Systems, Simulation, Fault Recovery, Diagnostics and many areas of software design in an on-line, real-time environment

Software Design Engineers

We're looking for an indepth background in the development of systems software and a minimum of 3 years' experience in structured design, testing and documentation of programs running on large data base, multi-file systems in real-time. Familiarity with HIPO design documentation, TSO usage and software simulation techniques as well as PL1, Fortran and assembler languages for the 8080 and PDP 11 programming is also important.

Data Base Design

You will need a minimum of 5 years' experience in the planning, development, design and implementation of data base software, including data base management systems administration. Your primary responsibilities will be the development of data base system for a large on-going project including the implementation, support and administration of systems.

Computer Aided Design

We are looking for an extensive background in the design of CAD/CAM systems and the development of Interactive access by the users of CAD/CAM functions. Required is 5-10 years' experience in both hardware and software aspects; DA systems operations, and design, and systems engineering. Your initial responsibilities will include evaluation of existing systems, and working with a project team in the Architectural Planning of a major new system.

Mini-Computer Programmers

We have specific assignments available on project development teams responsible for the design implementation of various telecommunication processing systems utilizing mini-computers as the processing element. Responsibilities will include the development of software programs for real-time operating systems as well as unique hardware elements incorporated into the systems.

If you have in-depth expertise in one or more of these areas, a BS, MS or PhD in Electrical Engineering, Computer Science, Math or other appropriate engineering discipline and have an interest in moving forward with one of the challenging new frontiers in computer technology, talk with us.

SOFTWARE

We need more pros for our team

Right now. Today. We've got challenging jobs for computer software engineers with experience in:

- **Operating Systems**
- **Utilities**
- **Networks/Data Comm.**
- **Diagnostics**
- **Compilers**
- **Software QA**

We devote more development dollars to software than hardware. Because that's computing's future. Perhaps it's yours. We need creative people who can design Interdata software for use in business, laboratories, government and by OEMS around the world:

Join the team that's growing faster than the industry average of 35 percent . . . Interdata, where you can make it happen.

Call me, Bill Beattie, at (201) 229-4040 or send me your resume in strictest confidence. We are an equal opportunity employer with virtually unlimited opportunities.

PERKIN-ELMER DATA SYSTEMS
106 Apple Street, Tinton Falls, N.J. 07724 (201) 747-7300

SYSTEMS ANALYST

(Manufacturing Systems/Wholesale Distribution)

Are you looking for responsibility? Do you want a challenge? If so, act now.

We are seeking individuals to develop Wholesale Distribution Systems or Manufacturing Systems design for sales worldwide.

MANUFACTURING SYSTEMS

Our Manufacturing Systems Analysts will work with the systems development organization using data base structure techniques and provide systems support for manufacturing applications and related operating software.

Individuals should have a thorough understanding of manufacturing systems in an interactive or on-line environment with at least 3-4 years data processing techniques in a manufacturing environment.

WHOLESALE DISTRIBUTION

Our Wholesale Systems Analysts will work with a systems development organization employing the latest systems developing techniques and provide systems support for wholesale/distribution applications and related operating software.

Individuals should have an understanding of "HIPO" and/or other structured design and programming techniques with at least 3-4 years experience with data processing techniques in a wholesale environment.

Candidates for these positions should possess a BSCS, technical related degree or equivalent work related experience.

Let us hear from you! We will give you a quick reply. Send your resume with salary history to:

NCR

Mr. Max Anderson

Policy No. 14U/Upgrading for DATA PROCESSING Expansion

Career Assurance for:
SYSTEMS ANALYSTS & PROGRAMMER ANALYSTS

with insurance experience — with strong analysis background

Program

Our special upgrading and system expansion will offer Data Processing professionals a unique opportunity to work with some of the most sophisticated equipment in our industry. Current opportunities exist with our **PROPERTY/CASUALTY UNIT** for individuals with actuarial or statistical experience coupled with exposure in personal and commercial lines. Knowledge of information systems is a plus, but not essential.
Additionally, excellent openings exist with our **GROUP INSURANCE DEPARTMENT** for ambitious individuals possessing a life/group insurance background.

Terms

The above positions with our PROPERTY/CASUALTY and GROUP INSURANCE DEPARTMENTS will involve the analysis and design of new information systems. Applicants should possess experience in the design and installation of insurance systems.

Premiums

Qualified applicants will work in our new modern data processing center (cited by ABC News). Additionally, Hartford is ideally located in New England, offering four-seasons of recreational and cultural resources. Here, you'll find the quality of life equal to your expectations.

Dividends

The Hartford's continuous training programs will increase the scope of your EDP capabilities, pointing the way to senior systems analysis and supervisory and management positions. These openings in our PROPERTY/CASUALTY and GROUP INSURANCE DEPARTMENTS represent genuine challenges, advancement opportunity, a solid benefits package that includes a dental plan, and an incentive savings program.

THE HARTFORD

Computer Software Engineers

If you've just realized you're working on problems any engineer can solve, you're probably not just any engineer.

You're probably talented, creative, and ready for a step up to Kearfott. We have a long history of providing complex hardware/software problems that demand a great deal more thinking than the usual assignment.

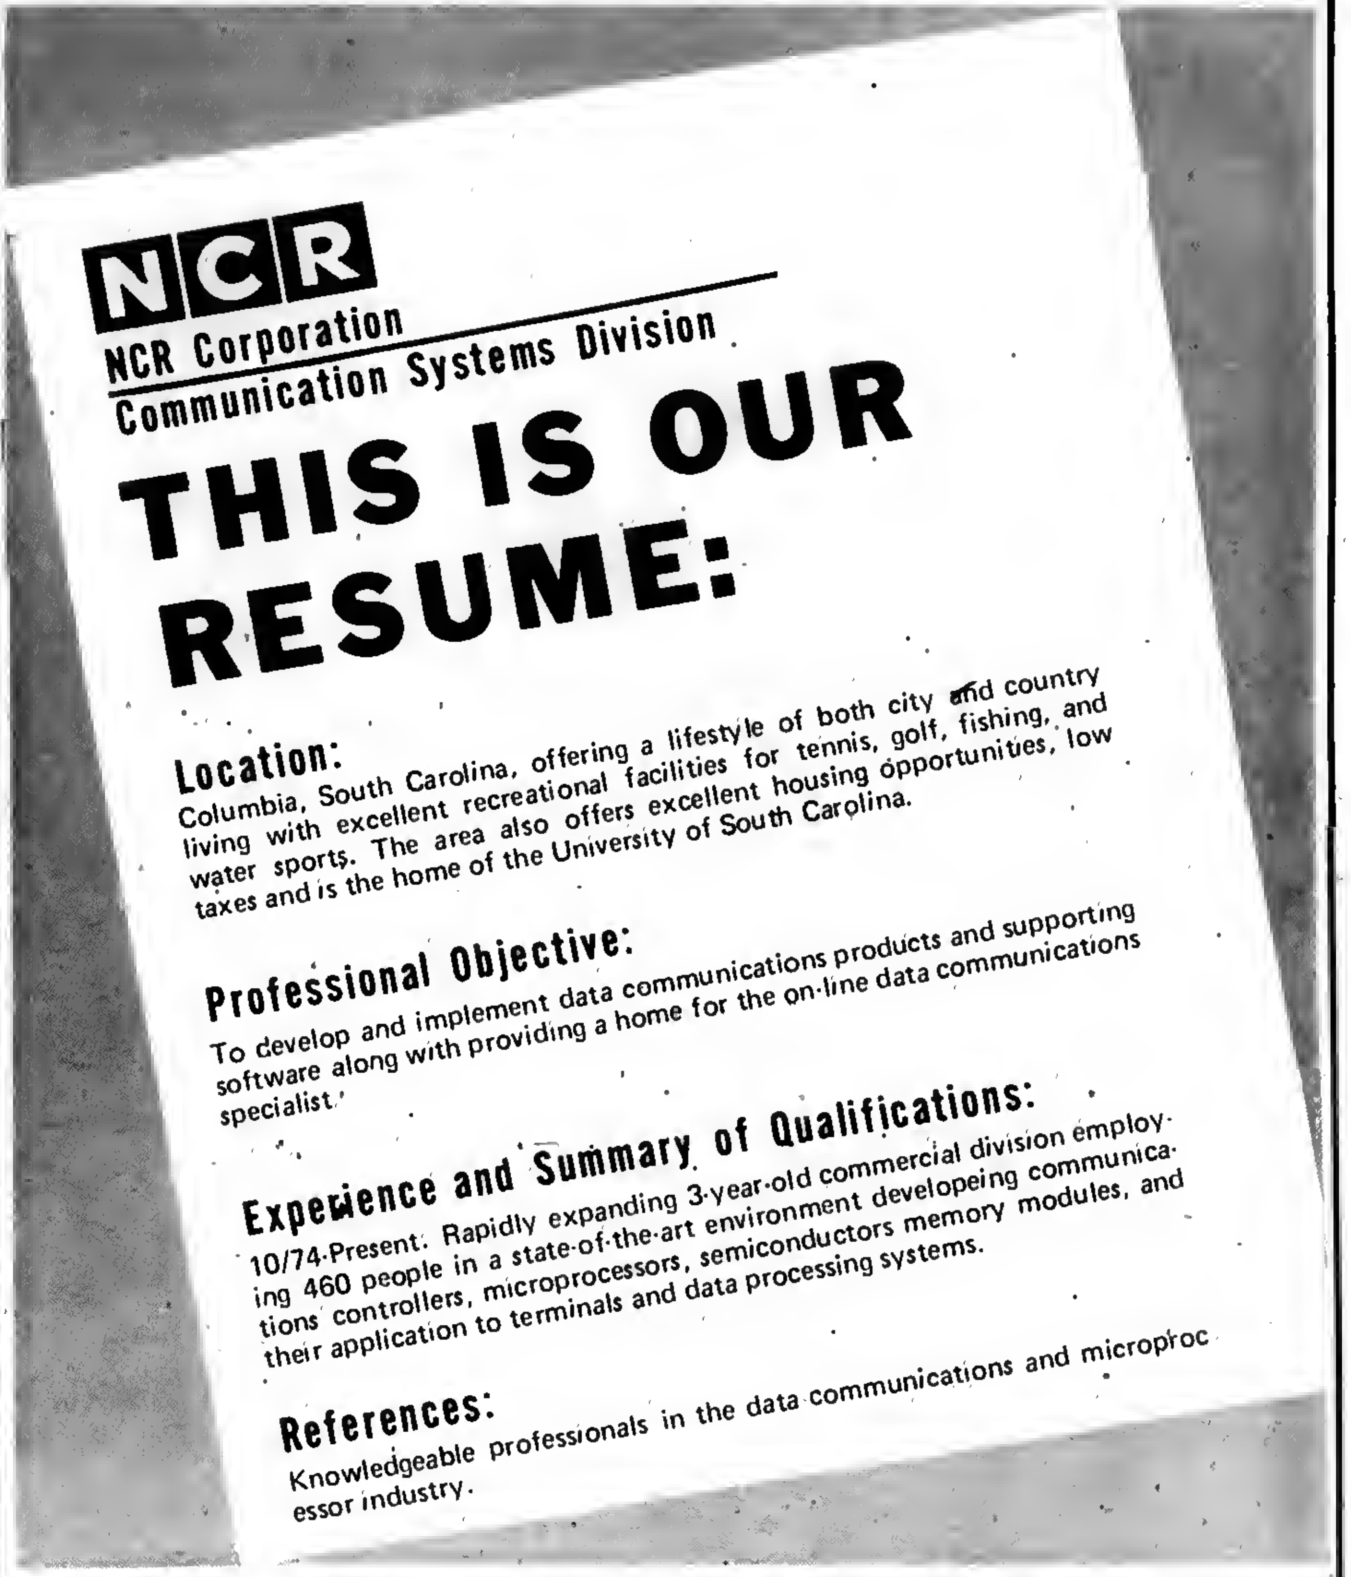
And there's more than a good chance we have a place for you on advanced projects in the guidance, navigation and control field — where you'll apply computer technology to one or more of the following:

- **Avionic systems simulation**
- **Realtime control of navigation and communications systems**
- **Automatic testing of avionic subsystems**
- **Airborne computer products**

You should be a computer software specialist with a degree in Engineering or Physics, at least 2 years' experience, and have the ability to communicate effectively with hardware professionals. We offer on-site MASTERS DEGREE programs in Computer Science and Systems Science . . . plus commensurate salary, comprehensive benefits, and solid opportunity to keep growing right along with your contributions. Apply now by sending your resume with salary history in strict confidence to: **Mr. J. DeGennaro, Singer Co., 1150 McBride Avenue, Little Falls, New Jersey 07424.**

Kearfott
a division of The SINGER Company

An Equal Opportunity Employer, M/F, Who Creates Opportunities.



NCR
NCR Corporation
Communication Systems Division

THIS IS OUR RESUME:

Location:
Columbia, South Carolina, offering a lifestyle of both city and country living with excellent recreational facilities for tennis, golf, fishing, and water sports. The area also offers excellent housing opportunities, low taxes and is the home of the University of South Carolina.

Professional Objective:
To develop and implement data communications products and supporting software along with providing a home for the on-line data communications specialist.

Experience and Summary of Qualifications:
10/74-Present: Rapidly expanding 3-year-old commercial division employing 460 people in a state-of-the-art environment developeing communications controllers, microprocessors, semiconductors memory modules, and their application to terminals and data processing systems.

References:
Knowledgeable professionals in the data communications and microprocessor industry.

NOW THAT YOU HAVE SEEN OUR RESUME, WE WOULD LIKE TO SEE YOURS ...

We are currently seeking qualified personnel with experience in any one of the following areas:

DESIGN ENGINEERS
- Processor design using MOS or bipolar bit slice devices
- Microprogramming
- Microcomputer diagnostic software
- State-of-the-art semiconductor memory design
- A/D to D/A conversion design
- Linear and digital circuit design

COMPONENT ENGINEERS
- Experience in memories and microprocessors
- Knowledge of characterization and qualifications requirements of LSI

MODEM ENGINEERS
- 1200 to 9600 BPS
- Design, application, evaluation, and production support
- Microcomputer systems

PROGRAMMERS AND SYSTEMS ANALYSTS
(Hardware/Software)

Openings exist in the following technical areas:
- Distributed network architecture
- Systems design
- Simulations
- Operating systems
- Real time systems
- Diagnostics and error recovery
- SDLC, asynch, bisynch disciplines
- Assembly language experience

If you are seeking a challenging career with a leader in the industry, require a change in your lifestyle and have the above experience, we would like to speak to you. A degree in engineering, math or computer science required. Recent graduates will also be given consideration. For immediate response, please send your resume with salary requirements in complete confidence to:

CSC

PROGRAMMER/ANALYSTS

AT CSC's SYSTEM SCIENCES DIVISION, YOUR OPTIONS ARE GREATER ....

Computer Sciences Corporation is a world leader in information sciences with more than 8,000 people working on governmental, commercial, and industrial projects.

CSC's System Sciences Division is creating more positions to meet project demands, offering you professional challenges and career choices commensurate with your ability.

Currently, we are expanding two projects: Our FAA assignment is to develop and implement air traffic control systems; and our NASA program supports three major projects. Professionals of all levels of experience are welcome to investigate opportunities now available in our organization.

AIR TRAFFIC CONTROL SYSTEMS

We are seeking experience on IBM 360/OS in any one of the following areas:

- Simulation of air traffic patterns. Knowledge of JOVIAL a plus.
- Design and implementation of data base management systems
- OS/360 System generation and maintenance
- Diagnostic design, development or enhancement and hardware orientation
- Software test and validation including development of tools to test and validate real-time software systems.
- Software Quality Assurance

BAL and/or high level language (preferably JOVIAL) experience highly desirable.

Positions are located in Jacksonville, Florida.

SPACE SCIENCES

Current positions in support of our Goddard Real-Time System, Space Tracking Data Network and On/Off Site Project for the NASA Goddard Space Flight Center require a degree in Computer Science, Math, Physics, Astronomy, Meteorology or Engineering with experience using FORTRAN and/or Assembly languages on large-scale or mini-computers. These skills will be applied in the following concentrations:

- Telemetry application with multi-computer configuration
- Integration and testing of real-time display software
- Data base management
- Real-time scientific applications
- Network management
- Computer-to-computer communications
- System requirements definition
- Analysis and application of climatological data
- Simulation/modeling of real-time systems

CSC offers a liberal relocation policy in addition to a complete benefits package. For immediate consideration please send resume or call:

COMPUTER PROFESSIONALS MVS JES-3 CICS

Our continued strong commitment to the development and installation of sophisticated financial applications and software techniques creates a number of positions which are available in our information services department. We are searching for those computer professionals who desire to join a team which will remain leaders in our industry.

PROJECT MANAGERS

Individuals will be responsible for the overall direction of the various disciplines required in the design and implementation of financial and business systems. Involvement with design of EDP systems and project management of at least 5 years is required. Formal training in computer science an advantage and may be substituted for some of the experience requirements.

SENIOR PROGRAMMER ANALYSTS

ANS COBOL experience of at least three to five years in a business or financial environment is essential. We desire familiarity with: OBMS, DB/DC, CICS, ALC or file access methods. Experience with hierarchial design will be helpful. Will be assigned to complex projects of design and implementation. Excellent communication skills necessary because of heavy user contact.

PROGRAMMER ANALYSTS

Requires fluency in COBOL and background including IBM 370 using MVS and OS/JCL. These individuals must have a system background of at least two to three years. Also must be capable of involved and complex system and program design. Excellent communications skills important. On-line program development experience a plus.

These are positions which will require individuals who are willing to accept unusual challenge and responsibility. We offer involvement in one of the most progressive sites in the industry. Compensation will be commensurate with background. We offer competitive benefits and a very desirable Western New York location. Please send resume including salary history and requirements to: Robert J. Woeppel, Manager - Employment, Marine Midland Bank, One Marine Midland Center, Buffalo, New York 14240

MARINE MIDLAND BANK
An Equal Opportunity Employer M/F

PROGRAMMERS/ANALYSTS

The Dayton area's largest and most progressive financial institution has openings for experienced Programmers and Systems Analysts.

Two years NCR NEAT/3 or NCR COBOL experience desired. Experience with CIF, CIRF and/or commercial bank applications preferred.

We offer an excellent starting salary plus an outstanding fringe benefit program. Send resume to:

MANAGER DATA BASE ADMINISTRATOR

$28,000 to $34,000

Our client a medium sized insurance company located in Rhode Island is seeking a Data Base Manager to direct the following functions: define the content and organization of the data base; document the data base and the usage of data therein; monitor its usage; assure the security and integrity of the data base; become and remain aware of business and MIS plans as they affect the data base; assist in design of business systems; evaluate technology and supervise its application. Ideal candidate must not only have excellent credentials and accomplishments in data base technology but also a strong business orientation.

DATA BASE MANAGER

$30,000 to $35,000

Multi-billion dollar manufacturing company located in Northern New Jersey is seeking a data base manager to assist in the start up operation of a data base under IMS/VS. Must have practical experience in IMS/MVS. DB/DC. Ideal candidate should be a team player since he will play an integral part in putting together the data base group and in determining the direction the company will go.

QUALITY ASSURANCE POSITIONS

Harris Corporation, Computer Systems Division, has the following Quality Assurance positions available in our Fort Lauderdale location.

QUALITY COMPONENT ENGINEER

Will be responsible for component evaluation as related to quality requirements. In addition, vendor evaluation and liaison will be required of the successful applicant. Experience is required in failure analysis and incoming inspection support in the areas of IC's, semiconductors, passive components, PC boards, and electro-mechanical assemblies. A BSEE with 4-7 years experience in the computer industry is desirable.

RELIABILITY ENGINEER

Will be responsible for reliability engineering and analysis. Will make assessments on design as they relate to product reliability. MTBF and MTTR predictions as well as statistical analysis of component and equipment life characteristics are required. Emphasis will also be placed upon failure analysis. BSEE plus 3-5 years' computer industrial background is required.

SUPERVISOR-LINE INSPECTION

The successful candidate must be knowledgeable and experienced in Quality Assurance and assembly operations inspections. Responsibilities also include supervision and inspection of computer and related electronics. We require a minimum of 3 years' of supervisory experience in the above area.

The above are growth positions and are expandable towards higher management responsibility within our division.

Send your updated resume in strictest confidence, along with current salary information, to Mr. George Mikus, Harris Corporation, Computer Systems Division, 1200 Gateway Drive, Ft. Lauderdale, Florida 33309.

SENIOR SYSTEMS ANALYST

Innovative individuals thoroughly experienced in computer based system design principles, data based concepts and sound COBOL programming practices, to formulate solutions to business problems through the use of information processing systems. Responsibilities include feasibility studies, general design, development and installation. A degree, minimum 4 to 6 years experience and excellent verbal and written communication skills are necessary.

SENIOR SOFTWARE SPECIALIST

Individuals should have 3 to 4 years experience in HASP, DS/MVT, VS1, VS2 and IMS. Will be responsible for maintenance of all operating system software and providing technological guidance to data processing staff. Experience in maintaining complex IMS environment is a necessity. Degree is required.

SENIOR PROGRAMMERS

Successful candidate must possess degree in math, computer science or related field and have 4 to 5 years experience with ANS COBOL. IMS experience would be helpful.

DATA BASE ADMINISTRATOR

The successful candidate will operate in an IMS environment where the accent is on advanced technology. 3-4 years experience in IMS with a minimum of 2 years as Data Base Administrator utilizing DB/DC. Will be responsible for Data Base design as well as serving as consultant to applications development staff.

SENIOR COMPUTER OPERATORS

Individuals must possess 2-3 years experience in an D/S MVT or VS environment. Telecommunications experience via CICS or IMS would be helpful.

All responses will receive a reply. Interested parties should send a resume to:

CW Box 5126
797 Washington St.
Newton, Mass. 02160
An Equal Opportunity Employer M/F

Koreans Hit in Theft Of Millions in GI Gear

By Edith Holmes
CW Staff

WASHINGTON, D.C. – A Retired U.S. Army officer charged here recently that South Koreans, with the help of Americans and a computer system, have been stealing up to $17 million in U.S. food, uniforms, vehicle parts and other supplies each year since the early 1970s.

The diversion of American supplies continues today "at the same or slightly reduced level," Lindsay L. Baird Jr., a retired lieutenant colonel who served a year as provost marshal for the Army's Second Infantry Division in Korea, said in a letter to the Senate's Committee on Government Operations.

In response to the publication of Baird's five-page letter in *The New York Times*, the Department of Defense (DOD) elaborated on its mid-July comment that it was "investigating alleged improprieties in South Korea."

DOD's overall inquiry will include an examination of Baird's charges, a DOD spokesman added last week.

According to Baird, Korean organized crime, the Korean military and Korean contractors, politicians and police – as well as American enlisted men – had a hand in the manipulation of the U.S. Army's inventory control, centered at Taegu, Korea.

Koreans Used U.S. System

South Koreans used the Army's logistics system, which runs on a Univac 7060, to order, move and store at convenient locations items earmarked for theft, Baird said in his letter and in an interview with the *Times*. When the property was stolen, records of its existence vanished.

Food was stolen every Monday, Wednesday and Friday and, in one instance, $103,000 worth of field uniforms was diverted, the former provost marshal reported.

The Korean railroad billed the Army for goods that had not actually been transported or for materials that had been moved but not recorded on bills of lading because they were "destined to be stolen at the final destination," Baird said.

Baird, who retired from the Army in 1973, served as provost marshal for the Second Infantry Division from mid-1971 to mid-1972. He was in charge of a larceny squad that looked into theft and corruption in Korea.

The Army has investigated the matter in the past, he stated. In late 1971, a meeting of top Army officials put U.S. supply losses in Korea at $27 million to $28 million a year, he added.

Control procedures were established and more Americans were assigned to the Taegu computer center, he said. The Taegu operation, however, was "primarily staffed with Koreans who

TORONTO – Getting here was half the fun.

Ingenuity and perseverance were the two traits required by many attendees of the International Federation for Information Processing's (Ifip) Congress 77 as an air traffic controllers' strike closed all Canadian airports the day before the conference started.

Attendees could be divided into two classes: those who had problems traveling to Toronto and those who didn't.

And then there were those who didn't arrive at all. The Ifip organizing committee indicated there were about 200 persons who had preregistered but not arrived as of last Wednesday.

The conference proceeded largely as scheduled, with only a few papers assigned a later time for presentation.

Although many of the attendees from Europe were already in North America before the strike began a week ago Sunday, some still had to exercise their ingenuity to reach Toronto. Those who learned of the strike while in transit faced nightmarish reroutings involving trips of up to 35 hours.

Hans Kristia Eckhoff of Rogalandsdata AS in Stavanger, Norway, said he

TORONTO – The sixth triennial congress of the International Federation for Information Processing (Ifip) here last week attracted about 9,000 DP professionals from all over the world.

Delegates from more than 50 countries attended the technical program, which included 100 papers, 90 sessions and 30 mini symposia and panel discussions. More than 20 international authorities on computing presented invited papers as part of the technical program.

The Congress 77 exhibition featured over 100 companies, research agencies and other DP organizations displaying their products and services. Congress 77 also included the Second International Medinfo Conference dealing with the use of computing and medicine and the second world computer chess championship tournament.

The Ifip Congress in Toronto marked the second time the international conference, founded in 1962, has been held in North America; the first was held in New York in 1965.

Social issues received considerable attention at the conference late in the

Mass. Nixes EDS Contract

By Ann Dooley
CW Staff

BOSTON – Contract negotiations between the state of Massachusetts and Electronic Data Systems (EDS) ended here last week, after Gov. Michael S. Dukakis intervened to halt the dispute over a $23 million state contract.

The contract involves a five-year facilities management agreement to reorganize and expand the Department of Administration and Finance (A&F).

The controversy erupted when it was discovered that two officials of Sci-Tek Associates, a Massachusetts firm, were on the contract selection committee at the same time Sci-Tek was working with EDS on a $1.6 million contract in Tennessee.

Dukakis called a halt to the negotiations after an advisory opinion by Attorney General Francis X. Bellotti found Sci-Tek's double role in the EDS selection and its involvement with EDS in Tennessee apparently violated state conflict-of-interest laws. The investigation was done at the request of A&F Secretary John R. Buckley, whose office conducted the selection process.

The governor said the contract to computerize the state's budgetary, accounting and payroll records is "too

But What Policy?

Lance: OTP to Retain Policy Role

By Edith Holmes
CW Staff

WASHINGTON, D.C. – The Office of Telecommunications Policy (OTP) will continue to have a role in telecommunications "policy development" after it moves out of the White House and into the commerce department under President Carter's federal reorganization plan, Bert Lance, director of the Office of Management and Budget (OMB), said at hearings here recently.

But Lance did not specify what areas that policy development would cover, and that left Capitol Hill observers divided on the import of his statement.

Some felt Lance meant OTP will continue to provide policy guidance in the same areas it has in the past – the structure of the communications industry, regulatory policy regarding common carriers and regulatory approaches to new technologies.

Others, including Sen. Ernest Hollings (D-S.C.), and Rep. Lionel Van Deerlin (D-Calif.) – believe Lance's remarks supporting "Reorganization Plan No. 1" contained no positive statement of the functions OTP will perform under an Assistant Secretary for Communications and Information in the Commerce Department.

Shouldn't Worry

Informal Meetings between the White House and Congress suggest the Senate Subcommittee on Communications, chaired by Hollings, shouldn't worry about the continued importance attached to OTP, communications and information policy, a subcommittee spokeswoman said.

"But we're still waiting to see something on paper from the White House," she added.

One reason Lance gave for moving OTP from the White House to Commerce was considered both "ominous" and vague by at least one observer. "The functions of OTP are important, but, as presently performed, do not require Presidential attention," the OMB director stated.

Appearing before the House Government Operations Committee's Subcommittee on Legislation and National Security earlier this month, Lance repeated the President's statement that, with the exception of the federal government's procurement of telecommunications facilities and services, agency squabbles over allocations of the radio spectrum and policy options requiring Presidential decisions, OTP will take "all other functions" with it to the Commerce Department.

Those "other functions" include communications "policy development and the allocation and regulation of frequency assignments," he said.

OTP's Origins

OTP came into being with former President Nixon's 1970 reorganization plan and had its functions specified in Executive Order 11556 of Sept. 4, 1970. The U.S. Government Manual describes OTP's functions from that point on as developing policy in such areas as communications industry structure; communications goals in international negotiations; common carrier services; and new technologies, including satellites, cable television and interconnection of computer systems.

Optimistic observers believe Lance's reference to "other functions" in his presentation to the House subcommittee, chaired by Rep. Jack Brooks (D-Texas), suggested OTP will continue to carry out these tasks as part of Commerce.

They also expect the telecommunications organization will still establish policies and standards for federal communications systems and guide the government's research and development efforts in this area, as discussed in the federal manual.

The President had already stated that under an Assistant Secretary for Communications and Information in the Commerce Department, the reorganized OTP would continue as the Administration's spokesman on telecommunications and would still assess the economic consequences of "information policy" [CW, July 25].

Lance confirmed that Assistant Secretary position will be a new post, separate from Commerce's Assistant Secretary for Science and Technology. He also stated that those OTP functions transferred to Commerce will be merged with the Department's Office of Telecommunications.

The OMB director explained that the President views the transfer of OTP responsibilities to Commerce as a consolidation of the treatment of telecommunications issues within one agency.

"The designation of a new Assistant Secretary would signal the importance of telecommunications issues within Commerce and provide a single spokesman for telecommunications issues within the Administration," he told Brooks and the subcommittee.

"Additionally, the growth of the information section of the economy, the expansion of telecommunications and DP technology and the creation of new industries in this area make it essential that economic consequences of information policy be adequately assessed," Lance said.

The transfer of OTP functions to the Commerce Department is consistent with Carter's commitment to strengthening Cabinet government, he noted.

Fianlly, Lance contended that OMB's role in computer and information system procurement makes it appropriate that the budget agency take on telecommunications procurement as well. OBM "provides a neutral home for this function," he said.

Brooks noted in his opening statement that Carter has until Sept. 15 to change or clarify his plan. Under the requirements of the Reorganization Act, which gives the President reorganization powers, Brooks has introduced House Resolution 688 expressing disapproval of Carter's first plan.

QUESTION

If 13 of the 15 most profitable U.S. companies use SyncSort, can you afford to be without it?

Call (201) 568-9700

for a free six-step sorting survey.

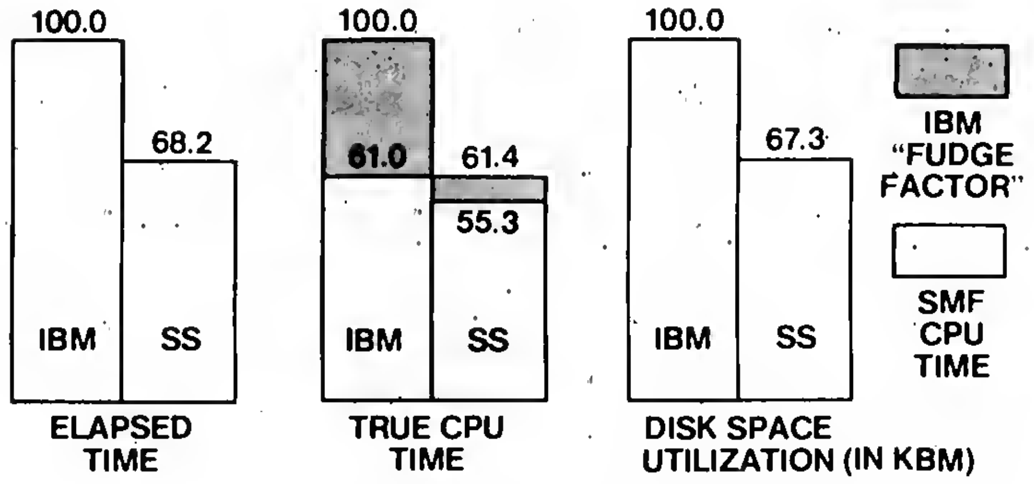
One thing that makes us particularly proud of SyncSort is the company it keeps—and the companies that keep it.

A glance at the list below will show you the source of our parental pride. These are the 15 most profitable companies in America, as selected by the Forbes Magazine Profits 500 list:

RANK	COMPANY '76
1	**American Tel. & Tel.**
2	**General Motors**
3	**Exxon**
4	**IBM**
5	**Ford Motor**
6	**Mobil**
7	**General Electric**
8	**Standard Oil (Ind.)**
9	**Standard Oil (Calif.)**
10	**Texaco**
11	**Gulf Oil**
12	**Shell Oil**
13	**Sears, Roebuck**
14	**Eastman Kodak**
15	**Dow Chemical**

Thirteen of these winners—we're sorry we can't identify them—sort with SyncSort. And we don't think that's just pure coincidence. All of the 13 have benchmarked SyncSort against competitive sorts, on their own files, and they've simply come to the conclusion that our sort sorts best.

If you'd like to do the same, we'll be glad to oblige you. Just give us a call and we'll arrange a free sorting survey, the highlight of which is the benchmark. If you want to compare SyncSort against, say IBM's SM1-5740, Release 3, on your files, under exactly equal conditions, you can expect savings in computer resources that look like this:



A fourteenth name on the list is going through the SyncSort testing phase right now, and any day we hope to be able to announce that we have 14 out of 15.

Will we ever get all of them? Alas, probably not. A glance at name No. 4 will tell you why.

IBM, you may soon be the only company on the "most-profitable-15" list that *doesn't* sort with SyncSort!

Micro Programmers Seen Facing Old Problems

By Molly Upton
CW Staff

TORONTO — Programmers of microcomputers are being asked to leap backward 25 years and repeat all the mistakes of the early programmers, E. Dijkstra told the International Federation for Information Processing's (Ifip) Congress 77 here last week.

"Microcomputers are not great," Dijkstra stated at a session entitled "The Impact of Microcomputers on Computing," attended by about 800.

Just as programmers once struggled with early computers to squeeze as much as possible out of the limited-capacity machines — when "all dirty tricks were permitted," — so today's programmers of microcomputers are struggling, Dijkstra said.

Eventually programmers learned that "good taste and a systematic mind" were greater assets than the initiative to take short cuts since these traits resulted in greater reliability, he said.

Citing the "confusing nature" of computing, Dijkstra said a quarter of a century ago "we were told computers were great because they were expensive. Now we are told micros are great because they are cheap."

Dijkstra however, raised several concerns about micros, among them the problem of deciding how to distribute the computing load over a large number of processors and the problem of organizing different processors.

"With micros, users should be prepared for "very unreliable output," he said. "Even if the design is flawless, how can we convince ourselves the quality control is really there?"

He expects the chip manufacturers to adopt the same philosophy as the auto makers: Leave the quality control to the consumer. "We are forced to assume the chip is perfect unless the customer complains," he said.

Multiple Micros Urged

Dave Aspinall of Great Britain advocated the use of multiple micros in a system, but admitted it will be quite a while before supercomputer design efforts are impacted by the large-scale integration (LSI) type of device.

Rather than devising a monolithic, sequential device, designers should admit micros are cheap, use lots of them and connect them properly to achieve a solution, he said.

His analogy between a percussionist in an orchestra and a dedicated micro — "a composer doesn't worry that the percussionist is idle most of the time" — drew hearty laughter from the audience.

Anatole Holt, director of research at Massachusetts Computer Associates, explained the user's view of micro as a remarkably cheap, remarkably portable unit with substantial informational power is causing the user to want to eliminate the expensive middle person, the programmer, and use it directly.

Concern Over Standards

I. Barron of Microcomputer Analysts Ltd., chairman of the session, urged the computer industry to be very concerned with the evolving standards and architecture of microprocessors.

Although micros are "poorly designed, inefficient in their use of storage and difficult to use," the trend is toward increased use of them, he said.

Barron pointed to the "clear momentum to standardize" micros and indicated time is running short before "fossilization" sets in. "Does it matter to the computer industry what the microprocessor looks like?" he asked.

His opinion was a definitive yes, citing how the industry had become stuck with the teletypewriter, an inappropriate, slow device whose use was pervasive because of its cost.

Barron expressed fear that the semiconductor manufacturers will implement longer word lengths rather than better architectures. What is really needed is a 4- or 5-bit word length, he said.

The 8-bit word length is "very silly" and very inefficient for representing the sort of information we use — English with some numbers, he said. A more effective coding system using a character set of 4 or 5 bits could halve the cost of electronics, he added.

Citing the demand for simplicity and clarity in computing, Barron said a 30% to 40% reduction in the size of programs might be possible if one went directly to a microprocessor that accepts high-level language..

Koreans Charged in Theft

(Continued from Page 1)

were supervised by a relatively small number of Americans."

"The Koreans knew everything about the systems while our people did not," he wrote.

The Army's own logistics system facilitated the rip-off of the computerized inventory, Baird said. Under Army procedures, as goods move from one point to the next, the main responsibility for keeping records on them moves with them. The lack of comprehensive records in some other location made it easier for the crime ring to develop false records at Taegu, he explained.

In other instances, Baird said, the computer system was simply used by the Koreans as a source of information about the size, destination and contents of supply shipments.

Baird, now a DP consultant to private industry, wrote to the senate committee after it published its staff report on computer crime entitled "Problems Associated With Computer Technology in Federal Programs and Private Industry," early this year.

At the end of June, as a result of the staff study and hearings held by the Senate Government Operations Committee, Sen. Abraham A. Ribicoff (D-Conn.) introduced a computer abuse control bill designed to levy heavy prison terms and fines on criminals using computers to steal or manipulate information [CW, July 4].

A companion bill has since been introduced in the House of Representatives by Representatives Charles Rose (D-N.C.) and Robert Drinan (D-Mass.).

The Senate Government Operations Committee plans no further investigations into computer crime — including the alleged South Korean thefts — at the present time. "The investigation is already completed, and we have demonstrated a need for computer crime laws," a spokesman for Ribicoff stated.

The key issue in the Baird account of the Korean thefts is not computers, but spare parts, he continued. "That's the real scandal."

A spokesman for the Korean Embassy here said the Baird allegations were "malicious lies not worthy of further comment."

X.25 Protocol Used

Exhibit Features International Pack Net Link

By Ronald A. Frank
CW Staff

TORONTO — The international interconnection of packet-switched communications networks was demonstrated as an operational reality here last week at the International Federation for Information Processing's (Ifip) Congress 77.

The exhibition featured a transatlantic link between the Canadian Datapac network and the French RCP net. The interconnection was implemented using the X.25 protocol recently approved by the Consultative Committee on Interactive Telephone and Telegraph (CCITT).

The demonstration was the result of a cooperative interface between the French Postel, Telephone and Telegraph (CPIT) authority, Teleglobe Canada and the computer communications group of the Trans-Canada Telephone System.

CRTs from Honeywell Information Systems, Inc., Westinghouse, General Electric and others on the exhibit floor were connected to the Datapac net elsewhere in Toronto. Messages were transmitted over the Datapac net to an X.25-compatible gateway set up by Teleglobe Canada.

From the Teleglobe interface, another gateway was established by the French PTT which also interconnected with the RCP network.

In one international connection, Derek Barber, director of the European Informatics Network (EIN), sent a message to his office in England by interfacing four major packet networks. From a CRT at the exhibition, Barber sent a message over Datapac and through the RCP net in France to an interconnection with the EIN system, which in turn was interfaced with the net of the National Physical Laboratory in Teddington, England.

CW
At Ifip

The French PTT used the transatlantic link to demonstrate the RCP net and Iria, the French research institute, demonstrated several applications on the Cyclade network, which utilizes the Cigale system as its packet-switched transmission medium.

The Cyclade applications shown at the exhibition included a chemical data bank called Thermodata running on an IBM 360/67; Santal, a data base developed with the French Red Cross to compile information about hemophiliacs; a documentation system of the European Space Agency running on a 360/65 near Rome; and the Scrapbook file management system operating on the NPL network.

CII-Honeywell Bull participated in the Cyclade demonstrations with terminals connected to its DP center in Paris, where an HIS Series 60 Level 66 was operating. The company also used the terminals at the exhibition to access Iris 80 and Iris 50 systems installed at customer sites.

The French RCP network is the forerunner of the Transpac public packet network, which is scheduled to become operational next June. The Cyclade network, which became operational in 1973, currently serves scientific, academic and research users as well as government agencies in France.

French officials said it has not yet been determined whether a permanent interconnection will exist between Cyclade and Transpac.

Governor Calls Halt to EDS Bid Award

(Continued from Page 1)

important and too big a job to be tainted by any hint of conflict-of-interest."

A further investigation by a state advisory committee is continuing to "prove or disprove the existence of substantial violations" and to "determine whether further civil or criminal proceedings" are indicated, according to Bellotti.

Although the contract is being put out for new bids, Dukakis said Sci-Tek would play "no further role." To date, however, the small firm has obtained five other separate contracts from the state amounting to more than $1 million.

James Corkery, co-owner of the firm, stated that an appearance of conflict of interest evolved because of delays in the Massachusetts contract selection process.

But the advisory committee found two of the delays occurred "because of the inability of Sci-Tek individuals to attend" selection committee meetings.

Sci-Tek official Robert Orr could not attend the final selection meeting since "he was in Memphis discussing the project there with Memphis officials and an EDS representative," according to advisory committee reports.

During the first phase of the bidding, the EDS proposal was ranked lowest technically of five bidders, according to Bellotti. The EDS bid was also $3 million higher than a proposed from Computer Sciences Corp., a competing bidder, acording to the firm.

At some time in the selection process, EDS rose from last to first place, Bellotti said.

"The substantial improvement in EDS' rating by the Massachusetts selection board following the Memphis negotiations creates, at a minimum, an appearance of improper influence. Thus, even without a further investigation, the provisions of the conflict-of-interest law appear to be violated," he said.

The two Sci-Tek officials' actions "suggest possible violations of several criminal provisions of the conflict statute," he said.

The conflict of interest could be considered illegal "as long as EDS agreed to the subcontract arrangement in order to 'reward' Sci-Tek for the favorable Massachusetts vote," the advisory said.

"It is critical to ascertain whether EDS made some commitment to Sci-Tek . . . as a quid pro quo" on the state contract, according to the advisory committee.

"Evidence of an unmerited shift in EDS' rating" would indicate a violation, according to Bellotti.

The investigation will either prove "opportunity for collusion" or "that [the Sci-Tek officials] are guilty of nothing more than poor judgment in allowing the appearance of impropriety to flourish," he said.

DEALERS...AJ WANTS YOU

Anderson Jacobson, a leading manufacturer of data communications products, would like to introduce you to our new minicomputer, the AJ System 1500. And we need your expertise to make our small business system successful.

Here's what we have to offer:

- Good margins
- Exclusive territories
- A small business nucleus of application software at *no charge* to you
- Excellent client accounting software, also at *no charge*
- A multi-programming, multi-terminal system that is *fully* expandable
- AJ field service available in selected areas of the United States
- Floppy or hard disk systems

If your are interested in being a part or AJ's successful future, call or write Bob Reed, National Marketing Manager, for more information.

Control Urged for Technology-Caused Change

(Continued from Page 1)

of Canada, a 25-member committee of university and industry representatives established to advise both government and industry, said all nations must give top priority to controlling the changes that flow from technological innovation.

It is necessary to anticipate the consequences as well as the potential of technological innovation and implementation, he said, adding that not all change is good and that today's boon may be tomorrow's disaster.

Although Kates characterized the computer revolution as "more benign" than perhaps the fast breeder reactor or recombinant DNA technology, he said it is critically important to understand the nature of the revolution that computers are creating, as well as what this means to individual countries and the world as a whole.

Computers have a bad image, he said, because people think they approach problems in a cold-blooded, calculating, mechanical way. While this view is unjustified, it does point to two important problems.

First, the public needs to be better informed about scientific developments; second, scientists and technologists have to take more seriously their responsibility to understand and to communicate to others the social, economic and philosophical implications of their discoveries, Kates said.

Computer technology is already famous for the way it can replace human workers and thus contribute to improved industrial competition, he pointed out. However, those displaced workers sometimes find themselves unemployed and on welfare, so a clever application of computer science may have added nothing at all to the human estate, according to Kates.

There also has been a tremendous development of potentially important weapons such as data banks and computer models which have not been used to combat Canada's and other countries' economic problems, he said.

The phenomena of boom and bust, stagflation, regional disparities and so on are an enigma, although the productive potential to address them does exist, he said.

"It is clear the evolving new world order will be seriously affected by the extent to which countries control or own the technological know-how on which their economies depend," he said.

The largest industrial countries are bound to develop leadership positions in the new technologies. The small and middle power countries can still compete, but in highly specialized areas, he said.

Computers have already helped Canada develop its resources and bring its population centers closer together with better communications, and computer technology can contribute much to the goal of saving energy, he said.

Some of this technology probably should be imported, but much can be improved here, too — developed for adaptation to Canadian conditions — such as the requirement for more heating and cooling, more transportation and communications and more energy for industries.

Canada is still in the process of nation-building and of creating the capability to play an effective, interdependent role in the world community. Innovations such as those in the computer field are perceived as engines of change that must contribute to this process.

The Science Council advocates "technological sovereignty" as the prescription for Canada's difficulties in ensuring an interdependent status in the global community, Kates said.

CW Photo by M Upton

Josef Kates

"Middle powers" like Canada can become more technologically interdependent by developments in software, which will lead to employment of a kind that challenges the intellectual abilities of a large portion of Canada's population.

The reduced dependence on capital investment that this involves, together with microprocessor technology and large-scale integrated circuitry, poses an exciting challenge to the large multinational companies that have so far dominated the computer industry.

Toronto Trip a Challenge

(Continued from Page 1)

and about seven other Norwegians were notified of the strike by American Airlines at their hotel in New York City.

The only flight they could get was to Rochester, N.Y., where they rented two taxis and headed for Toronto. The taxi drivers had never been further than Buffalo, so Eckhoff did the navigating.

Rogalandsdata is a service center for municipal governments.

Dr. Filberti Fiumi of Siemens in Milan, Italy, arrived in Toronto Saturday, two days before the conference opened, and encountered no problems.

But Meczyslaw Bazewicz of the Technical University in Wroclaw, Poland, was on a plane that was diverted to New York City. He was bussed to Toronto.

The journey took 24 hours and Bazewicz arrived at 1 P.M. last Monday, after the conference had opened.

Rolf Hoyer of the University of Goteborg, Sweden, arrived in New York City a week ago, last Thursday and drove as planned to Toronto in order to see some of the countryside.

Manfred Mall of Dornier System GmbH in Friedrichshafen, W. Germany had perhaps one of the most time-consuming journeys to Ifip. He started in Copenhagen 35 hours before reaching Toronto.

In London the airport was crowded with people standing around while planes were delayed. Mall arrived in Detroit at midnight Sunday and was bussed to Toronto, arriving at 7 A.M. Monday.

Carl Page of Michigan State University said he drove, as he had planned, from East Lansing.

Harold Borko of California said his wife had difficulty obtaining a flight from NYC to Buffalo. When she did, the bus from Buffalo blew a tire.

Robert Nell of the Saskatchewan Computer Utility in Regina, Canada, heard about the pending strike the night before it happened and arranged to start his journey with a flight from Minot, N. Dakota that left at 6:20 A.M. on Sunday. He and some colleagues left Regina for Minot at midnight and arrived just in time for the plane because they had forgotten Minot's time is an hour earlier.

After a six-hour layover in Chicago, Nell arrived in Buffalo. But his problems were not over.

He boarded a very old bus which, after an hour or so of driving, headed back to Buffalo because neither the driver nor any of the passengers knew the way to Toronto. Nell arrived at his Toronto hotel at midnight Sunday, 24 hours after he started from Regina.

Ifip Pulls 9,000 From 50 Nations

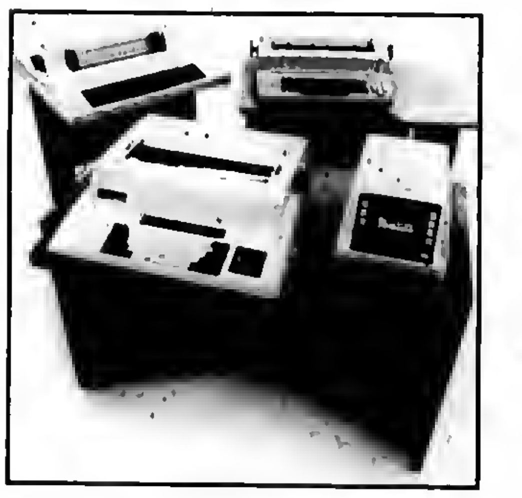
(Continued from Page 1)

week with five panel sessions covering such topics as the social accountability of computers, the impact of computerization on leisure activities and the erosion of privacy. Social issues related to computing first appeared on the Ifip program at Congress 74, held in Stockholm, Sweden.

The Congress 77 program also included a science theatre that presented movies and videotapes described as representative of the state of information processing today. The science theatre stressed the theme of Congress 77, "The Maturing Profession — Perspectives and Prospects."

Ifip is a federation of 34 national DP societies organized to promote information science and technology. During Congress 77, Pierre Bobillier of Switzerland was voted incoming Ifip president, replacing Richard Tanaka of the U.S.

Ifip Congress 80, the next meeting of the federation, will be jointly hosted by the Information Processing Society of Japan and the Australian Computer Society. Slated for October 1980, the first week of the conference will be held in Kyoto, Japan, and the second week in Melbourne, Australia.



They love me...they love me not...

Terminal manufacturers can be very fickle. Warm and tender when they write the order, most grow cold and unresponsive when you need service or repairs.

Trendata doesn't care for love-hate relationships. We're looking for something more meaningful, more fulfilling. So we offer you no-cost terminal evaluation, nationwide service by our representatives (not someone else's), one of the broadest range of terminals and peripherals available, and a wide variety of purchase, lease and rental programs.

And because our customer affection is boundless, we offer you all the supplies and accessories you need—ribbons, type elements, tape cassettes, copy holders, acoustic cabinets and forms stackers.

If you're having trouble communicating with your computer or computer terminal representative, call or write Trendata for a rendezvous.

AN APPLIED MAGNETICS COMPANY

U.S. Team Captures Crown As World DP Chess Champ

By **Ronald A. Frank**
CW Staff

TORONTO — A U.S. chess team from Northwestern University became the new world champion last week after trouncing 15 other competitors at a tournament held as part of the International Federation for Information Processing (Ifip) Congress 77.

Playing on a Control Data Corp. Cyber 176 mainframe, programmers David Slate and Larry Atkin captured the crown with their Chess 4.6 entry.

The world chess competition began in 1974 at the Ifip Congress in Stockholm, Sweden, when the Russian program Kaissa came in first. Kaissa was written at the Institute for Systems Studies in Moscow by Dr. M.V. Donskoy and Dr. V. Arlazarov.

Opponents for these competitions are selected randomly and, for the second time in a row, Chess 4.6 and Kaissa were not matched against each other. However, the two competed in exhibition play Wednesday night, where Chess 4.6 defeated the Russian contender.

Slate

Atkin

Chess 4.6 was programmed in Assembly language and contains a program of 7.5K words plus extended storage. The program contains an opening book of 5,600 positions, and the average number of positions examined per move is said to be 400,000.

The Russian program ran on an IBM 370/168 at Canada Systems Group in Toronto. Most of the other programs ran on CPUs in Canada or the U.S., with the exception of the West German entry, Elsa, which ran on a Telefunken TR440 in Munich using a data communications link supplied by Canada's I.P. Sharp Associates.

The English program, Master, ran on a 168 at Harwell in Britain, also using a data link supplied by I.P. Sharp.

One of the smallest processors in the tournament was a Digital Equipment Corp. PDP-11 used by the Belle program written at Bell Telephone Labs in New Jersey. Amdahl Corp. 470V/6 mainframes were used by teams from the University of Alberta, University of Toronto and University of Michigan.

The only individual entry in the tournament was the BS'66'76 program written by Barend Swets of The Netherlands. Swets played on a 370/168 using machine time donated by Datacrown Ltd.

The Dutch entrant wrote his program in 1966 when he was a computer science student at Delft University, but he has not been able to afford CPU time to work on BS'66'76 between championships, he said.

Although computer chess programs have come a long way in the last few years, Swets said it is doubtful the machines will ever play better than human experts.

Chess programs are commonly rated in Elo points, Swets said and the programs like Chess 4.6 and Kaissa are currently rated at about 1,800 points.

In a few years Swets believes the programs will have a rating of about 2,000 Elo points, but this is still below the level of a Grand Master, who would be rated at about 2,500 Elo points.

The chess programs play an erratic game, Swets said, but they take on the style of play favored by their authors as well as reflecting the playing habits of their countries.

Will Ease CPU Limitations

Much Memory for Little Money Predicted Soon

By Ronald A. Frank
CW Staff

TORONTO — The time is not far off when a million words of very fast semiconductor memory will cost only a few thousand dollars, according to Prof. M.V. Wilkes, head of the computer laboratory at the University of Cambridge in England.

Speaking at an opening day session of Congress 77 sponsored by the International Federation of Information Processing (Ifip) here last week, Wilkes said today's CPUs are not short of processing power, but short of memory cycles.

This is shown by the fact that so-called multiprocessor configurations are nearly always dual-processor systems because two processors are sufficient to utilize the available memory cycles.

Additional processors may enable a higher level of fault tolerance, but they will not materially improve the throughput. In a mainframe using a large number of microprocessors, therefore, much more money would be spent on the memory than on the microprocessors themselves, Wilkes told an audience of international attendees.

Microprocessors today are ideally suited for applications where the memory requirements are not great. These include the control of industrial processes and the control of computer peripherals.

But mainframe applications of microprocessors will have to wait until the cost of higher speed semiconductor memory has fallen dramatically, he said.

There are currently four levels of memory used in computer systems, according to Wilkes, who described them as archival memory utilizing magnetic tape; file storage using moving-head disks; intermediate storage using drums or fixed-head disk; and high-speed memory using core or semiconductor technology.

The first, second and last of these levels have clear operational requirements while the intermediate storage "exists only for economic reasons." The limit of what can be handled efficiently in paging memories has been reached and even exceeded slightly with drums and fixed-head disks used for intermediate storage, he said.

CW At Ifip

CW Photo by R. Frank

M.V. Wilkes

For this reason, the development of a memory device with somewhat similar characteristics but much greater speed "would be instantly adopted by those who are dissatisfied with the performance of their paging systems." Wilkes called this area "an immediate role for bubble memories or charge-coupled devices."

We are not very far from the point at which intermediate storage will disappear altogether, he said, adding this will happen as soon as the cost of high-speed semiconductor memory becomes low enough.

When this happens, paging as it is known today "will sink without a trace," Wilkes predicted.

But a single-level, high-speed memory containing one million words or more will present new problems. Programmers will want to have some sort of segmentation and this could well take the form of mapping the memory onto itself with the methods now employed to map a drum onto a smaller high-speed memory, Wilkes said.

This type of memory would constitute paging without having to wait for the associated time penalty when material is being transferred, he added.

The user is thus within sight of the compact computer having a processing power approaching that of modern mainframes with high-speed memory. The low cost of these machines will make them useful as stand-alone CPUs or building blocks for larger systems.

Few people would say that the stand-alone machine can meet all DP requirements because a central facility is needed for the permanent and semipermanent storage of information in bulk, Wilkes said.

But sheer possessiveness could lead a user to demand a computer in his own office. Further, when a central site is down, the user can continue to do whatever work is possible.

An argument for having a central site CPU is that there is better control and maintenance. In addition, some users require a CPU only on an infrequent basis and cannot justify a computer of their own.

For these reasons, service bureaus will continue to flourish regardless of what happens to the rest of the industry, Wilkes said.

Considering the various trade-offs between a user having an in-house CPU or using a DP center, a hybrid system may evolve in which users would be given the choice, Wilkes said.

ON ANY TRACK WE'RE HARD TO BEAT

When you talk about leasing an IBM/370, you are on a fast track. Each leasing company claims it has the best program for you. But does it? With over $200 Million of IBM/370 equipment on lease in the U.S. and overseas, Alanthus' customers are saving more than $17 Million annually. That's a real winner!

Our leases are unmatched in flexibility. We can offer you a short operating lease, a long term financial lease, or even a revolving lease. Working with you, we can custom-tailor the lease program to suit your needs. You win again!

But here's one to get you first past the post. Alanthus is offering to installed 370/158 and 370/168 users, operating leases of 1, 2, 3, and 4 year terms.

Our lease documentation is easily read and understood. It consists of only four pages plus an equipment schedule. Another winner!

Call the people from Alanthus.
We have the lease program that's best for you.
We're winners on any track.

NOW, LEAR SIEGLER AND BURROUGHS ARE ON SPEAKING TERMS.

You're probably very happy with your Burroughs mainframe.

But you'd undoubtedly like to have the versatility and dependability of Lear Siegler terminals. If only they were compatible with your present system.

Now they are. Complete with standard Burroughs polling and address line disciplines.

What's more, the ADM-2B's forms mode capability is compatible with the TD-820.

The ADM-2B gives you full text editing capabilities. Including erase to end of line/field/page. Insert and delete character and line. Blinking and blanking fields. And tabbing.

Just flick a switch and you can convert the ADM-2B to a standard ADM-2 with Burroughs line discipline.

Line diagnostic mode is switch selectable — which makes it extremely valuable for troubleshooting.

Of course, there's all the support that Lear Siegler is famous for. Throughout the United States and in many foreign countries.

$2485.

That's the full price. Including serial printer port. Numeric keypad. 24x80 character screen. 16 function keys. 110-9600 baud. RS232 interface. Burroughs two-wire direct connect is available as an option.

The fact is, Lear Siegler's new ADM-2B terminal gives you the best of both terminals. So you can use it right alongside your present Burroughs terminals and mainframe.

So rest easy, Burroughs users. Because now Lear Siegler speaks your language.

OEM
America Meets
at the Invitational Computer Conferences

In Boston...in Houston ..in Orange County, and in six other cities, OEM decision-makers meet the country's top computer and peripheral manufacturers at the Invitational Computer Conferences — the only seminar/displays designed specifically for the unique requirements of the quantity user.

In one day, at each 1977/78 ICC, guests will receive a concentrated, up-close view of the newest equipment and technology shaping our industry.

Some of the companies which participated in the 1976/77 Series were:

Amcomp, Ball Computer, Braemar Computer, Calcomp, Centronics, Cipher Data, Computer Automation, Computer Operations, Control Data, DEC, DIVA, Data 100, Data Systems Design, Dataflux, Dataram, Diablo Systems, Digi Data, EECO, Florida Data, General Automation, General Instruments, Hazeltine, Hewlett Packard, Honeywell, Houston Instrument, ISS/Sperry Univac, Interdata, Kennedy, Lear Siegler, MDB Systems, Microdata, Mohawk Data Sciences, Monolithic Systems, Omron, PerSci, Pertec, Pioneer Magnetics, Plessey Microsystems, Printronix, Remex, Shugart Associates, Tally, Tandberg Data, Tektronix, Threshold Technology, Tri-Data, Varian Graphics, Wangco, Xylogics.

The Schedule for the 1977/78 Series is:

September 7, 1977 Newton, Mass
October 4, 1977 Minneapolis, Minn
October 27, 1977 Palo Alto, CA
November 17, 1977 Houston, Texas
January 19, 1978 Orange County, CA
February 2, 1978 Ft Lauderdale, Fla
March 2, 1978 St Louis, Mo.
April 4, 1978 Hasbrouck Heights, N J
April 6, 1978 Valley Forge, PA

Invitational Computer Conferences

Invitations are available from participating companies or the ICC sponsor For further information contact B J Johnson & Associates, 2503 Eastbluff Drive, #203, Newport Beach, Calif 92660 (714) 644-6037

Transnational Processing Cited as Canadian Bane

By Nancy French
CW Staff

CW Photo by M. Upton

J. Hugh Faulkner

CW At Ifip

TORONTO — The advances in teleprocessing that have enabled foreign-owned companies here to save money by processing their Canadian data outside the country have contributed to Canada's employment and balance of payments problems, according to Canada's Minister of State for Science and Technology.

Speaking at ceremonies that opened the International Federation for Information Processing (Ifip) Congress 77 here last week, J. Hugh Faulkner said the rapid advances in computer and telecommunications technology "have combined to accentuate the problems of national control of national destinies."

The importation of information processing services resulted in lost revenues of $150 million to $300 million in 1976, according to preliminary estimates developed by the Department of Communications. The rather imprecise estimates are a result of difficulties in definition as well as valuation, an aide to Faulkner explained.

Further, this practice has cost Canadians 30,000 to 40,000 jobs through either loss or lack of creation. Although these figures appeared in a draft version of Faulkner's speech, the minister deleted them for presentation.

Faulkner compared the problem to the "brain drain" of the late '40s and '50s, during which Canadian professionals educated in the government-funded university system emigrated to the U.S. and other countries where they could earn higher salaries.

Growing Dependence

The problem of transnational data flow has "created the potential of growing dependence, rather than interdependence," and with it "the danger of loss of legitimate access to vital information and the danger that industrial and social development will largely be governed by the decisions of interest groups residing in another country," Faulkner said.

Acknowledging the concern of industry over attempts to curtail the free flow of information across national borders, he also noted how costly it would be to duplicate the large data banks required by science and industry and said there would be little to gain from such duplication.

However, he emphasized, that "national borders do exist — they are a fact of life and cannot be ignored by multinational corporations. The operation of such firms in other countries cannot be regarded as mere extensions and adjuncts to headquarters, similar to branch plants in their own country of origin."

As for the importance of international trade, Faulkner said he recognized that world progress is dependent on such commerce. However, there have been only a few short years in which it has been technically and economically feasible to import or export information-processing services.

"Here we are dealing with something intangible. You can't pick it up, you can't count it as it crosses an international boundary and most of it relates to intracorporate requirements rather than to something for sale in the marketplace," he said.

"There is a growing need for international agreement on a generally acceptable set of ground rules for dealing with these perplexing problems," he said. "We are all 'developing' nations in the new information society, and solutions to these new problems cannot always be found in tradition or precedent."

Passivity Diminished

To date society has been passive in its attitude toward advancing technologies, Faulkner said, which has led to a series of events which caused continuing and usually irreversible change.

"Unforeseen problems sometimes reduced government policies to a series of reflex reactions to unforeseen crises," he explained. He warned, however, that society is "no longer passive to advances in information processing because of the growing impact on the individual and because we have on our hands a revolution rather than an evolution."

As information is increasingly processed and stored remote from its place of origin, new approaches — nationally and internationally — will be needed if responsible jurisdictions are to protect the privacy of their citizens and ensure the right of their citizens to access all the information that should be available to them, he said.

Finally, Faulkner urged attendees to work to improve the relationship between computers and the man on the street.

Today the citizen gets little assistance when it comes to dealing with computers that send "dunning notices for payments of disputed charges and predated bills which arrive after the overdue date," for example. He blamed these problems on a "lack of acceptable standards to guide interactions between people and machines."

Faulkner praised the Canadian Information Processing Society for establishing an ombudsman service which provides a flexible and appropriate response to such complaints.

Perkin-Elmer: System Integration by Design

Our design engineers spend a lot of time talking to each other. In fact, we insist on it.

Thanks to all the talk at the drawing boards, we can offer you systems that perform. At peak efficiency.

We realize that the more fully you can utilize the power of your system, the happier you'll be.

That's why we design every single product to suit the system. And every system to optimize its parts.

Perkin-Elmer Data Systems designs and builds a complete line of minicomputers from our Interdata division; mass storage devices from our Wangco division; and I/O terminals from our Terminals division. They're all designed for system integration.

Excellent price/performance. Complete software. Field-proven hardware. Integrated sales and service. Worldwide customer support. Perkin-Elmer Data Systems supplies the tools and support you need.

Give us a call at our toll-free number: (800) 631-2154. We have a lot to talk about.

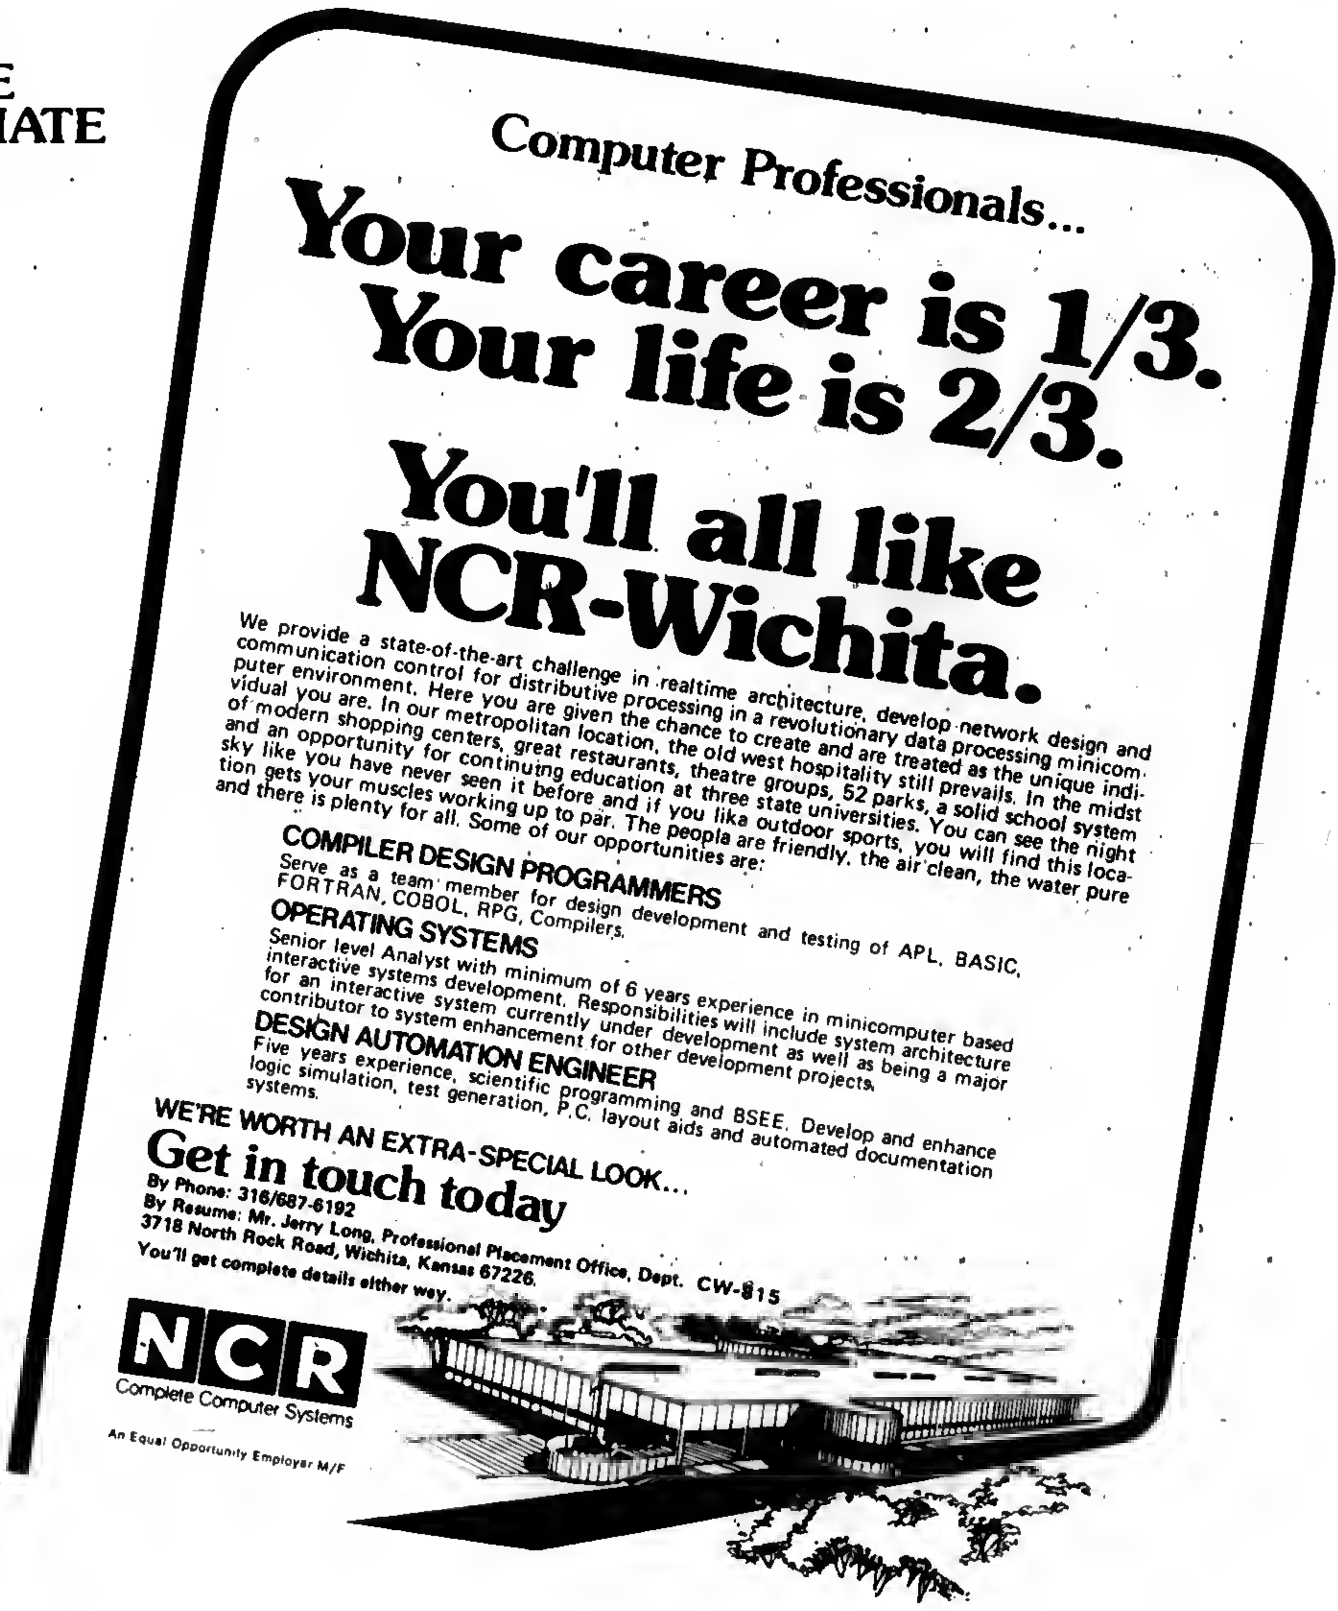
NCR-Wichita thanks you for the excellent response to our recent advertising campaign

As a result of our continuous growth pattern, a number of high level positions are still available. If you are degreed and have a minimum of 4 years experience, look ahead to the opportunities NCR-Wichita can offer.

WE WELCOME
YOUR IMMEDIATE
RESPONSE...



Computer Professionals...

Your career is 1/3. Your life is 2/3.

You'll all like NCR-Wichita.

We provide a state-of-the-art challenge in realtime architecture, develop network design and communication control for distributive processing in a revolutionary data processing minicomputer environment. Here you are given the chance to create and are treated as the unique individual you are. In our metropolitan location, the old west hospitality still prevails. In the midst of modern shopping centers, great restaurants, theatre groups, 52 parks, a solid school system and an opportunity for continuing education at three state universities. You can see the night sky like you have never seen it before and if you lika outdoor sports, you will find this location gets your muscles working up to par. The peopla are friendly, the air clean, the water pure and there is plenty for all. Some of our opportunities are:

COMPILER DESIGN PROGRAMMERS
Serve as a team member for design development and testing of APL, BASIC, FORTRAN, COBOL, RPG, Compilers.

OPERATING SYSTEMS
Senior level Analyst with minimum of 6 years experience in minicomputer based interactive systems development. Responsibilities will include system architecture for an interactive system currently under development as well as being a major contributor to system enhancement for other development projects.

DESIGN AUTOMATION ENGINEER
Five years experience, scientific programming and BSEE. Develop and enhance logic simulation, test generation, P.C. layout aids and automated documentation systems.

WE'RE WORTH AN EXTRA-SPECIAL LOOK...

In Position Paper

DPMA Rejects Software Taxation

PARK RIDGE, Ill.— The Data Processing Management Association (DPMA) has issued a position paper calling software an intangible personal service that should be accorded the same treatment under the law as services by other professions.

The position paper was issued in preparation for the society's coming campaign against software taxation.

The paper cited the definition issued by the Tennessee Supreme Court Commerce Union Bank vs. George Tidwell.

Software is "information and directions loaded into the machine which dictates different functions for the machine to perform. What triggers these functions are referred to broadly as 'programs' and are often accompanied by magnetic tapes and disks, punch cards, manuals, flow charts and expert engineering assistance to comprise what is known in the industry as computer software," the court stated.

The DPMA paper pointed out that any tangible property, if used, is an inconsequential element of intangible software because:

- "Said software may be entered into a computer directly or via telephone lines with no tangible personal property, with the identical result as if tangible property were used as the input communications medium."
- "Such communications media are merely intermediate input means of entering software into a computer on a one-time basis before it is transformed into its intangible end state of binary pulses."
- Said tangible property, if any, is either destroyed or reused after being used to transfer the intangible information therein to the computer on a one-time basis, leaving instructions (program) and information (data) in the computer in the form of binary pulses as the intangible end state."
- "The value of said tangible property, if any, is small, 5% or less, in comparison to the value of said intangible software."
- "Any tangible property, if used, has virtually no value in itself. Any value is in the information, which is valuable only when read by the computer and transformed by the computer into its tangible end state of binary pulses."

IBM Division Plans Solar Heat

AUSTIN, Texas — IBM's Office Products Division is planning to install a solar-powered water-heating system at its development and manufacturing facility here.

"The solar-powered water-heating system, used in conjunction with IBM's computer-based Energy Management System, is expected to reduce our dependency on natural gas for boiler fuel by approximately 60%," according to Tom Backus, general manager.

The solar system is expected to be in operation by this fall.

Introducing a new set of characters.

TI's Model 745 is now available with APL.

Now, the *Silent 700** Model 745 Portable Data Terminal addresses itself to your applications in science, education, business and finance. And other programs requiring APL.

And since we're in character with your needs, you'll be able to understand the other benefits that have made the 745 the most popular portable data terminal on the market.

TI's 745 offers you fast remote access to your central computer. With lightweight 13-lb. briefcase mobility.

The terminal itself interfaces by way of a built-in acoustic coupler or an auxiliary EIA port. With virtually silent printing at 30-character-per-second data transmission rates. And a rugged TI microprocessor-based design.

The 745 with APL features half or full duplex operating modes. Standard parity options. And ASCII/APL keyboard. With readable font, true underscore and real back-space key.

To find out more about TI's 745 with APL, or our desk-top Model 743 KSR with APL, simply fill out the coupon and mail today. Or call your nearest TI sales office.

The 745 translates into a better solution for your APL needs.

Although Financial Systems Strong

DP Donation to Patients' Care Called Small

By Edith Holmes
CW Staff

WASHINGTON, D.C. — Although computer technology has greatly improved patient billing, it has yet to contribute significantly to patient care, according to W. James Prowse, a partner with Touche, Ross & Co.

Addressing an OCR Users Association conference here recently, Prowse said there have been several highly technical computer applications to serve patient needs, but "most of the computing in the U.S. health care system today is concerned with hospital payroll and with the myriad artificial complexities of billing, accounts receivable and insurance claims processing."

The "silver bullet" that some physicians believe DP can be in the direct care of patients is a long way away, given the funding that research in this area receives — or doesn't receive, Prowse added.

Because funding for DP research in hospitals and similar health institutions tends to be spent on financial applications, Prowse believes it unlikely these organizations will pioneer any real progress in computers and patient care.

Sophisticated Payroll

Many hospitals have sophisticated financial management systems which include programs for payroll, billing, accounts receivable, inventory control and general ledger maintenance. Accounts payable is a minor application in most hospitals, he said.

Those institutions with foresight are also using their financial systems to do cost accounting in an effort to understand what their costs actually are, Prowse said, noting this is "a very difficult area."

Not much has been done in hospitals in computerized operations management, he continued. Admission, discharge and census of patients as well as outpatient and emergency room registration may be automated, but usually support the billing and accounts receivable applications.

Some institutions have spent millions of dollars to automate the scheduling of hospital admissions, outpatient visits, operating rooms and plant and equipment maintenance, Prowse noted. So far, however, this application hasn't proved cost-effective; the hospital might as well have a person arranging the schedules for these tasks, he said.

Applications in patient care are interesting in themselves as well as in what they haven't achieved, Prowse said. Next to billing and accounting applications, computers have been used to the greatest extent in acquiring data on patients for analysis in a hospital's clinical labs, he stated.

In the data acquisition area, analog outputs for devices attached to the patient are converted to digital signals that can be analyzed by computer. Minicomptuers play a large role in these "Rube Goldberg-type devices," Prowse said.

Minis have made great strides in analyzing data in areas like biochemistry, hematology and physical medicine, he added. Reports from these systems can improve a hospital's quality assurance program and get the necessary information to the physician who is treating the patient.

Other applications in the area of diagnosis of patient ills include computer-assisted diagnosis, diagnostic radiology report input and computer-assisted organ imaging. Chiefly research funded, these applications tend to be on-line through time-shared terminals, Prowse said.

Automated radiology reports have been designed to handle routine test results, for example, a negative chest X-ray. The area receiving more attention at the present time, however, is organ imaging, which requires a computer to produce images of a person's internal organs in readable form, Prowse explained.

Prowse: Hospitals Giving Birth to Mini Boom

By Edith Holmes
CW Staff

WASHINGTON, D.C. — What does the future hold for the use of computers in health care?

More minicomputers everywhere, according to W. James Prowse, a partner with Touch, Ross & Co.

So far, minis are best suited to the needs of a variety of clinical applications, and more doctors will be able to come up with the dollars needed to purchase these machines, Prowse told the OCR Users Association at a recent conference here that attracted over 300 people.

The proliferation of minis through the hospital or institutional health care setting will also make it harder on the managers of centralized DP shops to manage the computing going on in these organizations, he added.

In addition to predicting that minis will become more widespread in health care, Prowse expressed his belief that hospital information systems as a whole will become cost-effective.

Forcing this trend will be cheaper equipment as well as medical personnel who are less afraid to use these machines, thus eliminating the DP people who now provide the interface between doctors and terminals, Prowse said.

There will also be more machine-to-machine billing, employing optical character recognition (OCR) as an interim step, he suggested. With the proliferation of minis in hospitals, Prowse contended insurance companies will take tapes and disks directly from these processors to do their own DP.

If national health insurance ever comes about — and Prowse emphasized "if" — hospital computers will be released to perform more interesting tasks than the billing applications that consume all their time now. National health insurance would diminish the hospital's need to unravel the complexities of third-party billing that exist now, he added.

The health care business will see an opportunity to develop a national citizen medical record with impacts on patient care, public health and health service, he stated.

The development of such a medical record, however, would carry with it "mind-boggling problems of confidentiality and security," Prowse said.

Contribution Called Small

(Continued from Page 14)

All of these applications present something of a crisis for the hospital's DP department, which over the years has moved from a machine like an IBM 360 to an IBM 370. What does such a department do with all the organ imaging equipment that comes along? How does it handle the radiologist who suddenly wants a compiler of his own?

There are other application areas with which the DP department must now contend. Radiotherapy treatment planning — a technique designed to destroy a tumor — is a minicomputer-based, highly computational application.

The technique is difficult to perform with a time-sharing system; a hospital needs about $60,000 worth of minis and peripherals for a system that isn't in use all the time, Prowse noted.

Blood banking is the solid patient treatment application on the books right now. A proven computer application to a medical problem, blood banks can be maintained on any kind of system, including traditional batch, Prowse said.

Computerized in-patient treatment includes the automated capture of a physician's orders and their transmission to various elements of the hospital, order editing of conflicting physician directions, computer-assisted preparation of nursing care plans, the transmission of some test results to nursing stations and computer-assisted preparation of patient management guidelines, he stated.

Monitoring of patients in the intensive care unit requires a minicomputer, which can be obtained off-the-shelf these days and simply substitutes for a nurse, Prowse added.

Digital introduces DECstation.
A big computer system
that's small enough for anyone.

Digital put an amazing LSI version of the PDP-8 inside a DECscope, added some ingenious interconnecting devices and created something new. The DECstation. A complete computer system big enough to do all kinds of work and small, simple and inexpensive enough to do it for almost anyone.

DECstation. A complete computer system in disguise. It looks like a terminal, but look again. The DECstation has a powerful general purpose computer, a video terminal, a dual diskette drive, and its own special operating system. What's more, you can hook up two different printers and a second dual diskette drive. Then put the whole thing in a mini-desk, and when you're done you'll have the smallest big computer you've ever seen.

The Video Data Processor. It's the big reason the DECstation's so small. The VT78 Video Data Processor is a computer wrapped in a terminal. Inside the familiar DECscope you'll find an LSI version of the PDP-8 with 16K words (32K characters) of MOS memory and built-in interfaces. Two serial asynchronous ports feature speeds from 50 baud to 19.2 kilobaud. A disk port interfaces with up to 4 diskette drives. A parallel I/O port for printers and custom interfacing provides data transfer rates up to 180 kilobits/sec. All standard.

You can go from carton to computer in less than an hour. If you can push a button, you can run a DECstation. Because one button is all it takes to start things up. The bootstrap and self-test routines are built in.

Put it together, plug it in, and immediately you can begin to run anything from the PDP-8 software library. Which means you start with one of the most comprehensive sets of software tools available in a small system. Including two proven operating systems: OS/78 for stand alone applications and RTS/8 for real-time. OS/78, an extension of OS/8, supports a number of languages, including FORTRAN IV and BASIC. So all you have to do is load the operating system and start programming your application.

Whatever that application, if you're looking for a sophisticated little system, at the right price, and a remarkable OEM tool, consider DECstation. $7995 each. $5436 OEM quantity 50.

A Comforting Thought

The use of computers in a society can be as useful or as esoteric as that society chooses to make it.

That not-so-startling idea is vividly emphasized in a recent *Time* magazine article that contrasted computer usage in the U.S. and the USSR.

According to an unnamed "Western cybernetics expert in Moscow," Americans have dealings "linked with a computer at least 10 times a day" while the average Russian comes in contact with a CPU "perhaps once every six months."

The article did not identify the expert who made this value judgment, nor did it explain how the expert compiled the statistics.

Nevertheless, the comment illustrates the basic contrast between computer use in the U.S. and the Soviet Union. Computer abuse and many of the problems that have been created in this country related to personal privacy are a direct result of the pervasive manner in which this society utilizes DP power.

The computer has been used in many ways to make life simpler and easier. The alternative approach is the one adopted in Russia, where the average person is rarely affected by computer systems.

It is true that problems and potential abuses come with the U.S. approach, but somehow it is more comforting to live with these problems, trying to solve them, than it is to keep the computer out of reach of the public.

Bad Planning

There will be two microcomputing shows on the East Coast during the fourth week of August: Personal Computing '77 in Atlantic City, N.J., and Computermania in Boston.

While it is important to have shows in different parts of the country to reach the hobbyists who don't have the benefit of expense accounts, the thought of two significant shows being held during the same time frame is disturbing.

The microcomputing industry is a young one, and both the users and manufacturers are experiencing growing pains. Much of the marketing sophistication and polish that the IBMs, CDCs and NCRs have is nonexistent in the micro marketplace.

Also lacking is the hard cash to support multiple show locations. Companies that have just outgrown their infancy and are beginning to establish themselves with some degree of stability in a vibrant marketplace cannot afford to miss a single show — but they can't afford to cover concurrent shows, either.

The user is also hurt by the conflicting show dates, for just as every vendor may not be able to exhibit at every show, the idea of coughing up hard cash to visit a show with fewer than anticipated vendors is a hard one to swallow.

The shows themselves are bound to get hurt. When the users and manufacturers recognize they are not getting full value for their money, they will undoubtedly seek other means of getting in touch with each other.

These conflicts in show dates are unhealthy for everyone concerned. It doesn't matter whose fault it is and it's unimportant what the underlying reasons are; what it comes down to is that such scheduling conflicts as the Boston/Atlantic City one show a degree of immaturity that casts a shadow on the entire industry.

Let's hope that clearer thinking guides the scheduling of future shows.

Letters to the Editor

Person First, DPer Second

Jack Stone's Aug. 8 column ["DPers 'Disconnected' From Family Life?"] certainly raised some provocative questions. In my opinion, however, the main problem lies with the attitude expressed by Stone and Painter Hoffman and, apparently, by others too.

I do not consider myself a "computer person." I am a person who happens to work with computers.

Once one starts thinking of oneself as a "blank person," with the blank being "computer," "doctor," "lawyer," "Indian chief," or whatever, it is natually the "blank" that becomes the important title; the person part of it is subordinated.

Perhaps the best solution to the problem of dehuminization is for us all to think, act and refer to ourselves as people first and as DPers second, if at all.

David A. Schlesinger
New London, Conn.

Story Sensationalistic

I read with considerable dismay "CRTs Cause of Editors' Cataracts?" [CW, Aug. 1]. This article was a disgrace both regarding its implications on an important segment of the computer industry and in its overall lowering of *Computerworld*'s, editorial standards.

During the last 15 years, hundreds of thousands of CRT terminals have been shipped to users all over the world. Intensive use of these devices is commonplace in many industries, including transportation, insurance, manufacturing and publishing.

If these CRT devices are the cause of cataracts (or any other disease), I am sure there would be documentary evidence to that effect and it would have come to light years ago, during CRTs early field history.

Now we are confronted with an isolated situation to which Computer*world* devoted front-page coverage, with the implication every CRT be provided with a label indicating that "Use of This Device May Be Hazardous to Health." In point of fact, the article admitted that a firm link between the cataracts and CRTs has yet to be established.

Consequently, I am sure many of us in the CRT industry are asking what the purpose of the article was other than sensationalism or the fact that CW may have been hard up for front-page news.

Articles of the type in question make Computer*world* look like the *Notionol Enquirer*. What little gained in sensational eye-stopping headlines will be lost along with CW's credibility as a serious industry trade journal.

John T.M. Pryke

Where Did Pages 31-36 Go?

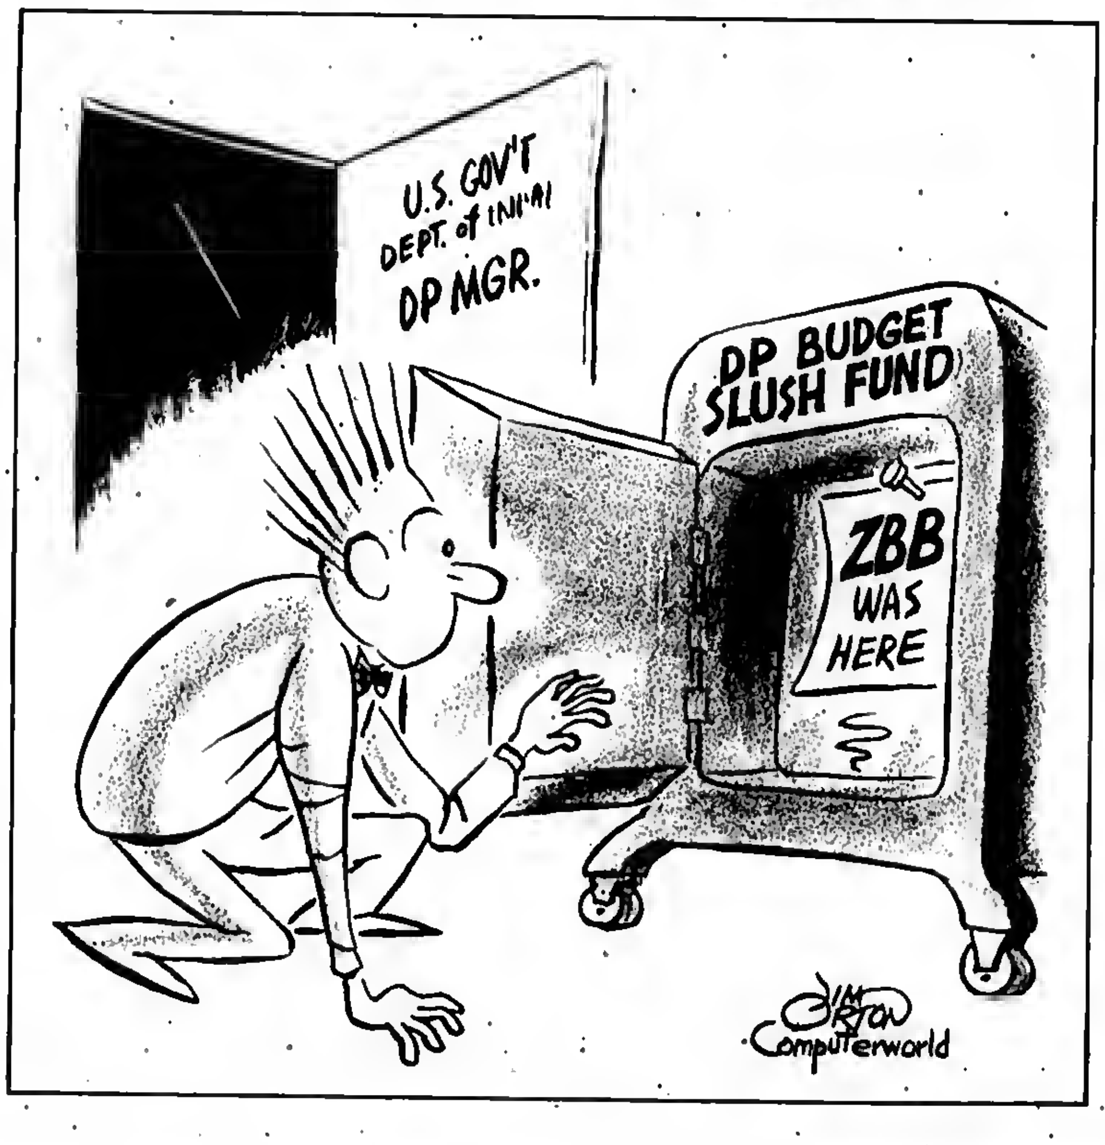
In the mail today, I received the Aug. 1 edition of Computer*world* On Page 1 was an article, bordered in black lines, boasting of the new computerized typesetting used in the issue.

As I was leafing through the paper, I noticed that the page numbers skipped from 30 to 37, at least in my copy. Were the page numbers assigned by computer, or were the pages left out of my copy, or what?

It certainly does not make a good impression for a computer industry newspaper to err like that.

Gary Rubin
Rochester, N.Y.

There was no error. Postal regulations require us to number all "pages." A three-fold advertising insert, printed on all six sides, counted as pages 31-36. Ed.



Data Past

Five Years Ago
Aug. 16, 1972

WHITE PLAINS, N.Y. — IBM 370 users with two or more 3330 disk drive spindles could save up to 73% on monthly rentals of IBM disk controllers with a series of options from IBM. IBM cautioned, however, that the options could result in degraded performance under some circumstances, since a user had first to get one or more Model 3333 units. The 3333s cost $327/mo more than a standard two-spindle 3330.

———

SANTA MONICA, Calif. — Allied Computer Technology, Inc. introduced the Selectoplex Channel, a block multiplexer channel plug-compatible with the IBM 2860 selector channel. The company claimed the device could extend tho life of large IBM 360s by three years.

Eight Years Ago
Aug. 20, 1969

IBM stated basically 'What's yours is ours' in its contract with users for services of systems engineers. The contract stated ". . . [I]t is agreed that no idea, concept, know-how or technique relating to data-processing shall be deemed confidential. To the contrary, IBM shall be free to use and disclose any such information during the course of this agreement and thereafter in any way which it may deem appropriate.

———

EAST NATICK, Mass. — Sylvania Electric Products, Inc. introduced a laser "tape drive" which made permanent recordings on 8mm film. Tho device had a peak packing density of 180,000 bit/in. and a recording rate of up to 21.6 million char./sec.

Keeping Up With DP: What's a User to Do?

The Human Connection

By Jack Stone
Special to CW

Juggernaut! The crunching, irresistible onslaught of the mighty forces of new computing technology moves ever onward, trampling over the programming innocents, the systems tyros and the user novitiates.

Yes, I bewail and bemoan, I suffer and sorrow, I ache and agonize. Why? Because I, too, dear reader, have been impacted.

You might well remark, "So what's new? We've all been hit with new announcements."

But I rejoin, "Yes, it's so easy to gloss over new generation announcements within the sanctum sanctorum of the computer center. It's much more difficult to accept a trouncing in the sharp(-shooting) spotlight of the public medium."

Here is my story:

Eons ago, I wrote of my discovery of THE ANSWER to THE MACHINE for programming concepts training [CW, June 6] which, incidentally, I adopted as my family's (nonalphabetic) computer system.

It was (and I write this most remorsefully) the Texas Instruments, Inc. SR-56 Key-Programmable Electronic Slide-Rule Calculator with Algebraic Operating System, for which I shelled out the nontrivial sum of $79.95.

(If the truth be known, I purchased the machine as an item for my business, like any red-blooded American computer services entrepreneur, to obtain the tax write-off and with the intention of renting time on the machine to my kids for 10 cent/hour plus the cost of supplies and a one-time charge for documentation.

(Figuring three hour/day usage by these computer neophytes and a five-day week, I could see my investment returning to me within the year, assuming that during the hilling period my perspicacious offspring would not take a pickax to the chip to see what made it chirp.

("Like father, like son," they say. My offspring came back to me with a counter-proposition. They assembled a horde of their teenage roustabouts and obtained long-term commitments for the purchase of machine time based on volume purchasing.

(And they offered the time at 20 cent/hour list and 15 cent/hour in volume. We were in the process of negotiating a third-party lease when I went off to NCC '77 in mid-June and IT was announced.)

I first learned about IT while waiting for a conference bus in Dallas. I spotted an old friend who works for the CIA and we began chatting about personal computing. I proudly announced my recent acquisition of the "56" and he retorted, "My friend, what are you doing with that old junkpile? Do you also drive an Edsel?

"The '56' is an archaelogical relic to be enshrined in a time capsule, designed to tell folks in future years how it really was in the dawning days of computerism in American society."

I was shattered. My technical obsolescence was showing and I didn't even know it. I struggled valiantly to fight back.

"Hey, man, I just bought it last month. It's the latest and greatest, guaranteed!"

"No, man," he rejoined, "as technical giants go, you are the amazing shrinking man. THE calculator is the new TI Programmable 58, which has the solid-state 'bubble' program library facility."

"Now, wait a moment, here," I responded. "My salesman has been preprogrammed to contact me day or night in the event of a new announcement, and I have heard nothing."

"Of course you wouldn't, since announcement is not scheduled until this morning. You see, we've had 75 of our field agents, 23 of our overseas operatives and 122 clandestines following this technology development very closely. There is just no way we are not going to be number one . . . NUMERO UNO . . . DO YOU HEAR? . . . NUMERO UNO!"

Brrrooother! Was he emotional on the subject of technology supremacy. I covered my embarrassment with a nervous laugh and tried gamesmanship.

"Golly neb, those TIniks are really clever — first the 'chewing gum' magnetic card storage on the SR-52, and now the 'bubble gum' solid-state storage for the '58.'

His face flushed. I thought he was apoplectic. He raged, "No, you idiot! It's a magnetic bubble configuration which — oh, what's the use? You latter-day scientists are all washed up — you'll never catch up."

He fumed as he stepped on the bus. I didn't see him at all during the convention.

I slithered past the TI booth on the exposition floor and deftly placed one copy of the new announcement in my shopping bag. I immediately caught a taxi to my hotel room, locked the door, closed the curtains, turned up the TV volume and plopped into my bed to study the specs.

I almost lost my mind! Solid-state master library of 25 basic programs "free" with the machine, with about 5,000 keystrokes of program information, accessible directly as read-only memory or downloadable into primary memory ... 480 positions of main memory, partitionable by the user into program storage accessible by character and data registers accessible by word ... nine levels of pending calculations in the algebraic hierarchy ... 108 keyboard functions performed by 45 keys ... scientific, engineering and fixed-decimal notation modes ... user-defined labels ... short-form addressing ... insert/delete instructions with automatic resequencing ...six levels of subroutines ...10 control flags ... indirect addressing ...and on and on.

Bought Bundle

I bought a bundle of the '58s" for a class I'm teaching. They're a fabulous help for training in programming concepts, and a great bargain for $119.95 plus tax each, including massive documentation. Unfortunately, they all have to be delivered to my customers.

As for my electronic fossil — the SR-56 — I'll stick with it to protect my investment. I'll just hunker down and tough it out until TI comes out with an alphanumeric capability and a very large wad of bubble (gum?) memory.

I have the stock answer to challenges from my testy colleagues which I have already checked out with my kids when they found out about the "58": "Boys, I have a "56" installed and am currently studying the new announcement before placing a "58" on order."

Readers Eye Criteria in Sale of DP Lists

The Taylor Report

By
Alan
Taylor
CDP

The recent questionnaire in this column requesting comments on the disclosure of Social Security numbers (SSN) when government lists are sold [CW, July 11] produced the clarification for which I was looking.

It is not the SSN issue that worries people.

Nor is it the fact that a person providing his SSN for such purposes as obtaining a driver's license is not told at that time that the number may be used on lists that will be sold.

Instead, readers said they were worried about *how* those lists are used.

And the relationship between the government entity, such as the Massachusetts Registrar of Motor Vehicles, and the person ordered by law to register motor vehicles with him is such that it could be argued that person faces an implied coercion of approval — even when the person does not know what the actual use will be.

The amount of benefit or harm involved is a third key element. It is insufficient to know that some firm paid the Registrar $50,000 for the current year's vehicle registration master file.

It is even less acceptable to know nothing beyond the amount of the sale. The use of the $50,000 also has to be known — and shown pretty specifically — before anyone can give proper permission to retain his name on lists that are sold.

Equally, full information about any possible embarrassment or harm has to be provided, both on an individual and general basis, before any such approval can be provided. It may sound very nice — but if some car salesman is going to use the list to help the other side in a motor vehicle accident case, then self-interest could easily win out over the general good.

Finally, a person who approves the inclusion of his name on lists that are up for sale should be allowed to withdraw his name at any time.

DPers could use these points as guidelines to help management consider whether a particular sale should take place. These could be phrased in questionnaire form, with a space for answering "yes" or "no."

The questions would be:

- Has individual approval been given?
- Before approval was granted, were the uses to which the funds gained from the sale of the list will be put detailed?
- Was any individual or general harm or embarrassment that might occur explained?
- Have the possible future uses of the information been explained?
- Can approval be withdrawn by the individual whose data is involved?

From these simple questions, the person or board approving any such sale could quickly come to a decision. For instance, a charity specializing in skin diseases might well be prepared to "trade" a mailing list with the research department of a drug company wanting to find some rare combinations of circumstances, even though no apparent financial benefit to the charity, or even knowledge of the sale to those on the list, was apparent.

At the same time, the charity could well refuse to sell the list to some museum shops wanting to sell Christmas gifts at a high profit, even though the shops were prepared to pay and the people on the list had given general approval of "uses that benefit."

In short, by describing the situation of the person involved to those making the sale decision, matters will not happen automatically. And that is the most important thing.

Your comments are asked for on this approach — and, perhaps most important, on how it could be introduced into general DP practices.

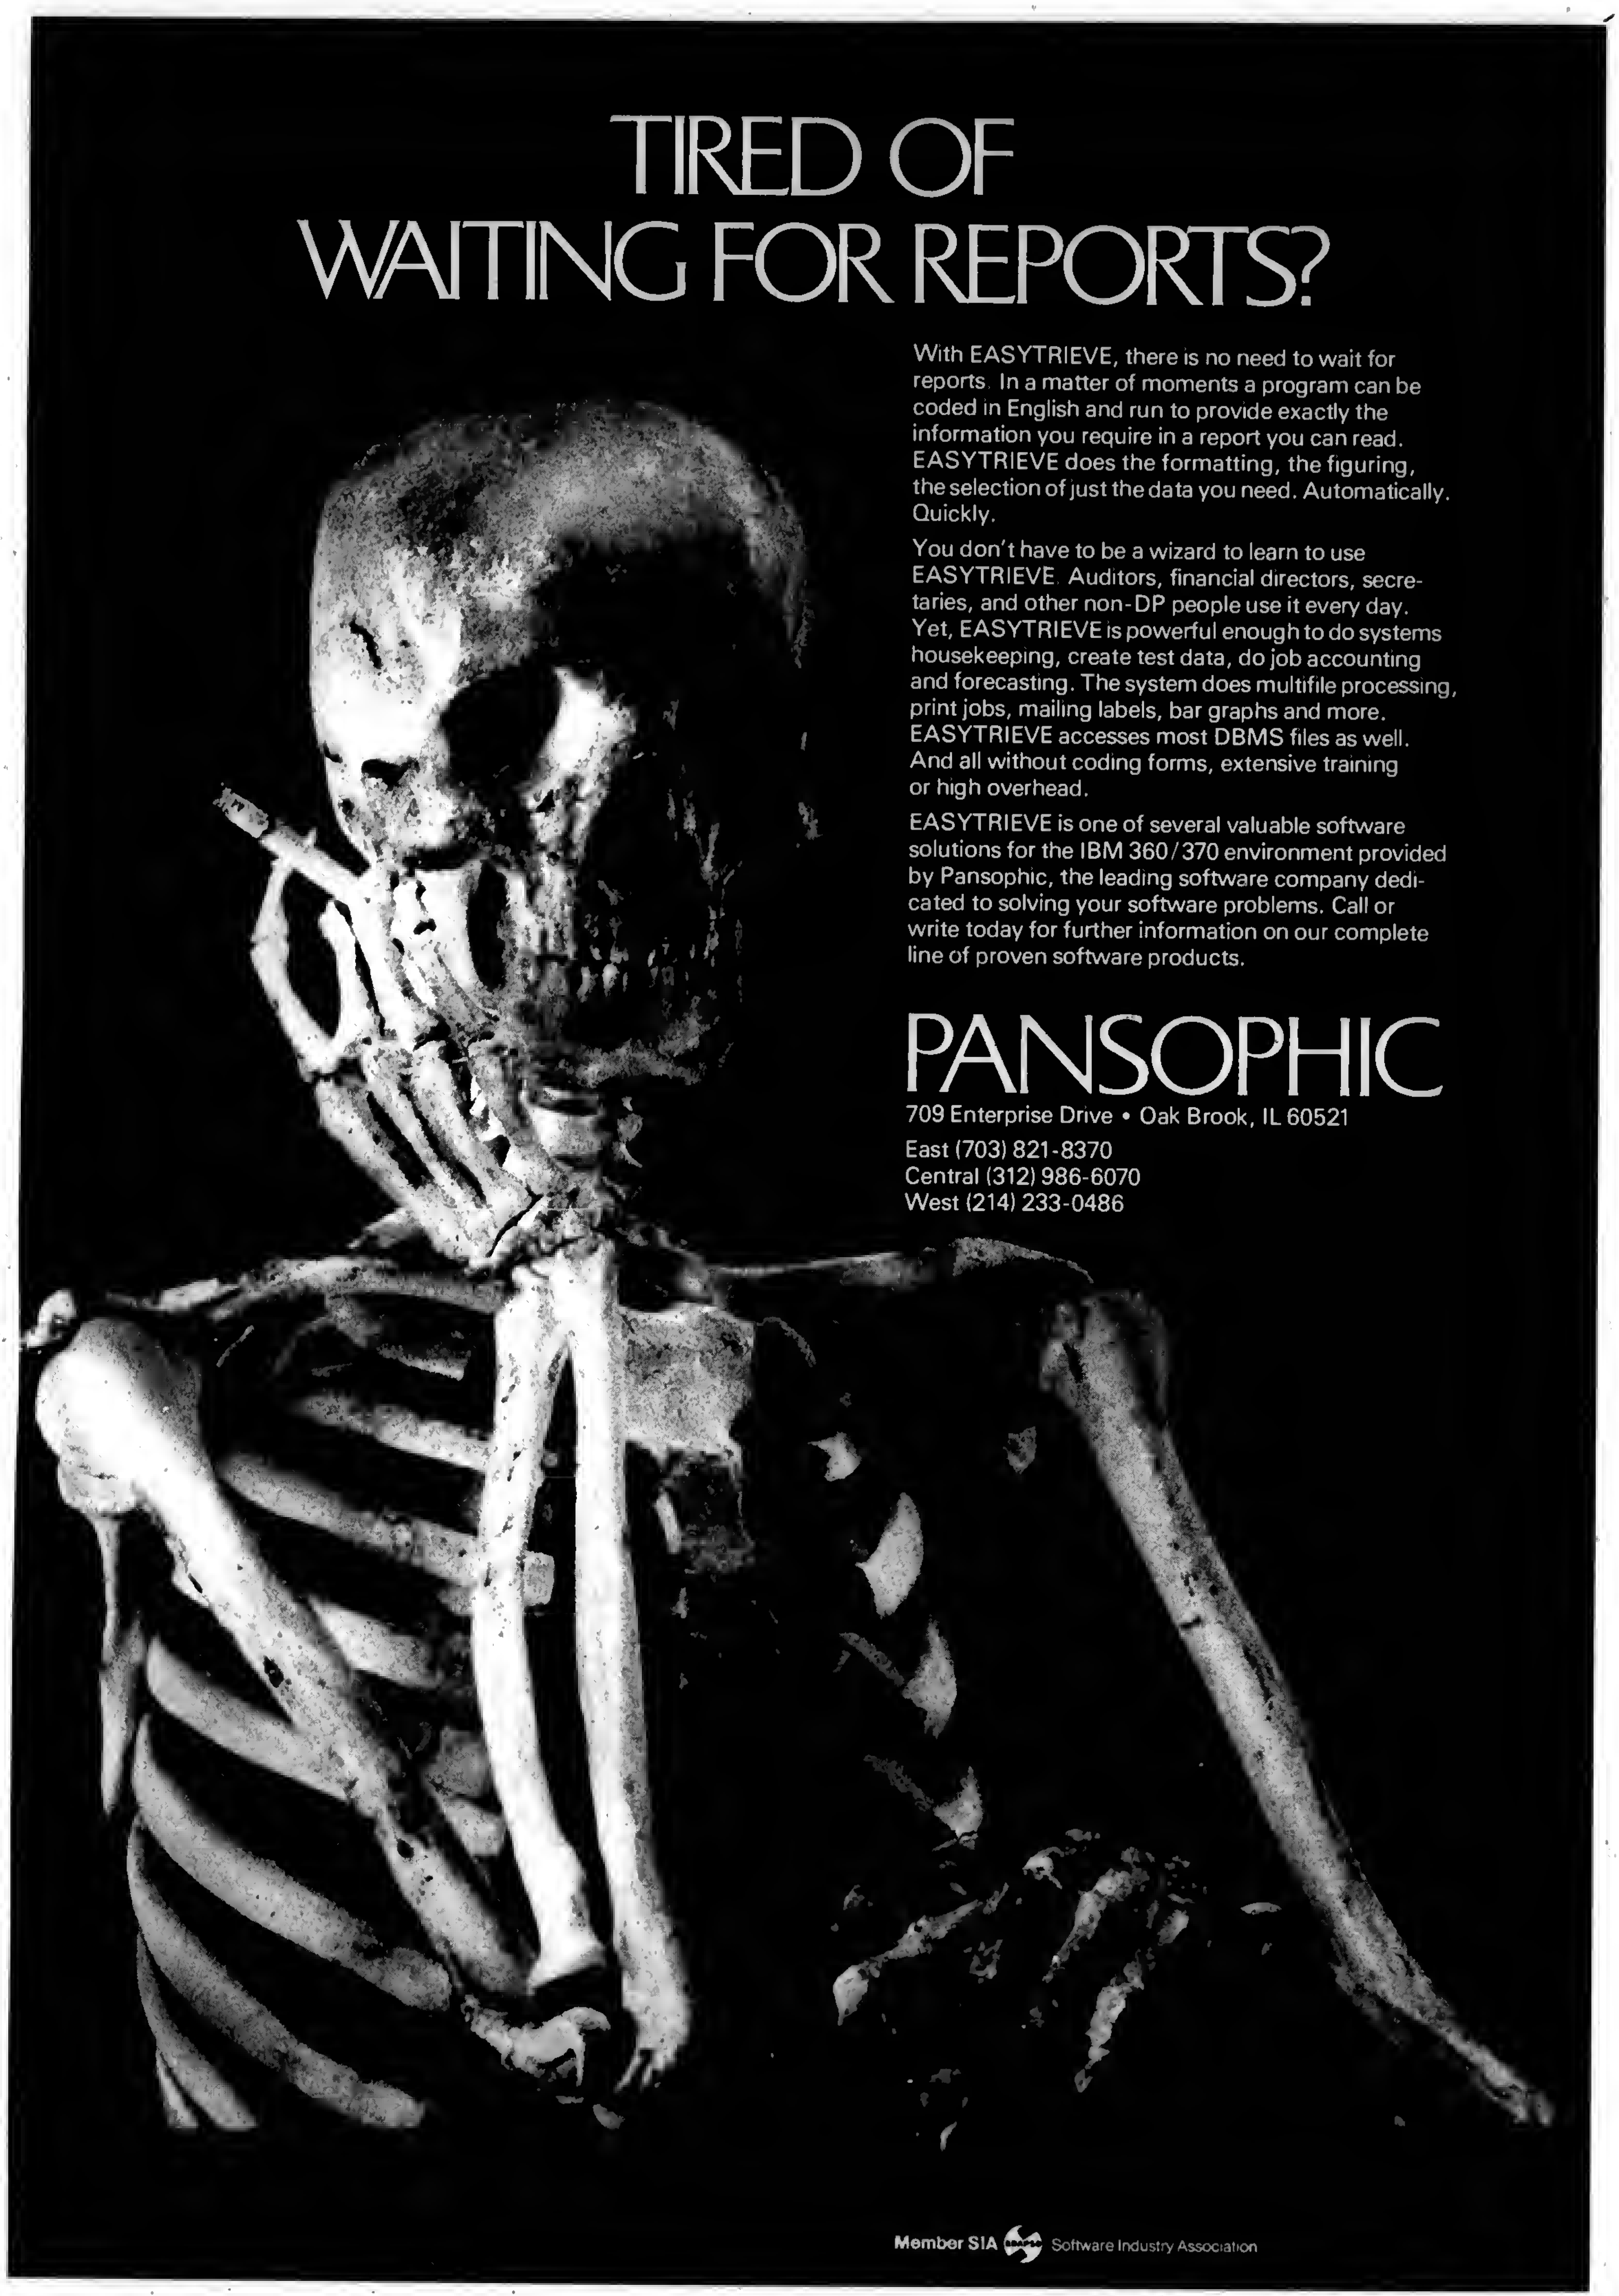
Correction

In the earlier column on sales of mailing lists, it was erroneously reported the Massachusetts Department of Motor Vehicles had offered its master file of drivers licenses for sale. What was offered, and has since been sold, was the department's motor vehicle file.



TIRED OF WAITING FOR REPORTS?

With EASYTRIEVE, there is no need to wait for reports. In a matter of moments a program can be coded in English and run to provide exactly the information you require in a report you can read. EASYTRIEVE does the formatting, the figuring, the selection of just the data you need. Automatically. Quickly.

You don't have to be a wizard to learn to use EASYTRIEVE. Auditors, financial directors, secretaries, and other non-DP people use it every day. Yet, EASYTRIEVE is powerful enough to do systems housekeeping, create test data, do job accounting and forecasting. The system does multifile processing, print jobs, mailing labels, bar graphs and more. EASYTRIEVE accesses most DBMS files as well. And all without coding forms, extensive training or high overhead.

EASYTRIEVE is one of several valuable software solutions for the IBM 360/370 environment provided by Pansophic, the leading software company dedicated to solving your software problems. Call or write today for further information on our complete line of proven software products.

Random Notes

'Marketab' Gets Fortran Rewrite

NORWALK, Conn. — Designed to simplify the processing of questionnaire and survey data as well as the tabulation of existing data files, Marketab from Mnemonics, Inc. has been rewritten in Fortran to be compatible with most computers used today, a spokesman said recently.

The system is currently running on a 65K-byte/32K-word Data General Corp. Nova 3/12.

Object code for Marketab is available for $20,000; the Fortran source code costs $22,500. Lease and lease/-purchase plans are also available, the company noted from 280 Connecticut Ave., Norwalk, Conn. 06854.

PCS Enhances Net

VAN NUYS, Calif. — Having installed System 2000 earlier this year [CW, June 27], Proprietary Computer Systems, Inc. (PCS) has now interfaced the data base management system with its own word-processing system on its remote computing network.

The linkage allows users to manipulate large data bases and then produce reports in formats not normally available with conventional DP approaches, a spokesman said from 11125 Saticoy St., Van Nuys, Calif. 91406.

UCC Gets IMSL Library

DALLAS — The 367 Fortran subroutines of the International Mathematical and Statistical Libraries, Inc. (IMSL) library have been added to the facilities available to users of University Computing Co.'s (UCC) remote computing services.

UCC clients will be provided documentation, newsletters and telephone support from IMSL, UCC said from 1930 Hiline Drive, Dallas, Texas 75205.

'To Each His Own'

Etos Creates Virtual PDP-8

HARTFORD, Conn. — Multiple users of a Digital Equipment Corp. PDP-8 can each have a virtual machine with 32K words of memory running under OS/8 or COS-300 with an enhanced version of the Educomp Time-Shared Operating System (Etos) now available from Educomp Corp.

The update provides the small DEC installation with support similar in concept to what is available to IBM 370 shops under the mainframer's Virtual Machine facility; VM/370. Etos supports batch, real-time and time-shared operations running simultaneously, a spokesman noted.

Although any PDP-8 operating system can be used under Etos, Educomp is stressing its support of OS/8 and COS-300 since they are the most widely used systems in the PDP-8 world. With Etos in place, "the myriad of languages available on a PDP-8" can be run concurrently.

Requiring a minimum 24K-word Omnibus PDP-8, the system is said to create a resource-sharing environment with immediate access to card readers, line printers, multiple disk drives, flexible disks, magnetic tapes and terminals "of almost any description."

Virtual disk file storage areas are normally allocated dynamically, but can be preallocated to minimize access time within data files and to ensure space will be available even before a long run is executed, he said.

A single board time-share control module (TSC8-75) is required in addition to the Etos software in order to support the virtual machine environment. TSC8-75 is priced at $2,500 and the Etos software costs an additional $3,450.

Users must have valid licenses with DEC for the user of OS.8 or COS-300 before Educomp will link either of those operating systems to Etos, the spokesman added.

Educomp Corp. is a subsidiary of Quodata Corp., 196 Trumbull St., Hartford, Conn. 06103.

Cobol Changes Eased With 'Chain Charts'

CHERRY HILL, N.J. — The Logic Chain software from Applications Programming Co. (APC) is said to be a maintenance/enhancement system that significantly reduces the time required by a programmer to make changes in existing Cobol programs.

Designed for use in IBM 360/370 or Burroughs B3500/-B6700 environments, the system provides analyses of both instructional flow and data flow within whatever Cobol source program has been input for study, an APC spokesman claimed.

The logic chain chart produced by the system takes the place of the conventional source program Procedure Division and the procedure cross-reference listings during maintenance and updating. This saves "over 70%" of the time presently spent trying to follow instructional flow, the spokesman added.

Although the logic chain chart looks rather like a conventional program flowchart, APC said it is a different and a better document.

The system runs on an IBM DOS-based configuration with 36K bytes available for the program, one disk pack for work files, a card reader and a line printer. IBM OS users require 62K bytes for the program and Burroughs installations should have 36K for a B3500 or 7K words for a B6700.

The package is being distributed on a lease basis for $7,800 the first year, with recurring charges of $900/year, including maintenance. APC is at 498 N. Kings Highway, Cherry Hill, N.J. 08034.

NCR 8200 Gets Precompiler

TULSA, Okla. — Fastbol from Sage Computers, Inc. is an interactive source entry system and precompiler for Cobol programs being developed or modified for the NCR 8200, according to a Sage spokesman.

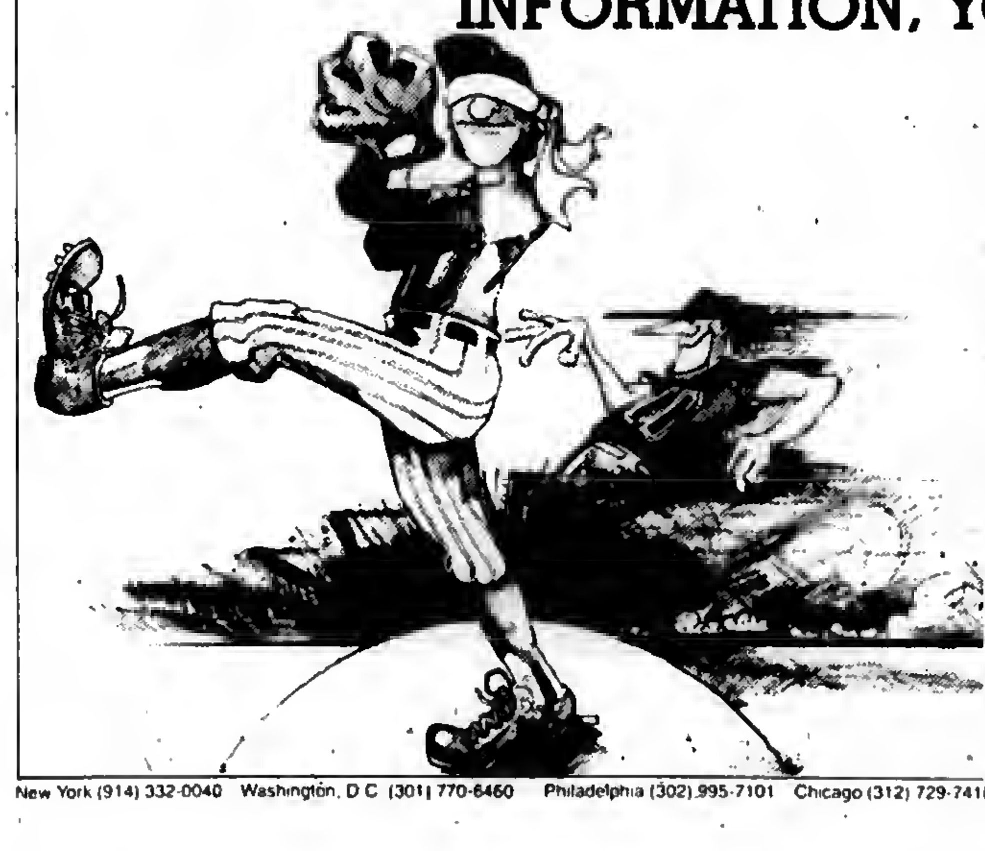
The software supports faster development work, he said, by allowing the use of certain abbreviations in original coding. As with precompilers for larger systems, Fastbol expands this shorthand into standard Cobol reserved words.

Apparently it does not, however, allow the user to define his own abbreviations and expansions.

A tabbing facility that allows the user to move from field to field on an input line is said to be helpful when editing source statements or data entries. An automatic field sequence generator coupled with an ability to change lines at random within a program is "especially useful" when modifying programs.

The package, said to operate in the 8200's user partition with "plenty of space left over," is available under perpetual license — including one year's support — for $450.

Sage is at 2323 S. Sheridan, Tulsa, Okla. 74129.



IF YOU'RE MAKING FINANCIAL DECISIONS WITHOUT TIMELY INFORMATION, YOU NEED THE MMS GENERAL LEDGER.

When your financial management makes decisions without accurate, timely information, they might as well be blindfolded.

But you can give your decision-makers *all* the information they need, in *any* format they feel comfortable with, and deliver with fast-ball speed.

All you need is the MMS GENERAL LEDGER. The proven financial reporting system, it's scoring an impressive record in more than 800 major corporations around the globe.

A data-base system, MMS GENERAL LEDGER knows how to handle all the league-leaders, including DOS, O/S, IMS, IDMS, DL/1 and TOTAL.

If your requirements need a heavy-hitter, the MMS GENERAL LEDGER is available with an additional *ON-LINE MODULE* that makes financial reporting a whole new ball game.

Best of all, MMS GENERAL LEDGER is only one member of Software International's all-star team, which features Accounts Receivable, Accounts Payable, Net Change MRP, Filetab Report Writer and three for Systems/3 — General Ledger, Accounts Payable and Accounts Receivable.

When the pressure is on and you can't afford mistakes, call or write Software International. Get the champion performer, MMS GENERAL LEDGER.

Take me out to a whole new ball game of financial reporting. Please send me more information about:

☐ MMS General Ledger
☐ MMS Accounts Payable
☐ MMS Accounts Receivable
☐ Net Change MRP
☐ Filetab Report Writer

Picking a Winner — Part 2

'Politics' Must Play Part in DBMS Selection

By Robert B. Chamberlain
Special to CW

The points touched on in 'Technicians Alone Should Not Select DBMS" [CW, Aug. 8] carry with them the implications of "politics" — and the people who discerned that fact are the ones who have a chance at implementing a corporate data base.

"Politics" in this context is not a dirty word; a political problem can only be met with a political solution.

In fact, the politics involved in a successful data base management system (DBMS) selection is likely to differ only in style from that which occurs in a "technician-only" setting. That difference may be seen as the politics of force of personality instead of the politics of organizational clout.

In the technical area, the dispassionate approach known as the "Delphi procedure" seldom seems to win out. A methodical if rather tedious and somewhat redundant means of DBMS selection involving matrices, installation-dependent weightings, etc., the Delphi procedure is a useful tool, but it has two drawbacks in a technical team environment:

- Weightings are meaningless if they refer to the current or converted applications environment instead of the projected data base environment, a likely occurrence in a heavily technical selection orientation.
- The rigorous methodology is likely to be scrapped when a team consists, as it just about always does, of three or four close associates or the same number of strong egos.

The real resolution of the selection, then, is by force of personality, generally reflective of status within the organization. Sometimes, however, sheer strength wins.

This occurs when only one individual survives a marathon meeting called to "choose the damn thing and get on the road." He will stumble out with his face covered with stubble, mumble the lucky vendor's acronym and then, since most of the organization was not aware of the momentous nature of the meeting, fade into obscurity, along with the technical groups' choice.

An obscurity which, it can be observed, was predictable by the very nature of the team's composition. As to what that composition should be, let's look first at who the team's leader or chairman should be. The prime rule is, if the chief executive officer doesn't know the name of the selection team chairman, he'll never know the results of the team's effort.

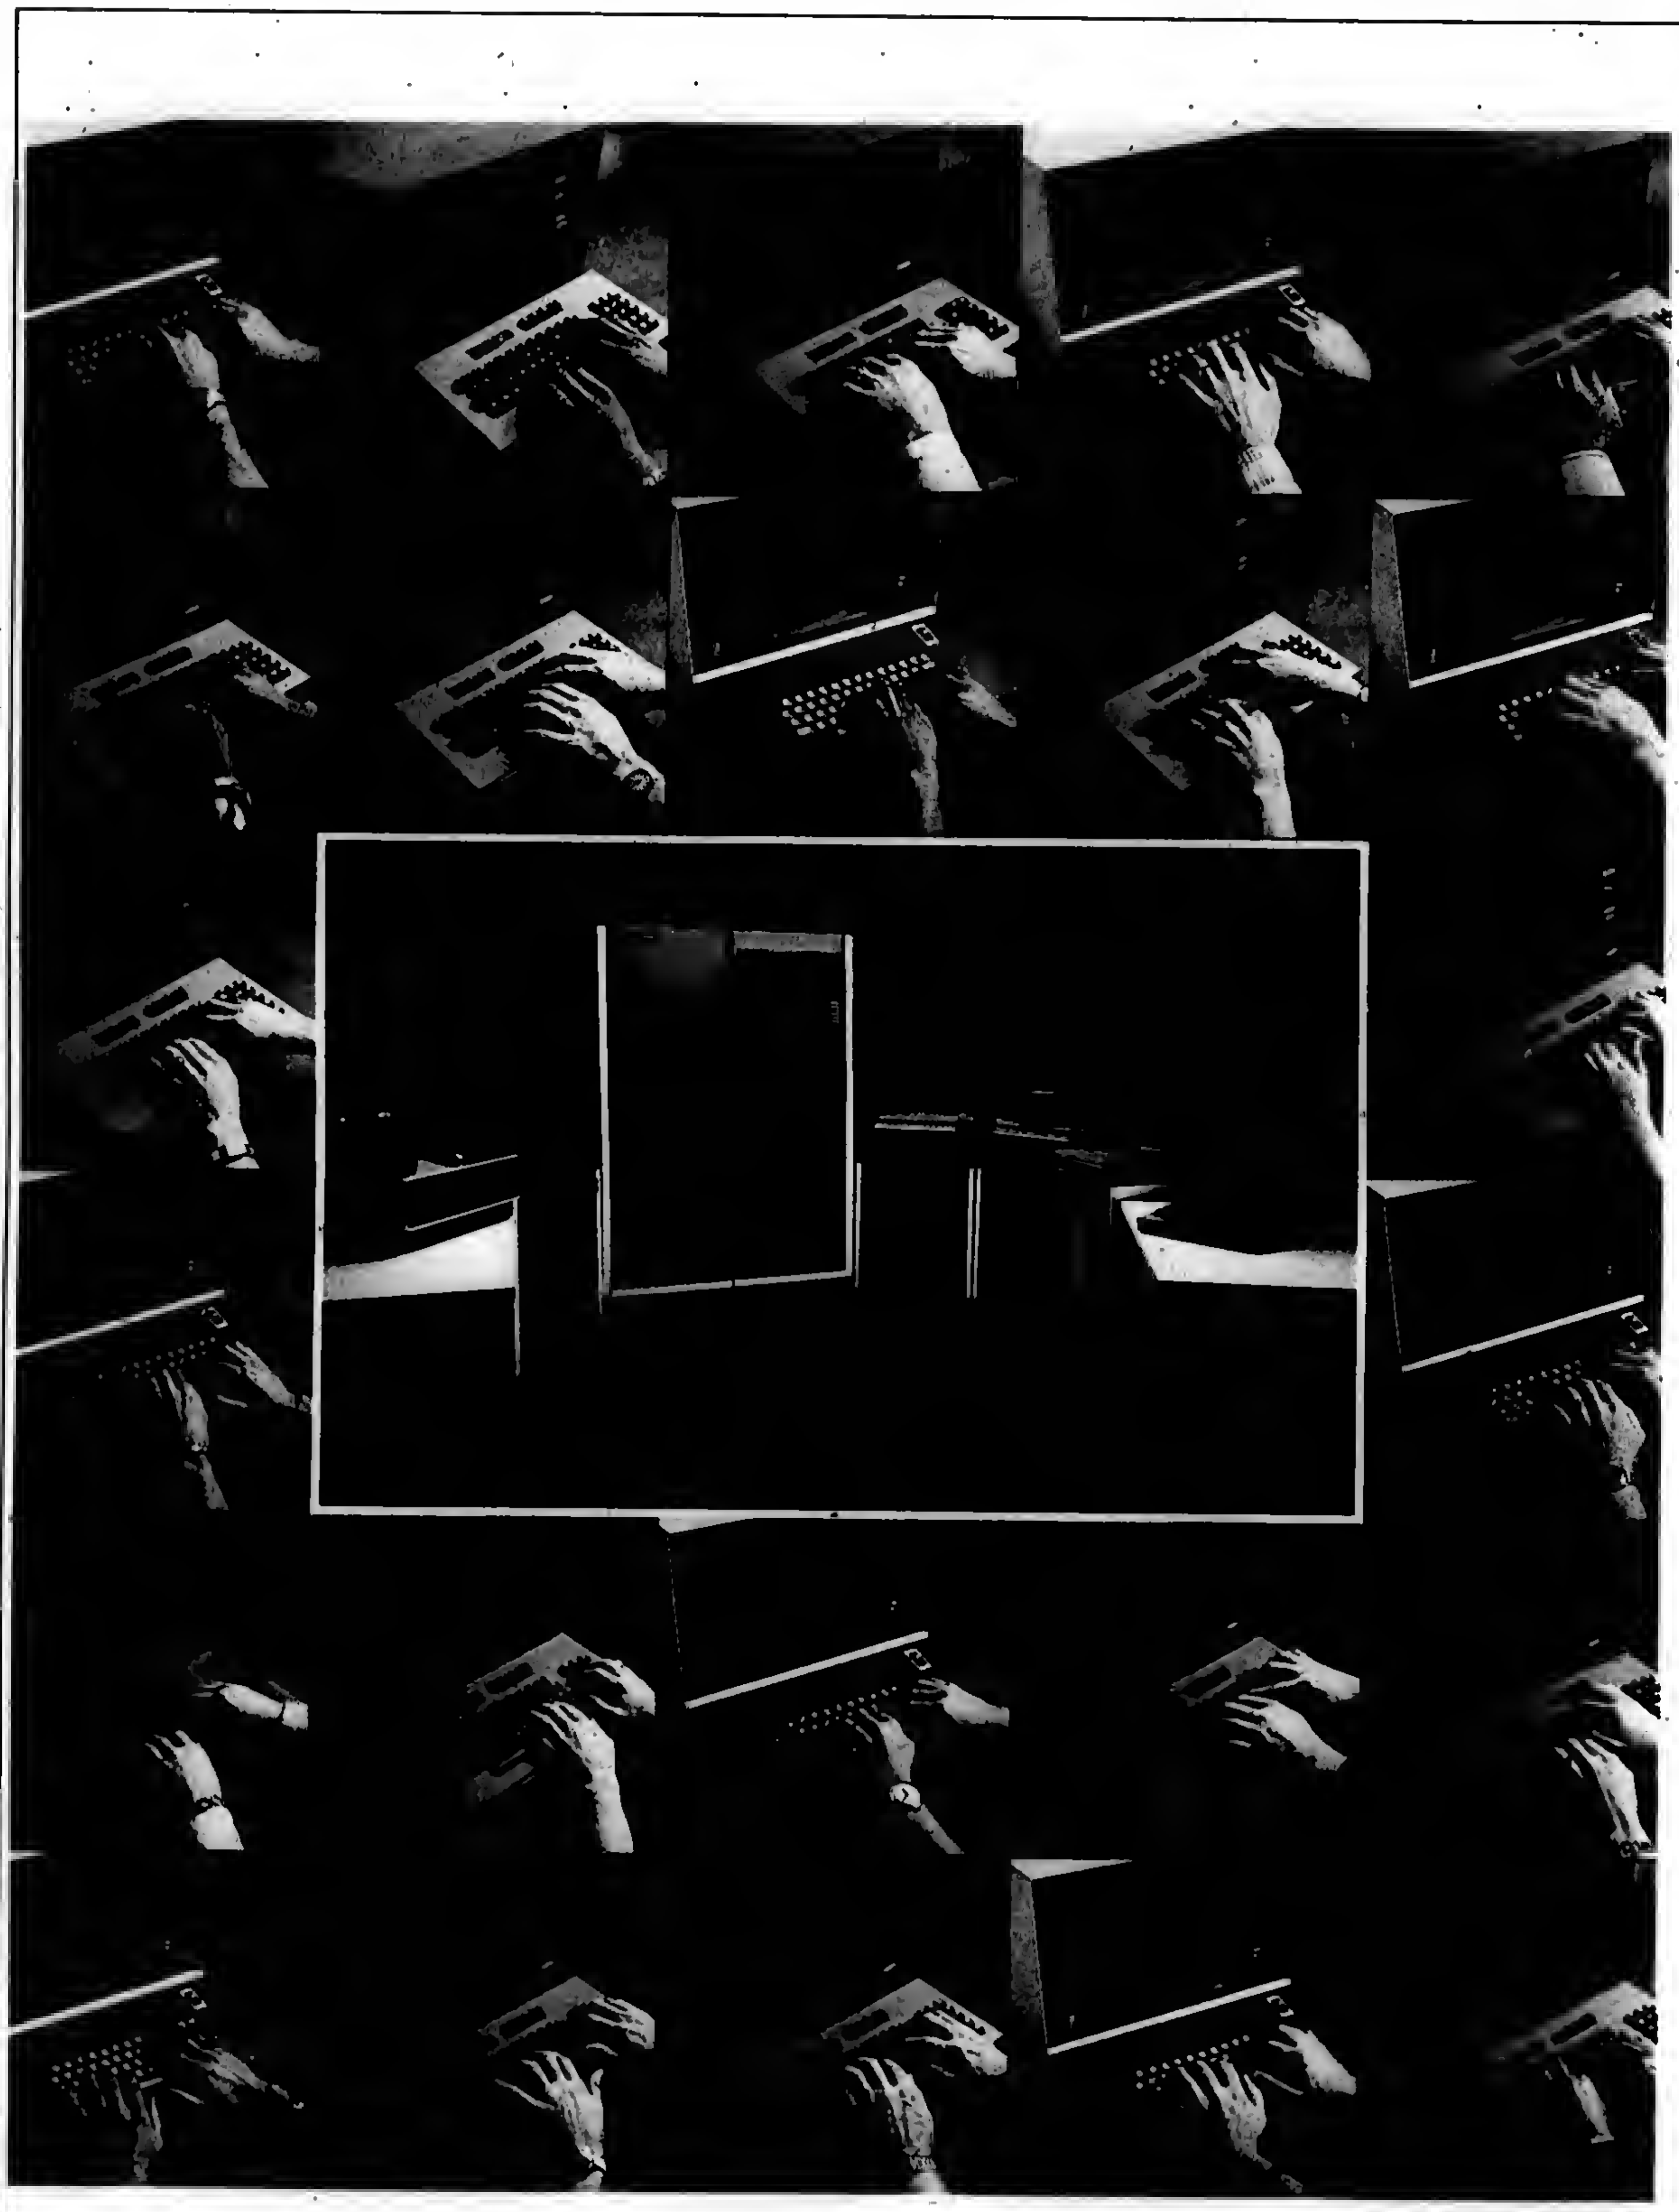
Data Basics

In other words, the team must be associated with an individual who is strong enough to command attention in the firm and whose leadership indicates that corporate commitment to DBMS is firm.

Other team members would include a chief analyst (preferably one with both a sturdy disregard for the status quo and the ability to quantify new requirements), a chief technician; a user representative appointed by the chairman; and a person from the operations section who can provide direction on such useful ordinary subjects as forms usage, current report distribution, etc.

All team members should be senior enough to call on personnel within their own areas as various aspects of the prep-

(Continued on Page 21)



NOTICE OF REQUEST FOR PRICE

The State of Indiana, Department of Administration, Data Processing Division, is accepting sealed proposals on a financial-leasing agreement on an IBM 370/168-M33 Computer System, part of which is currently installed and the rest on order from IBM due for installation in August, 1977.

The proposal includes purchase from the State of an installed IBM 3165-II Model K Computer System.

Proposals must be received in room 507 at the State Office Building Indianapolis, Indiana, by 10:00 A.M., Legal Time, August 18, 1977.

For additional information contact Charles E. Woodard (317) 633-4690.

Module of Month Plan Has Language Option

SADDLE BROOK, N.J. — Users in a range of environments may find low-cost solutions to a variety of DP problems through the Module of the Month (M/M) Division of National Data Systems, Inc.

Under the M/M plan, modules are available in a choice of ANS Cobol, RPG-II or IBM Assembly language for as little as $14.95 for a source listing or $19.95 for a listing and a machine-readable card deck, according to a spokeswoman.

The highest priced module now is $24.95 or $34.95, she noted. All orders must be prepaid to allow the division to continue these prices, she emphasized.

The division publishes a newsletter describing its software. Despite that and its "clubby" sounding name, however, the plan does not involve memberships, minimum purchases per year or automatic mailings unless the user notifies the division otherwise, she added.

The most recent routine available through M/M is Csort, which manages in-memory sorts with "any combination" of ascending or descending keys. Based on a bubble-sort algorithm, it is said to require much less memory than the internal sort that invokes "the usual sort utility."

For a limited time, Csort is available under M/M's $14.95/$19.95 pricing, the spokeswoman said.

Other modules include a Julian/Gregorian date conversion and perpetual calendar subroutine; a Modulus-10 check digit subroutine; and Tallyall, a utility for column-by-column analysis of data.

The data conversion routine works "in either direction" and includes a determination — and printing — of the day of the week of the date, if desired.

Tallyall is the most substantial of the routines now available and it carries the $24.95/-$35.95 price. In all cases, the card decks can be furnished in either 80- or 96- column format.

Requests for the M/M newsletter and orders for the modules should be addressed to Module of the Month, National Data Systems, Inc., 299 Market St., Saddle Brook, N.J. 07662.

All at once, it's Harris.

Harris now delivers the most cost/performance effective multi-use computer system in the industry.

Our new family of high performance systems—S115, S125 and S135—together with our powerful VULCAN Virtual Memory Operating System supports more than 50 terminals. Simultaneously.

This is a whole new line of medium-scale, multi-use systems with increased reliability and new state-of-the-art technology. You get greater I/O throughput. MOS memory with error correction. Powerful micro processor based CPU. Broad selection of highly reliable peripherals. And all operate with ANSI 74 COBOL, FORTRAN, RPG II, FORGO, SNOBOL, and extended BASIC.

The Harris S100 systems take on many different jobs all at the same time. Multi-stream batch processing. Multiple concurrent RJE's, both host and remote. Multiple interactive time sharing. Real-time processing. And this new generation of high performance computer systems from Harris delivers these all to you, *concurrently.*

If your need is distributed processing, time sharing, data base management, or any type of concurrent multi-use application, *benchmark our new computer system against any other system in the industry.*

Harris Computer Systems, 1200 Gateway Drive, Fort Lauderdale, Florida 33309. Telephone (305) 974-1700. Europe: Harris Intertype, Ltd., 145 Farnham Road, Slough, SL1 4XD, England.

All at once, it's Harris.

aration for the actual selection take place. No weighting of each team member's influence should be construed; each plays his own role in the process.

The chairman, in concert with the others, makes the final decisions and they become corporate decisions.

A team of this type has a much greater likelihood of effecting a successful transition to data base because it contains the key ingredients of organizational support and careful planning. It should be incumbent upon all would-be data base shops to carefully consider the options discussed and learn how they can affect successful implementation.

Chamberlain is senior consultant, information systems, with CACI, Inc. — Commercial in New York. He is now on temporary assignment in Europe.

"IDMS has the best documentation."*

*say users in Datapro study

In the fourth annual Datapro Research survey of software users. Cullinane's IDMS was rated #1 among all Database Management Systems. #1 in Overall Satisfaction. #1 in Ease of Use. #1 in Ease of Installation. #1 in Training. #1 in Vendor Support. And #1 in Documentation.

Being tops in documentation isn't easy. It takes serious commitment. It also took a big investment, and outstanding technical writers, editors and production specialists to create the best DBMS documentation in the industry. Through the dedication, enthusiasm and leadership of William Casey, a vice president of Cullinane Corporation, our documentation team has a long list of important developments to its credit.

This past year alone they've introduced: 1. Quick-Reference Cards for programmers and DBA's. 2. IDMS Database Design & Definition Guide. 3. IDMS Installation & Operations Guide. 4. IDMS Concepts & Facilities Guide. 5. Regular Technical Bulletins, including hints on system use, etc. 6. IDMS Programmers Reference Guide. And that's just part of it.

For the complete story — including technical literature on IDMS and a schedule of seminars for your area — complete this coupon or phone us at (617) 237-6600.

Think twice. You'll pick the database system users rate #1.

Cites Limitations

SNA Survival Short, Expert Predicts

By Ronald A. Frank
CW Staff

DALLAS — IBM's Systems Network Architecture (SNA) cannot survive as a viable architecture beyond the next few years, according to Howard Frank, president of Network Analysis Corp.

Speaking at a recent meeting of the Computer & Communications Industry Association here, Frank described to industry executives the limitations that exist in the structure of SNA.

Even though IBM touts SNA as the architecture of the 1980s, this is "virtually impossible" because of its current inflexibility, Frank said. Unless SNA capabilities are upgraded, SNA will be "the most archaic architecture around" when users want to be able to freely attach minicomputers, maxicomputers and terminals to their networks.

One of SNA's biggest limitations is that arbitrary point-to-point communications within a network cannot be accomplished easily, Frank said. He attributed this to the primary/secondary status required for stations in an SNA configuration.

"Stations must have either primary or secondary status. These stations are usually not software-programmable, but are preprogrammed at the time the network is put in place," he noted.

This means the user often cannot go from point A to point B because point A may not be in the hierarchy chain, he explained.

SNA configurations generally require a terminal to communicate with its own host CPU before a line can be established to a terminal attached to another host. The capability that permits a terminal to go directly from its own domain to a second domain has been described in IBM's Advanced Communications Function (ACF), but it is believed the company has not yet demonstrated this is a network, Frank said.

According to Frank, other limitations existing in SNA are:

- The host software gets more complex as the network gets larger.
- The local loop required for certain SNA terminals is cumbersome became if a single terminal goes down the entire loop goes out unless the user builds in alternate paths.
- Timing issues in the SNA loop requiring everything to be "sensitively tuned."
- The loop configuration has throughput problems because its capacity is much higher than if the net were constructed with a "tree-type concept."

User Optimizes Phone Network With Computerized Switching

DALLAS — Southland Corp. is beginning to solve many of its telecommunications problems with the help of a computer-based switching system for managing long-distance telephone communications.

The Datapoint Corp. Infoswitch system installed last March already has presented Southland with a $20,000/mo reduction in long-distance telephone costs, reduced waiting times for outgoing calls and helped cut the average call length, according to Jerry Edwards, Southland's manager of communications.

The system also is providing the company with the kind of detailed traffic information it needs to improve its expanding communications network, Edwards said.

In addition to being a large operator and franchiser of self-service convenience stores in this and three other countries, Southland owns and operates a chain of specialty food shops, three food-processing centers, 12 regional dairies and a truck leasing firm.

Until a few years ago, the conventional telecommunications facilities employed at Southland were adequate. However, an expanding volume of traffice between the company's divisional and regional offices and its corporate headquarters here, combined with higher line tariffs and steadily increasing long-distance costs, soon outmoded those facilities.

When Edwards joined Southland a little over a year ago, he was faced with a challenging situation. "The telecommunications program at Southland was not very well defined and we were without the kinds of communications information it would take to design and implement an effective corporate program," Edwards recalled.

"Our only telephone facility, a 701 Centrex, provided us with nothing in the way of accumulated line-usage statistics or comprehensive traffic analyses. Since the configuration of our previous switchboard facilities would not allow us to process and route incoming calls, approximately $35,000 a month was spent on operator-assisted calls coming into the Dallas area," he continued.

"Also, a traffic study conducted by the telephone company shortly after I came to Southland indicated utilization of the company's seven national outbound Wats lines was only about 60%, with queuing times ranging anywhere from one and a half to two hours," he said.

"Obviously, we had to find a way to reduce the cost and maximize the effectiveness of our long-distance telephone facilities. But we were also looking for a call management system that would provide us with line-usage data and call detail with which we could design a more effective nationwide communications network," he said.

After an extensive study of Infoswitch and two other telecommunications management systems, Southland decided the Datapoint system could best meet its long-distance telephone switching and management needs,

Switch Helps User Reduce Telephone Costs

(Continued from Page 23)

Edwards said.

The Infoswitch system installed at headquarters includes a Datapoint CPU (which Datapoint won't identify) with 48K user memory, a 5M-byte disk for program and accounting data storage and an 80 char./sec Datapoint Freedom printer for permanent copy report generation.

It also has an intelligent real-time controller that manages all the details of call placement and a reed relay matrix for telephone line switching and all other necessary line interfaces.

The main processor console is equipped with a typewritter-style keyboard plus an 11-key numeric pad, five control keys and a 960-character CRT display.

"The system installation was extremely smooth. The equipment was installed on Friday, tested over the weekend and in full operation by Monday morning," Edwards said.

"In the beginning we were bothered by a few minor problems — static electricity problems and telephone company interfaces that needed adjusting — but these were pinpointed and corrected almost immediately by Datapoint's customer service personnel," he recalled.

The elimination of unauthorized calls, increased availability of outgoing long-distance lines, effective routing of calls over least cost facilities, a reduction in the number of switchboard attendants and more detailed call-accounting information have added up to substantial savings, according to Edwards.

"Before we acquired the Infoswitch, nearly 29,000 outgoing long-distance calls — which equaled about 130,000 minutes of calling time — were being processed a month. Each of these individual calls lasted about 6.9 minutes and the average queuing time for a call was about an hour and a half," he said.

"A great deal of money was wasted on Wats lines that were either inaccessible or only partially utilized. Now that Infoswitch has provided us with an extended and flexible route selection of economical line facilities, we have cut our costs by more than half," he claimed.

"With this kind of savings in time and money, we have been able to eliminate two outgoing national Wats lines and four intrastate Wats lines and reduce our switchboard operating staff from three to one."

Because the management system maintains a detailed accounting record of each outbound long-distance call — including the date, time of day, caller identity code, destination telephone number and call duration — unauthorized calls have been discouraged or eliminated.

Infoswitch also has reduced the queuing time for a call to under 30 seconds; maintained a constant flow of traffic over all outbound Wats lines, and helped reduce average call length from 6.9 minutes to 4.1 minutes, according to Edwards.

Call Control Routing

Southland is also using the system to control and route Wats line calls coming into the Dallas area from locations throughout the rest of the country.

In Southland's system configuration, all 10 of its national inbound Wats lines terminate on the input side of the Infoswitch. To prevent call blockage or excessive queuing times, these Wats lines are matched with 10 tie lines running from the management system to the Centrex facility.

"Previously," Edwards noted, "all inbound long-distance calls were operator-assisted (third-party billing, credit card and collect calls) and the cost was approximately $35,000 a month. Now, with the use of the Infoswitch, we are processing the same number of calls and perhaps more for about $15,000 a month."

The system is also equipped with a set of maintenance diagnostics in microprogrammed memory. If any component fails a diagnostic test, the exact position of the failing board is indicated on the control panel for immediate location and replacement by the communications manager or service technician.

"When it came to choosing the Infoswitch system, the maintenance factor was a big plus, Edwards noted.

"The system virtually does all the maintenance for me. Not only that, I can replace a failing circuit interface board without shutting the system down.

"The system requires only one type of circuit interface board, whereas the other systems required a different type board for each type of line facility utilized."

The Infoswitch system has profited Southland in a number of ways, Edwards concluded. "The detailed accounting and line-usage data provided by the system has enabled us to accurately assess existing and future communication requirements. Most important of all, the ability to communicate quickly and efficiently is enabling Southland to maintain an aggressive posture in an extremely competitive business world," he said.

Azurdata Adds Service Plan

RICHLAND, Wash. — Users of portable order entry terminals from Azurdata, Inc. can now select a Full-Service Program that ensures timely maintenance and provides management reports to monitor both terminal performance and service costs, the company said.

Azurdata is located at 1100 Jadwin Ave., Richland, Wash., 99352.

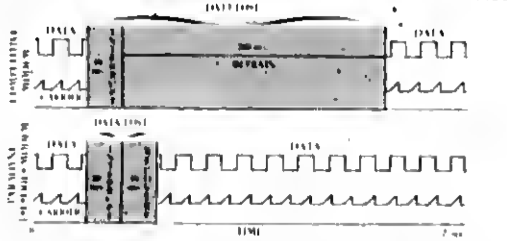
MODEM USERS:
FIND OUT WHY ONLY ONE MODEM CAN OPERATE AT 9600 BPS ON UNCONDITIONED LINES.

It's true. Only Paradyne's LSI Series modems let you operate a high-speed point-to-point network at 9600 bps on Bell 3002 unconditioned lines. The time and money saving features available in Paradyne modems are made possible by the all-digital circuitry, based on LSI technology, that is incorporated in every LSI Series modem.

Consider train time—the time it takes a modem to adjust itself to the condition of a line each time a transmission is initiated.

Paradyne uses a feature called "bridging" to eliminate about 80 per cent of the retrain time that a modem goes through each time a line is interrupted or a high error rate occurs. Instead of retraining, as other modems do, LSI Series modems "bridge" the initial train for up to two seconds—usually long enough for the problem to go away.

Consider dial back-up. Most modem suppliers offer it—but at lower data rates. With LSI Series, you get dial back-up at 9600 bps. Now add a few other features—like field upgradability from 4800 to 7200 to 9600 bps. Or channel subdivide, up to four 2400 bps lines per modem. Or a 15,000-hour MTBF made possible by the reliability of all-digital design.



The "bridging" effect of the Paradyne modem reduces retrain time by approximately 80% when a line interrupt occurs. LSI Series modems "bridge" an initial train for up to two seconds after interrupt, so data keeps transmitting rather than being lost while the modem retrains.

Or options like alternate voice mode and two-call dial back-up. Then add price: $115 a month for an LSI 9600 bps modem. And delivery: within one week. And service: direct from Paradyne. Now, try to find another high-speed modem that does all that. You can't. So send us the attached coupon, or call our nearest sales office. Paradyne modems let you do it all, right now.

OUR LSI MODEMS LET YOU DO IT RIGHT NOW.

Tell me more about the LSI series.
☐ I have an immediate need for 9600 bps modems.
☐ I have a longer-term need, and would like to speak with a salesman.
☐ Please send me literature

Multiterminal Packet Net Being Built in Netherlands

LRIJSWIJK, The Netherlands — A minicomputer-based packet-switching network is being built for the Rijkswaterstaat (water control department) of the Dutch Ministry of Transport and Public Works.

Called the Communications Network (CNET), the system is described as the first packet-switching network in Holland. In mid-1978, it will service existing local and remote terminals, of several differing types, by allowing them to communicate with Rijkswaterstaat's central computers located here.

In 1979-80, CNET will provide communications between several Dutch ministries' networks of the Dutch Postal Telephone and Telegraph Authority. This will enable sharing of the existing large computer facilities.

At that time, CNET will act as the primary data transport for a number of monitoring and control projects currently being planned or in development on a national scale. These include projects to collect and process data on river water quality and flow rates and to measure the characteristics of Dutch coastal waters, according to a project consultant.

A major advantage of CNET is that it will take care of all necessary communication protocol conversions.

The network design will be based on the principles adopted in the switching nodes of the European Informatics Network (EIN). EIN is an international packet-switching network designed and implemented in 1974-75.

New concepts will be incorporated in CNET, including the use of the CCITT recommended X.25 protocol incorporating a virtual call service.

CNET hardware includes a Univac 1100/40 and two Philips P1400 mainframes. Minicomputers will be Digital Equipment Corp. PDP-11/34s with 48K words of core memory and communications interfaces.

Of the five PDP-11/34s, three will function as host interface processors for the mainframes while the remaining two will operate as switching nodes for terminals in the network and will connect to two of the three host interface processors.

Connection between the minicomputers will be over 4,800 bit/sec lines with the majority of terminals operating on private lines.

SNA Limitations Cited by Expert

(Continued from Page 23)

The SNA structure sets up "enormous complexity in the host," Frank said, referring to the fact that teleprocessing software modules are shared between the CPU and the 370X front end. The number of software modules of the Vtam access method that reside at either processor depends on the specific network configuration, he said.

There is no one that understands the cost/performance trade-offs of an SNA net and "no one really understands the economics involved," he said.

Frank also outlined the dependence of a 370X on a specific mainframe and said this is a liability when the CPU is not operating. Other networks such as the Arpa net have shown that it is possible to build front ends that can operate with multiple CPUs, he noted.

"I don't know of very many people that have SNA working," he said. "I've been told there are 85 SNA installations, but these are all in the development stage rather than in the operational stage."

IBM reportedly has tried to overcome the terminal -host dependence by allowing an operator to establish an alternate path to a second CPU. But this is not a viable solution for unattended sites or networks with hundreds of terminals, Frank said.

At last.
The small business systems nobody's waiting for.

Data General's new Commercial Systems CS/40 models. They don't keep you waiting because they work the way business works. Interactively.

Multiterminals, no waiting. CS/40 puts data processing power right where your people need it, when they need it. In a distributed network or as a standalone system handling multiterminal applications or multiple single terminal applications or both. So some users could be updating inventory, while others enter orders, check payables, and process the payroll. All at the same time. And managers can still access the system any time.

It speaks your language. Interactive ANSI '74 COBOL, the standard business computer language and the language of large computers. With its COBOL, CS/40 has interactive debugging and workstation management, which makes it easier to use from the start.

Small doesn't mean limited. Three compatible models assure that as your company grows, CS/40 can grow along with you. And CS/40 can communicate with other popular commercial systems including our own. With features like up to 40 million bytes of online disc storage. And enough memory for large applications. Plus utility software you wouldn't expect on a small system. And a smart spooler that frees up terminals so your system can do more work.

And everything else you'd expect from Data General. Like innovation, because we put a larger share of our revenues into R & D than any other major computer manufacturer. Like reliability, because we make virtually everything we sell. Add attractive quantity discounts, solid systems engineering, field service and our superior price/performance and you'll understand why there are already over 39,000 systems installed worldwide.

Why wait any longer?

Mail to: Data General, Westboro, MA 01581

☐ Send me your Commercial Systems CS/40 series brochure.

☐ Send me your brochure and have your sales representative call.

☐ Quick, I'm getting ready to purchase. Call me pronto.

Data Entry Conference Set for October

NEW YORK — The First Annual International Data Entry and Distributed Data Enry Conference will be held Oct. 17-19 at the Waldorf Astoria here. The conference will be sponsored jointly by the American Management Associations (AMA) and the Data Entry Management Association (Dema).

The AMA/Dema conference will concentrate on the human side of data entry and distributed data entry, according to a spokesman. There will be seminars conducted by authorities with the latest information in the field; panel discussions to present different viewpoints about common problems; and workshops to enable conference members to exchange ideas and experience, he said.

Some of the topics scheduled for the three days include "Motivation and Communications," "Data Capture," "Performance Measurement and Quality Assurance," "Implementing a Data Conversion" and "Managing and Controlling a Distributed Data Entry Environment."

Dema members attending the conference will have an opportunity to participate in that organization's first annual business meeting, the spokesman noted.

Additional information and registration details can be obtained from Marilyn Bodek at Dema, 16E Weavers Hill, Greenwich, Conn. 06830.

Clean Design Ends 'Powerful' Problems

By Warren Lewis
Special to CW

There are a great many DP professionals around who know about the requirements for clean, stable power in a computer room.

There are also a lot of electrical contractors and consultants around who are very good at designing electrical power structures for buildings and industrial plants.

Unfortunately, the electrical people and the DP people do not communicate well when it comes to designing the power structure of a computer facility.

I have spent many years with the facilities planning staffs of several major computer manufacturers, and I can attest to the fact that, more often than not, the power structure of the computer room is inadequate as originally designed. The result of this poor design is that the computer starts having intermittent problems — often referred to as "mysterious computer failures."

Typical failures occur when the computer mysteriously halts, the computer goes to wrong addresses, garbage comes out of the computer and when programs will run some days and not others. When the installation problems are more serious, safety can be involved or rotating equipment such as disk drives can be damaged.

IBM states in one of its customer engineering manuals that about 40% of the input power receptacles in customer locations are initially phased improperly. This can cause equipment damage — or such fun things as disk drives rotating backward.

Sometimes a problem as basic as inadequate power occurs. At other times, the environmental controls interact with the computer controls. At times like this, it is not unlikely for the computer to do something funny every time the air conditioner cycles.

Most electrical contractors will tie the computer room into the standard building wiring. This almost assures the power into the computer room will not be clean.

The problem is usually caused by multiple tie-ins to the building ground structure. Transients on the normal building wiring are sure to get to the computer. Most electrical designers have a gross misunderstanding of what a computer grounding structure should look like.

Normal grounding structures are designed for electrical safety and cost. This usually

(Continued on Page 29)

CMC Changes Leasing Policy

LOS ANGELES — A number of pricing policy changes in the lease structure of its Keyprocessing systems has been reported by the CMC Division of Pertec Computer Corp.

For CMC 3, 5 and 6 Keyprocessing system customers who execute or extend a lease to a term of 24 months or longer, CMC is offering software features for multiple formats, reformatting, tape entry and data validation at no charge, according to a spokesman.

For its CMC 7, 9, 12 and 36 customers, CMC is offering lease rate discounts of 5%, 10% and 15% in lease renewals for an additional one, two and three years respectively.

An overall 2% increase in Keyprocessing lease rates on new leases, renewals and extensions became effective July 1, the spokesman added.

CMC is located at 12910 Culver Blvd., Los Angeles, Calif. 90066.

Art Depicting Early DP Offered

SANTA ANA, Calif. — People in DP centers who are tired of seeing swirls and sworls from plotters and graphic output from printers adorning the walls as "decor art" may be interested in an offering from the *Data Entry Digest.*.

Ronald G. Henderson, editor of the publication, has a limited original collection of drawings that depict turn-of-the-century DP activities. The drawings were made from original photographs and publications found in archives in different parts of the country, he said.

The five drawings in the set depict the use of the original keypunch and card sorter, as well as persons using early telephones and dictating machines. The series includes a sketch of the "boss" sitting behind his rolltop disk, Henderson said.

The drawings will be furnished in two sizes, one poster size and one framing size. Each set will be numbered and signed by the artist.

A set of both size drawings costs $39 from the *Digest* at 10522 Ridgeway Drive, Santa Ana, Calif. 92705.

You Get the Best Compact Terminals from CDI Because That's All We Make.

When it comes to compact printing terminals, we only know how to make the *best*. The MINITERM family!

We put extra design and engineering effort, plus the highest quality materials into our products so you get the most out of them.

You get more features and more quality in every CDI model. It all starts with the **Q-3 thermal printer** for OEM's, heart of the MINITERM family, followed by the **MINITERM 1201 Receive-Only** terminal, then the **MINITERM 1202 Desk-top terminal** and the **MINITERM 1203 timesharing portable** with acoustic coupler and exclusive three-way keyboard. And introducing the *NEW* **MINITERM 1204 ASR,** with Random Access Memory and integral magnetic tape cassettes for off-line data preparation and high-speed editing.

The most features, highest reliability, greatest versatility per dollar; that's the only way to make the *best* terminals in a compact package.

Get them all — and only — from CDI. Call or write today for the CDI office nearest you.

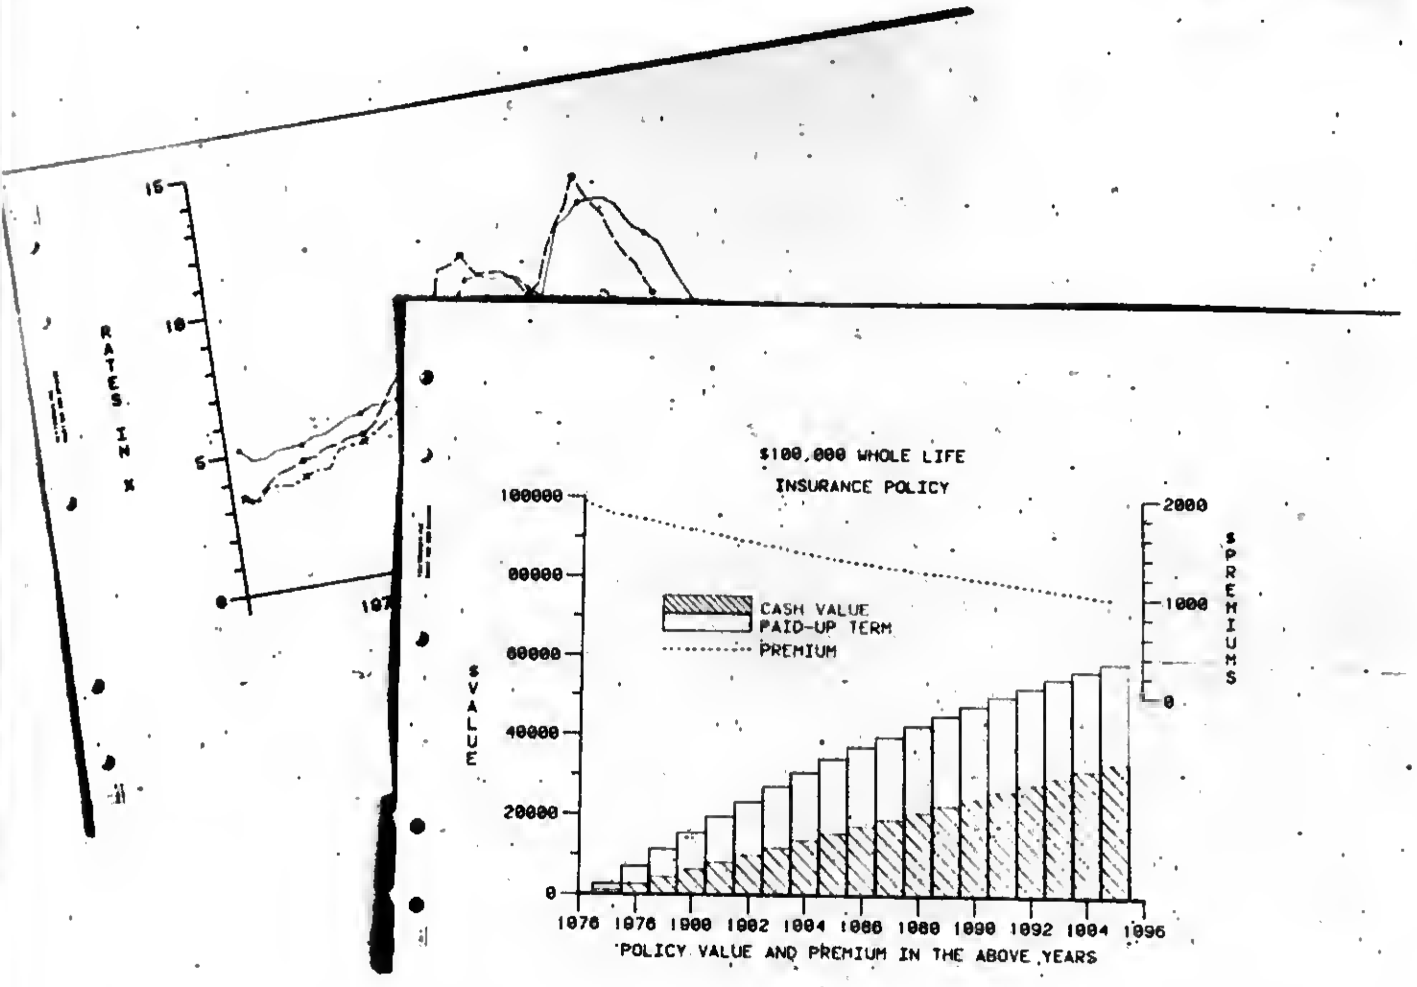
TEKTRONIX 4662

"There's no plotter like it. My terminal easily commands any graphics."



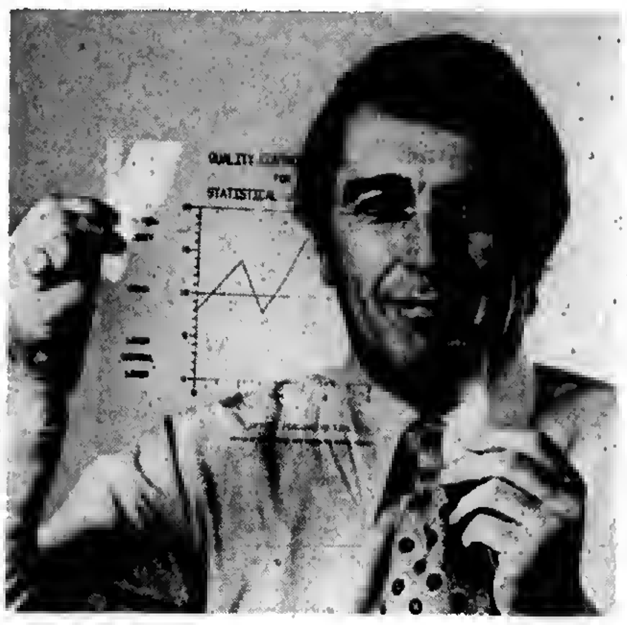
Problem: You'd like computer graphics, but not at the price of adding more terminals. So you continue to use paid personnel to hand-plot charts, graphs and diagrams.

Solution: Tektronix 4662 Interactive Digital Plotter. Plugs into most terminals for precise, multi-colored graphics. The 4662 plugs into almost all RS232-C or GPIB-compatible terminals. Use the 4662 to prepare graphics on paper or mylar for sales meetings, program presentations. With computer accuracy and unexpected economy. Plus multiple colors from felt tip or wet ink pens.

Easy interface to timeshare environments. Thanks to its built-in microprocessor, Tektronix modems, and Plot 10 software, operation is simple, accurate, and faster than any other plotter at the 4662's low price.

Don't ask your people to do a plotter's job. Get a graphics specialist that pays for itself. Because the 4662 is from Tektronix, the worldwide graphics leader, you're assured of exceptional reliability and fast service wherever you are. Talk to your local Tektronix Sales Engineer now, or call toll free, (800) 547-1880.

Tektronix
COMMITTED TO EXCELLENCE



The 4662 can draw precise plots on mylar or acetate, offering an especially valuable graphic assist to overhead projectors.

Bad Power Design Causes CPU Problems

(Continued from Page 27)

results in a minimum-code design.

This minimum-code structure is often subject to ground loops and other horrors faced every day by computer service people. What is needed is a single-point ground structure that not only meets the safety codes, but also the performance requirements of each computer manufacturer.

The Security Factor

Elaborate precautions are usually taken to protect the integrity of computer facilities. Unfortunately, the power to the facility is generally left out in the open, where anyone can get at it.

It is not surprising to find an isolation transformer in the janitor's closet or even out in the parking lot. If the transformer is tampered with, the whole computer facility goes out.

Why is this security gap allowed? Simply because very few even know that the gap exists.

Another farce is often documentation. After the power structure is installed and the electricians leave, there is rarely anyone who can trace problems in the wiring. If any documentation is provided, it is generally inadequate.

In addition, the wiring is often poorly labeled and difficult to trace. It can — literally — leave the DP manager in the dark.

This is poor human engineering. Even the electrician who originally installed the room usually can't come back six months later. and easily trace a problem.

Build and Hope

The best an electrical contractor can do is design an electrical structure for a computer room, build it to code and hope it works.

But there is a better way. The alternative is to gather all of the electrical power apparatus in one place inside the computer room, put it in a cabinet and lock it up tight. The computer room people then have total control over the power structure. Nobody else can get to it, modify it to defeat its purpose or damage it.

The answer, than is to put the computer power in the hands of the computer professionals. Nobody else is sensitive to the unique problems that exist in a computer room. An electrical person will argue that the computer is "just another load" on the electrical system. It's not; it's much more critical.

In 1967, at Xerox Corp. we melded our knowledge of the computer room's unique requirements with our knowledge of electrical power and designed the first power center. A power center is programmed to provide the proper voltages and currents to all of the equipment in the computer room.

In addition, it isolates the computer equipment from spurious signals in the building wiring that can keep the computer from working properly. It can even turn off the computer equipment in case of a safety hazard in the building.

The first prototypes were tried at Xerox in 1969. During 1971 and on through 1973, a significant number of Xerox computers were switched over to power centers.

Companies now provide power centers that can be used with any brand of computer equipment. At such companies we think of ourselves as partners with, rather than replacements for, the electrical consultants and contractors who are so necessary for overall facility design.

Lewis is vice-president of engineering with Computer Power Systems Corp. of Long Beach, Calif.

Printer Configures System To Produce Complete Pages

By Frank Vaughan

CW Staff

DALLAS — A yearbook publisher here is using a medium-scale mainframe as the heart of a multivendor system that creates page positives complete with text, photo areas and art rules.

Taylor Publishing Co. officials refer to the system as "Pagination" because it sets and positions type, blocks out space for pictures and numbers each page. There's no need for the traditional cutting, pasting or positioning by hand, a spokesman noted.

Taylor has used the system since 1972 to turn out full pages of type and picture layouts for 1.2 million original pages each year.

"This system has given us a tremendous edge over our competition," according to Randolph B. Marston, Taylor's president.

Marston estimated the Pagination system contains about $5 million worth of hardware and software.

"We found there wasn't a system on the market that could do everything we wanted in copy preparation and typesetting. We had to create it ourselves," Marston recalled.

"We put our ingenuity to work and purchased the most advanced equipment available at the time, then we designed the software and hardware to utilize it to the fullest advantage," he said.

The system is built around an IBM 370/145 configured with 256K bytes of IBM memory and 256K bytes of add-on memory from Cambridge Memories, Inc. The CPU processes text and page layout data, performs hyphenation and justification and computes the proper location of all elements on a page, the spokesman said.

The mainframe is equipped with seven Telex Corp. 6316 disk drives, four California Computer Products, Inc. Model 235-11 double-density disk drives, five Telex 6420 Model 7 tape drives, two Telex 5403 printers and two IBM 2540 card readers.

Tape generated by the 370/145 is used to drive a Harris Corp. Fototronic CRT typesetter that turns out pages ready for film stripping and plate making.

Digitizing, which is common in engineering and scientific applications but is unheard of in publishing circles, is part of the pagination process, according to the spokesman.

Taylor's digitizing system is based on a Texas Instruments, Inc. 980B minicomputer configured with 65K bytes of memory. Complementing the mini are 12 Summagraphics Corp. digitizing boards, 12 Tektronix, Inc. 613-1 graphics display terminals, one DS-330 disk drive from TI and a Printronix, Inc. line printer.

The system enables an operator to copy the layout of a yearbook page and transfer it to permanent disk storage in about 45 seconds. A layout is made when the text in put in place, pictures are scaled for size and positioned and horizontal and vertical rule markings are inserted.

Each operator is able to check the accuracy of the layout on a display terminal, the spokesman noted.

While the layouts are being prepared by the digitizer, text input is accomplished through a Recognition Equipment, Inc. Input-80 optical character reader. Copy prepared on an IBM Selectric typewriter is read by the scanner at a rate of 12 page/min. and transferred to magnetic tape. The type size and style is specified at the same time.

The tapes from the digitizing system and the optical character recognition operation are eventually processed by the 370/145 and the information is merged on a single tape for use on the Fototronic typesetter.

In 10 seconds, the spokesman said, the Harris device produces a full page positive containing the text, picture areas and art rules.

The 50 Million Dollar Award...
ICP's highest volume recognition... ewarded exclusively to Cincom's TOTAL DBMS.
The Software Honor Roll...
Dalapro's certification of quality... user surveys made TOTAL the only DBMS 3-time recipient.

Quantity. Quality.
More evidence of TOTAL acceptance.

So often in life, one must choose between quantity and quality. User success with the *TOTAL Data Base Management System* proves that *both* benefits accrue to the organization who selects TOTAL as the foundation for its information system requirements.

Nearly *2000 installations worldwide*... from efficient minis to the largest maxis... have demonstrated that the capabilities, ease of use, and power of the TOTAL DBMS can be applied successfully to nearly any operating environment. Inputs, feedback, and suggestions from this large and diverse user base insure an *exceptionally stable product*...so important in the world of data base processing... and a continuous *emphasis on product enhancements*. This is what mekes quantity and volume es represented by the ICP 50 Million Dollar Awerd meaningful.

With nearly *four times* the number of user reports submitted than the next leading DBMS product, TOTAL received high marks for *overall satisfaction*...recording a rating of *3.5* on a scale of 4.0... in the Datapro Research survey. Other major factors in this independent survey include throughput/efficiency, ease of installation/use, documentation, and vendor training/technical support. Such user recognition brought TOTAL its *third Honor Roll award*... *unique* among DBMS. Quelity and consistency are what makes this tribute meaningful.

If you are planning your organization's move into data base, and, if quantity acceptance coupled with consistent quality are most important to you, why not contact your local Cincom Systems representative today?

Believer in Multiple CPUs Says

Two Minis 'Express' Data to Truckers

By Esther Surden
CW Staff

CARLISLE, Pa. — "I believe in multiple small systems because when the big one's down, everything is down," Dick Guyton, DP manager for Daily Express, Inc. said in explaining how his firm has evolved into a user of two on-line minicomputers and one batch-oriented small business system.

The company is a specialized truck carrier that hauls truckloads of farm gear, heavy machinery and construction equipment.

The batch system, an NCR 101, is used to perform accounts receivable and payable, contractor settlements to pay contractors who deliver the loads, a self-insurance program and fuel tax reporting as well as to keep track of any areas with which regulated companies have to comply.

The two on-line Microdata Corp. Reality systems perform a motor truck dispatch application and also do the billing, accounts receivable and payable and check-clearing activities for two other divisions of the company.

Daily Express had been computerized with the NCR equipment since 1970, but decided it needed to go on-line to keep track of its motor dispatch application, Guyton said. Prior to the installation of the systems, dispatching had been done manually.

"We were handling the application with little pieces of paper stuck in slots in the wall," he recalled. "We had a plastic card that represented a trailor, and we had a 4 by 6 card that represented a power unit. Then, when we wrote up the work order, we would match the appropriate tractor with the appropriate trailer and put the load card with it.

"Then when you made an entry on the loadcard, you had to look for it, write the entry on it and then pass it over to the entry department. So a lot of time was spent searching" for the card, he said.

On-Line Dispatching

Because communications costs were rising when it couldn't find the information needed to respond to phone calls and because it was having difficulty keeping track of its equipment, Daily Express turned to an on-line dispatch system.

An extensive search that took about two and a half years narrowed the field of available systems down to the Microdata Reality, Hewlett-Packard 2000, Interdata 8/32 and the Digital Equipment Corp. PDP-11. The Reality was chosen because of its operating system, Guyton said.

The first system was purchased from Keystone Data Systems, Inc., the Philadelphia-area Microdata dealer. A second system was bought later.

One of the on-line systems has 64K of memory and includes 25M bytes of disk storage, a magnetic tape system and 24 communications ports. The other, also a 64K system, has only 20M bytes of disk, tape, 18 communications ports and a printer.

The firm has about 28 CRTs in-house. Outlying sites communicate with the system via 13 Decwriter teleprinters, several Teletype machines and CRTs.

Programs Written In-House

Programs were all written in-house in Basic, Guyton noted, because there were no packages available for "what we wanted to do." The Microdata English language is used for ad hoc report generation, he added.

Users of the dispatch application access an integrated data base which includes a load file, tractor file and trailer file. When the sales department receives an order, it keys the information into the system through its CRTs.

The data entered includes load information and a complete description of the job. "We don't have a hard-copy load card, in effect," Guyton pointed out.

The information is then made available to the dispatchers. Scanning CRTs at their locations, they determine what resources are available, what loads they have to move and when they have to move them and then assign equipment.

The act of assigning equipment simultaneously updates the tractor file, trailer file and load file, Guyton said.

When a trucker calls in after the truck has been loaded, the dispatchers input the actual weight and delivery date as well as any other information he might need to complete the delivery or the firm might need to produce a bill.

When the trucker empties the load, he calls a dispatcher, probably located in a remote location. The dispatcher keys in the driver's unit number and enters any final billing information needed.

The system also produces management re-

(Continued on Page 33)

Mini Bits

Iota Has Alarm Feature To Alert System 32 Users

PROVO, Utah — Iota Computer Services, Inc. has a device that reportedly alerts IBM System 32 operators when the system needs human attention.

Called the Hawkeye Sentry, the device is said to notify an operator when a system detected blinking error occurs or when the operator is in an interactive data entry mode and hasn't entered data for a significant amount of time.

The audible notification is repeated every 15 seconds until it is acknowledged by the operator.

The alarm can be disabled by pressing a stop button on the system control panel if the system is validly idle.

The Hawkeye Sentry is user-installable and costs $285. It will be available in the fourth quarter from Iota, which can be reached at P.O. Box 1321, Provo, Utah, 84691.

Seminar Set on Warehousing

CHESTNUT HILL, Mass. — A seminar on minicomputer systems for warehousing/distribution operations will be given Sept. 14-16 at the Management Institute of Boston College's School of Management here.

The seminar will attempt to tell managers "how real-time interactive information can be used to improve productivity in receiving, distribution, back-order handling, inventory control, stock order locater systems and scheduling, among other applications," a spokesman said.

Leading the seminar will be Stephen A. Levine, president of The EDP Corp.

The sessions cost $425. Additional information is available from the Seminar Administrator, Management Institute, Boston College, Chestnut Hill, Mass. 02167.

Lockheed Systems Get Disk

PLAINFIELD, N.J. — Lockheed Electronics Co., Inc. has enhanced its small business system III with the addition of a floppy disk.

The subsystem is said to be compatible with the IBM diskette and may be read or written by the IBM 3740 or 3600 subsystems.

The unit features a transfer rate of 250 bit/sec and an access time of 11 msec per track. It costs $3,675 from Lockheed in Plainfield, N.J. 07061.

Report Urges T/S Over Mini

WELLESLEY, Mass. — "Investing in your own computer — even a minicomputer — isn't always the answer to your data processing needs" is the warning issued by "Points to Consider Before Selecting a Computer," a free booklet available from Keydata Corp.

The firm, a commercial time-sharing service that also provides on-line business DP services to wholesalers, distributors and manufacturers, noted that "realistic estimates of the cost of installing a modest-size minicomputer range between $60,000 and $70,000, plus monthly charges."

Calling the purchase of an in-house system "a sizable risk many small companies don't want to take because computer failures can literally put small companies out of business," the firm urged users to consider on-line time-sharing.

Software is the unpredicatble element in minicomputers, the report said. "When something goes wrong with a program after it is written or the software needs some other modification, only trained programmers can make the necessary changes," Keydata cautioned.

Producing applications software is a complicated matter, the report continued. "Minicomputers, because of their size and capability, actually require more complex programs than many large computers, and the development and debugging of this software is basically an operation performed by highly skilled programmer/technicians whose wage rates are continually rising," it said.

In the majority of cases, a minicomputer requires an operator. Since most businesses are dynamic, they require alterations in both hardware and software, necessitating the hiring of an outside software firm or the development of in-house technical expertise.

"Either option has its difficulties," the report said. "Many software firms make their profits from marketing computers rather than software. Thus their primary focus tends to be on developing software packages for new accounts, rather than maintaining software already installed.

"These firms have a high mortality rate, so there is no real assurance the one you select will be available continuously to handle your software requirements," the report added.

"On the other hand, finding and managing a good technical staff also presents problems because good people are in short supply becasue of the rapid growth of the industry."

The report offers a checklist of costs that are most likely to occur with the installation of an in-house system and covers some hidden costs, such as the cost of supplies, security, air conditioning, personnel support, parallel-operation equipment, documentation and hardware insurance.

The report is available from Keydata at 20 William St., Wellesley, Mass. 02181.

Adding OCR to Mini Speeds Remittance Task

EUGENE, Ore. — Optical character recognition (OCR) equipment hooked to a minicomputer has helped Liberty Communications here solve a complex remittance-processing problem.

The firm, a cable television company, previously gathered customer payments at 32 field service offices. The payments were then forwarded to a service bureau for processing, according to Carolyn Chambers, vice-president and treasurer of the company.

When a customer called in with a question concerning his bill, Liberty could not provide a quick answer because of the way the remittance processing was being performed, Chambers recalled. Sometimes it would take 15 days to bring the records up to date, she added.

A consultant, William T. Geoghegan, was hired to help find a solution to the problem and give the firm better control of its accounts.

After looking at various solutions, such as the possibility of having the customers send back coupons, both the consultant and Chambers agreed OCR would be the best solution.

Most OCR systems were too expensive or too complex to be cost-justified for use with the firm's minicomputer, Chambers noted.

From an advertisement and from an exhibit at the National Computer Conference, the company became aware of the Datareader from Key Tronic Corp. of Spokane, Wash. The firm purchased the system because of its low cost and the location of the vendor's manufacturing plant, Chambers said.

Liberty has over 100,000 customers geographically dispersed across the country who are billed on a bimonthly basis. The Datareader handles the entire remittance-processing routine.

Processing Routine

The application requires the scanning of a remittance payment stub printed in the OCR A font and the associated check. Two fields, the account number and amount field, are scanned on the remittance stub. This information is printed twice on the same scan band to ensure reading accuracy.

Upon receipt of the remittance document and check, the operator verifies that the amount due and the check amount match. Those that don't — about 2% — are set aside for manual key entry.

The operator then drops the remittance document into the top drop feeder and the check into the bottom of the duel-drop feed unit for scanning and processing by the Datareader.

If an error occurs, the Datareader automatically stops the processing operation, sounds an audible alarm, clears the data from its output buffer and does not transmit any of the data from that document to the CPU.

The operator will run the same document through an additional two times to make sure it cannot be read. If the document is still rejected, it is set aside to be manually entered:

Eighty percent of all documents are read on the first pass and 40% to 50% of the remaining documents are read on the second pass, giving the system a successful read rate of 90% to 95%, Chambers said.

Key Tronics standard check-processing routines are available for processing checks in this application. Chambers expects to process between 2,000 and 2,500 sets of documents per day at a 90% read rate with the single OCR unit. Liberty has purchased a second unit to accommodate its annual growth.

Liberty is using a Hewlett-Packard Co. 3000 series II computer as its processor. The Datareader with RS-232 interface is directly on-line to the asynchronous RS-232 I/O port on the HP 3000.

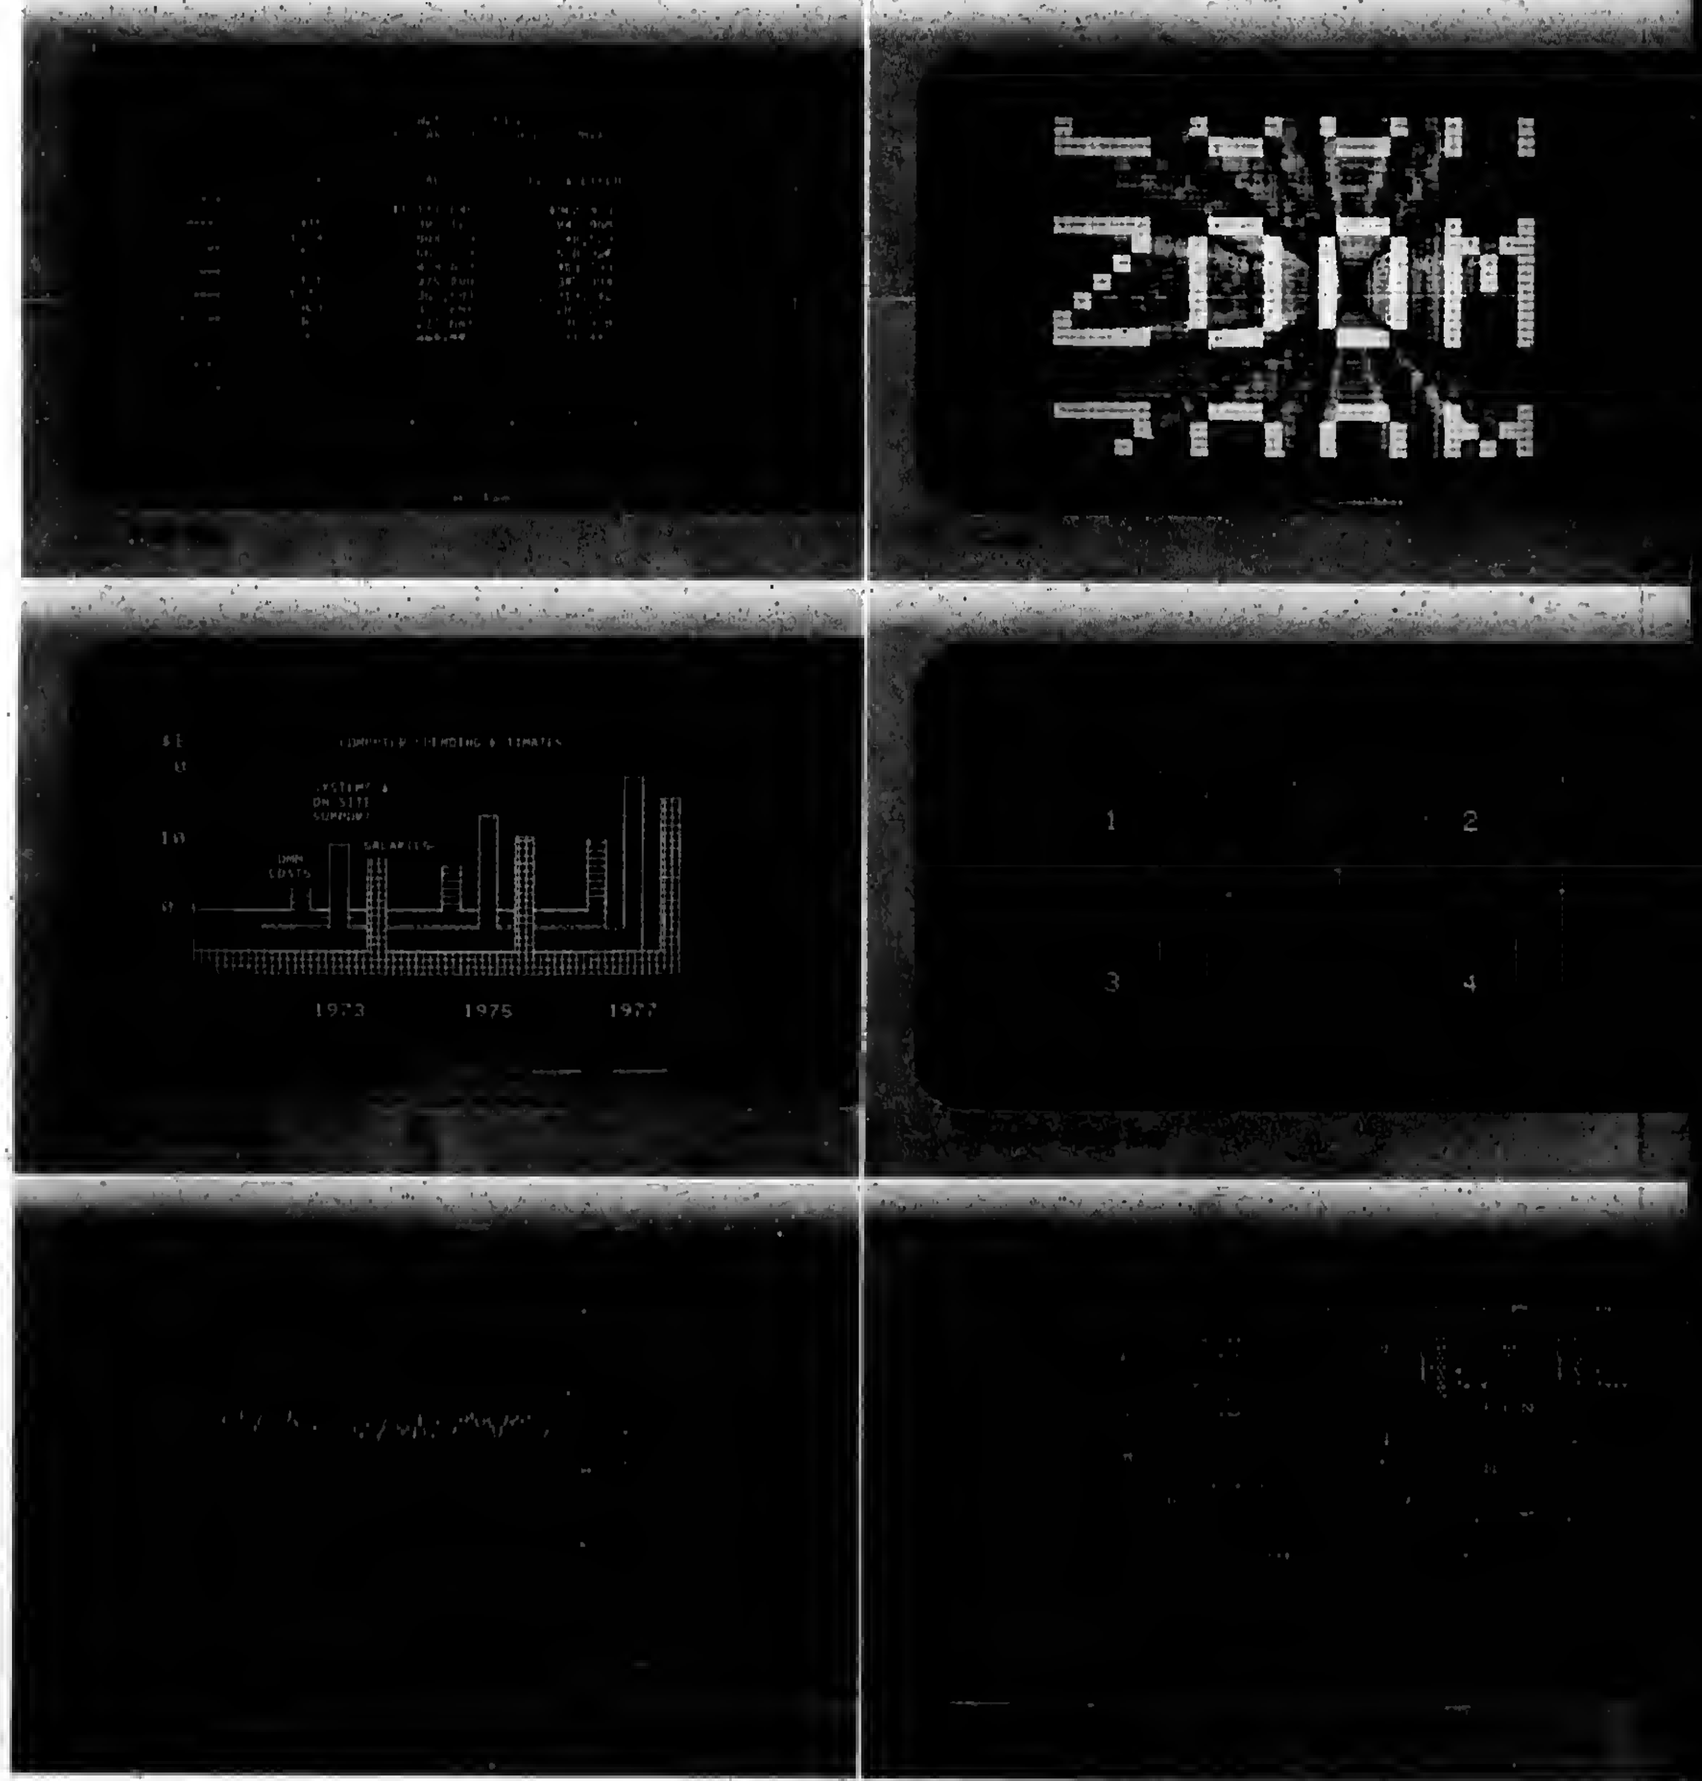
Hewlett-Packard brings a bright new look to low-cost graphics.



STC Turnkey Enhanced

PARAMUS, N.J.— Storage Technology Corp. (STC) has enhanced its turnkey minicomputer-based business system with the addition of'an English-like language that "allows a nonprogrammer to compeltely specify the requirements for new report programs in minutes."

The language, dubbed English 210, is said to be free-form and easy to learn. The operator responds to step-by-step prompting messages at the bottom of the CRT screen to define report parameters shown at the top of the screen.

Any turnkey systems delivered by the firm in the last 18 months which include the STC Double Precision Executive can be retrofitted with the language for $3,200, a spokesman said. Otherwise, the price is bundled into the turnkey price, he added from E-210 Rte.4, Paramus, N.J. 07652.

DEC Users Get Clock Boards

PALO ALTO, Calif. — Digital Pathways, Inc. has two battery-powered accessory boards that provide calendar and real-time clock functions for Digital Equipment Corp. PDP-11 and LSI-11 minicomputers.

The units keep track of the correct date and time even when the mini's power is turned off, a spokesman claimed.

There is no need for the operator to enter time or date information at any time, thus reducing the chance of error, he added.

The TCU-100 for the PDP-11 presents date and time when a read instruction is given by the operator. It can be preset to interrupt at specified times or regular intervals.

It can also be used to keep track of system downtime, even during power failures, the vendor said.

The TCU-50 unit for the LSI-11 lacks the interrupt capability.

Both of the units can operate without computer power for up to three months on built-in rechargeable batteries. Each unit is contained on an edge connector circuit board that plugs directly into one of the mini's accessory slots.

The TCU-50 costs $325 while the TCU-100 costs $495 from Digital Pathways at 4151 Middlefield Road, Palo Alto, Calif. 94306.

Minis Move Data Quickly

(Continued from Page 31)

ports such as trailer utilization reports and a pattern report which shows equipment types needed by "origin state" and "destination state" that attempts to point sales people to where potential customers are likely to be located.

A position report gives the operations people and management an overview of what's happening and "is in effect a kind of a quickie backup.

"We are in the process of making it possible for the second system to absorb the workload of the first system" should the first system go down, Guyton said.

To do this requires a bit more disk storage. "We keep the 25M-byte disk on the dispatch Reality quite loaded, and the 20M-byte disk on the other Reality can't quite hold the system."

Anticipating a new operating system release for the system, Guyton said that as soon as it is distributed "we are going to dedicate the tape drive on the on-line system and, as we update a record, we will pass the updated records out with a peculiar key right to tape.

"That way, if we have a failure of the primary sytem, we would simply load the preceding day's saved files; update the files from the transaction log and be back in business."

Management information is transferred daily to the NCR system through tapes, he noted.

Microdata takes care of the service of the system, he said; and "I have had absolutely no problem with it."

The new Hewlett-Packard Graphics Terminal uses a microprocessor and raster scan technology to combine high performance with low cost.

The HP 2648A introduces a whole range of bright ideas to graphics. There's so much power built into the terminal itself that you can perform everything from auto-plots to zoom without any CPU help at all.

Auto-Plot. You don't need to know programming or invest in costly software. Once you've entered your facts and figures from the alphanumeric keyboard, press a few keys and your tabular data is plotted instantly.

Raster Scan. No more pulling down the blind to make your plots visible..Our display is clear and easy to read even in bright light. And the raster scan technology permits selective erase, cutting down the time it takes to modify your picture also.

Zoom and Pan. This lets you magnify any area of the display up to 16 times. And you can pan in any direction for closeup investigation of complex designs, without having to reinitialize the data.

Area Shading and Pattern Definition. This makes it easy to distinguish areas with similar shapes, such as bar charts, mechanical parts and architectural drawings.

Rubber-band Line. You can draw trial sketches, such as architectural floor plans, with or without CPU connection. Think of the time and money you'll save by cutting down mistakes.

Independent Display Memories. Both alphanumeric and graphic data can be shown independently or at the same time. And you can carry on a dialogue with the CPU without disturbing the picture.

The HP 2648A also has all the advantages of our popular HP 2645A alphanumeric terminal. Specifically: mass-storage on 110K byte cartridges (you can store graphics as well as data); 'soft keys' to speed up repetitive jobs; one-button self-test; plug-in PC boards for easy maintenance; extensive data communication and off-line capabilities.

This bright new look in graphic terminals is designed for such applications as electrical, mechanical and architectural design. For process and control. For scientific plots. And for business planning.

We'd like to give you a graphic demonstration of everything the HP 2648A can do. Send us the coupon and we'll set it up. Or contact the nearest Hewlett-Packard sales office listed in the White Pages. We're sure you'll get the picture.

HEWLETT hp PACKARD

Yes, I'd like to take a closer look at your low-cost HP 2648A Graphics Terminal.

Try One Trivex With Your 3270s Instead Of Biting The Bullet.

You'd like to replace your IBM 3270s with more versatile terminals. It'd make you a hero. But the first step is like biting the bullet because things could blow up in your face.

That's why Trivex invented the free 30-day Mix and Match Plan. It gets rid of the risk of obsoleting your system. Or hurting your user service reputation.

Here's how it works: We'll give you one of our Trivex Plus 70 terminals (or a system, if you want) to try for 30 days. Free. Just plug it in. There's nothing else to do because it's *completely* compatible with IBM 3270 units.

The same goes for our controllers and printers. So you can mix and match our equipment with IBM's any way you want to.

Then sit back and see how well it works. Our terminals not only cost less than IBM's, you'll find they give you more. Like in-line, on-line and off-line diagnostic capability. Local display-to-print capability. OCR Wand. High-resolution, non-glare CRT. And a low-profile, easier-to-use keyboard. Features you won't get from IBM for years. If ever. And all Trivex 3270-compatible devices are microprocessor controlled. They're software-modifiable to future changes in network requirements.

When your 30 days are up, either unplug our Plus 70 System and send it back or keep it. It's a painless decision.

To try our high-calibre terminals, call the number below or write us on your letterhead. Our sales rep will bring you information on our free 30-day Mix and Match Plan along with an Executive Decision-Making Kit complete with operating instructions and a real bullet.

It's one offer you should bite on.

57 Vendors Represented

Report From Datapro Details 144 Micros

By Frank Vaughan
CW Staff

DELRAN, N.J. — The microprocessor and its logical extension, the microcomputer, are still the most exciting technological aspects of the DP industry, according to a report published by Datapro Research Corp.

"And while these products continue to amaze us with their vendors' feats of packaging progressively greater performance into smaller packages...we are merely witnessing another cycle of technological innovation proceeding from its infancy, through the various stages of applicational discovery, into full maturity," the report said.

Entitled "All About Microcomputer Specifications," the report noted there is not too much difference between this year's microcomputers and last year's. Primary differences come in the form of fewer integrated circuit requirements and denser memories at lower costs.

Another development has been in the availability of specialized I/O interface circuits, such as diskette controller chips.

"By combining these innovations, the spectrum of microcomputer offerings has begun to take on the performance characteristics of small minicomputers in exactly the same way that the minicomputers have recently begun to function more like their larger mainframe counterparts," the report observed.

The report discusses microcomputer and microprocessor development systems and their outgrowths. It also looks at OEM and hobbyist microcomputers.

One trend that continues to surprise the industry observers is the rapid growth of the hobby interests, Datapro said. Starting with the Mits Altair 8800 (an 8080-based kit product) and followed by the Mits 680 and Southwest Technical Products Model 6800 (both 6800-based computers), the interest in home-built computer systems is expected to rival the interest in high-fidelity kits within a few years.

Several other companies have moved into this area and computer stores are springing up all around the U.S., the market research firm noted.

Micros in Detail

The Datapro report presents the characteristics of 144 current microcomputers from 57 manufacturers in comparison charts. The information is on systems that are currently being shipped or are scheduled to be shipped by the third quarter of this year.

All information was supplied by the manufacturers during April and May of this year, Datapro said.

The categories in the comparison charts include packaging, which includes the number of boards, board dimensions, total number of chips and information on the power supply, control console and cabinet; and the microprocessor, which includes manufacturer and model, technology, data word size, instruction word size, clock frequency, add time for register-to-register in microseconds per data word, number of instructions, total number of registers, microprogrammability and availability of hardware arithmetic.

Other categories include information on I/O control, software, principal applications, pricing and availability and comments.

A list of addresses and telephone numbers of manufacturers whose products are summarized is also included in the report, which sells for $12 from Datapro at 1805 Underwood Blvd., Delran, N.J. 08075.

Micro Bytes

Oliver Prom Programmer Handles TI 2708, 2716

N. HOLLYWOOD, Calif.— Oliver Audio Engineering, Inc.'s PP 2708/16 programmable read-only memory (Prom) programmer handles the Texas Instrument's 1K Model 2708 and 2K Model 2716 Proms.

The programmer contains address counters and timing and control logic and software. It also includes a power supply and case and five-ft cable, the firm said.

The unit can be connected with a parallel interface to a microcomputer.

The PP 2708/16 costs $249 in kit form and $299 assembled and tested from Oliver at 7330 Laurel Canyon Blvd., N. Hollywood, Calif. 91605.

Show Set in Boston

BOSTON — Computermania, a computer show for businessmen and computing enthusiasts, will kick off at the Commonwealth Pier here Aug. 25-27.

Featuring over 400 exhibits of computers, calculators, video games, video recorders, programs and accessories, Computermania will also include a display on ham radio by Tufts University.

Tickets cost $12 and can be obtained at the door.

Kit Backs Altair Clock

ALBANY, Calif. — Parasitic Engineering has a permanent fix-kit for the Altair 8800 microprocessor clock.

The fix-kit reportedly decreases the clock's susceptibility to noise, temperature drift and other component variations.

The fix-kit contains instructions, components and other necessary parts. It installs directly on the Altair microprocessor unit (MPU) boards.

The kit sells for $15 from Parasitic, which can be reached at P.O. Box 6314, Albany, Calif. 94706.

Reductions in 20% Range

Altair 680B, 8800B Prices Cut

ALBUQUERQUE, N.M. — The Pertec Computer Corp. has announced price reductions in the 20% range on a variety of Altair personal computing items.

The reductions were made as a result of "manufacturing efficiencies," according to a spokesman.

The 8800B microprocessor unit (MPU) in kit form was reduced from $875 to $750, while the assembled version with 12 board slots was cut from $1,175 to $995. The cost of the assembled version with 18 board slots was dropped from $1,250 to $1070.

The 8800B turnkey MPU in kit version was reduced from $995 to $795. The assembled 12-slot version of the turnkey was cut from $1,250 to $995, while the 18 board-slot unit was reduced from $1,395 to $1,070.

680B Kits Drop

The 680B microcomputer kit was lowered in price from $466 to $395 and the assembled model from $625 to $495. The turnkey kit form of the 680B dropped in price from $425 to $350, while the assembled turnkey went from $610 to $450.

The Altair line of microcomputers is sold through a network of Altair Computer Stores.

Midwesterners Set to Get Own Show

CHICAGO — Midwesterners will have a personal computing show of their own when the Midwest Personal Computing Show debuts here Oct. 27-29.

Attendees will have an opportunity to win a Processor Technology B-190 kit with 16K bytes of memory, a system worth more than $1,000, according to a spokesman for *Personal Computing Magazine*, sponsor of the show.

The show, which will be held in the Holiday Inn at O'Hare International Airport, will feature exhibits from programmable video games to inexpensive business management systems.

In addition to the product displays, a seminar program is being planned. The program will be of interest to entrepreneurs and businessmen who are interested in "getting a piece of the action in personal computing," the spokesman said.

Another event at the Chicago show will be "Everyone's Computer School." Conducted by Gene Murrow, president of Computer Power and Light, the "school" will teach the basics of programming to beginning users.

Participants will learn to program while sitting at a terminal, the spokesman noted.

Other seminars being planned include "New Approaches to Business Applications," "Introduction to Hardware," "Introduction to Software," "Computer Art and Music," "Computer Networks," "Computer Games of the Future," "Computing Is Schools," "The Home Computer — How Real is It?" and "The Threat of Government Intervention in Personal Computing."

The conference will conclude with a Saturday night banquet at the O'Hare Hyatt Regency Hotel.

Admission to the exhibit hall is $10. Additional information is available from *Personal Computing Magazine*, 401 Louisiana S.E., Albuquerque, N.M. 87108.

System Allows S-100 Vocal Input

LOS ALTOS, Calif. — A system compatible with S-100 bus microcomputers that provides voice input and control and reportedly replaces keyboards in many instances has been introduced by Heuristics, Inc.

Speechlab digitizes and extracts data from a speech wave form and applies pattern-matching techniques to recognize the vocal input, a spokesman explained.

Technically the system features 64 bytes of storage per spoken word and a vocabulary of up to 64 words in memory, he said.

Other features include real-time response, 95% correct recognition, hardware self-test capability and CMOS design, he claimed.

Software includes Speechbasic Basic programming language, an Assembly language speech-recognition program, Speechbasic plot, correlation, recognition and advanced recognition.

Speechlab is available for $249 in kit form and $299 assembled and tested. Included in the price is a complete hardware/software system, a 275-page laboratory manual, 95-page hardware manual, high-fidelity microphone and three programs on paper tape.

Heuristics is at 900 N. San Antonio Road, Los Altos, Calif. 94022.

Artec Board Goes to 32K

SAN CARLOS, Calif.— A memory board that can be built up in modular form to 32K bytes has been introduced by Artec Electronics, Inc.

The board is fully compatible with the S-100 data bus and speed-compatible with Zilog Z80-based systems, according to a spokesman.

The Model 32K-100 requires plus-8 single voltage only with a power usage of 3 amps, he said. Access time for the direct memory access (DMA)-compatible board is 250 nsec.

DMA compatibility allows users to access memory directly, without going through the microprocessor unit (MPU) on the microprocessor board, the spokesman explained.

The board, fully buffered on all address and data lines, also features battery backup to allow operation at reduced power consumption and a bank select provision permitting the selection of banks or blocks of memory to address.

The basic board with all support circuits, power regulator, 8K bytes of memory and assembly manual sells for $290. Additional 8K bytes of static random-access memory cost $255 each and a full 32K memory board sells for $1,055 from the firm at 605 Old County Road, San Carlos, Calif. 94070.

1702A's Burned.Quick, Reasonable. Call (617) 481-7383 for details.

MICROCOMPUTER SOFTWARE Real-time, multi-tasking operating systems available for the 6800, 8080 and PDP-11. Relocatable assembler/linking loader for the 8080 runs on 16-bit minicomputers and IBM 370. Industrial Programming, Inc. 9 Northern Blvd., Greenvale, N.Y. 11548, (516) 621-8170.

Absolutely brand new IMSAI 8080 with 12K, cassette & teletype Model 33 ASR. Available at 15% off. Call (800) 221-2628 or (212) 355-5040.

Zilog Adds Three Boards

CUPERTINO, Calif. — Zilog, Inc., has expanded its series of Z80-based microcomputer boards by adding three programmer boards that allow users to program memory chips, according to a spokesman.

The Z80-PPB/Eprom Programmer Board was designed for programming 24-pin erasable programmable read-only memory (Eprom) chips of the 2708 or 2704 variety.

Another offering is the Z80-PPB/Prom programmer board for programming 16- and 24-pin Harris Corp. programmable read-only memory (Prom) chips of the 7620, 7621, 7640 or 7641 type.

Each board has software that permits users to program, verify, list and duplicate; each costs $475.

A composite version of the two boards is the Z80-CPB/-Prom. It duplicates the software capability of the other boards and costs $575.

Zilog is at 10460 Bubb Road, Cupertino, Calif. 95014.

Parasitic Kit Built on 8080

ALBANY, Calif.— Parasitic Engineering has introduced an 8080-based microcomputer kit that sells for under $700.

The Equinox 100, according to a spokesman, eliminates the need for binary lights and toggle switches with its use of a 12-pad keyboard and a numeric 7-segment display.

Through firmware control, Equinox 100 users can utilize the front-panel keyboard and display to monitor or alter any register, register pair, memory location or I/O device in the system, he said.

The microcomputer can single-step through programs, slow-step at a programmable rate from 1- to 64K step/min or HALT at predetermined points without "going to sleep," he claimed.

The complete kit sells for $699 from the firm at P.O. Box 6314, Albany, Calif. 94706.

Kit Fans: Are You There?

The age of the microcomputer kit has dawned and the do-it-yourself computer has attained a degree of respectability that has surprised many people.

The concept of building one's own computer holds a great deal of interest for hobbyists and professionals alike. If sales figures can be believed, quite a few kits are in various stages of assembly throughout the country.

If you have either joyously succeeded or miserably failed at building a kit — or if you fall somewhere in between — and would like to share some of your experiences, *Computerworld* would like to hear from you.

Drop a short line to Frank Vaughan at *Computerworld*, 797 Washington St., Newton, Mass. 02160.

MICROCOMPUTING CLASSIFIED EXCHANGE

This special classified section in solid (non-display) format is designed for people who are working with or interested in microcomputing. Through it, you can buy, sell or swap equipment software or services; contact people with similar interests; start clubs; disseminate information; look for game partners; or send messages to other individuals. As the number of ads increases, this section becomes more useful; so we've tried to make ad placement as simple and inexpensive as possible. Details are as follows:

Ordering: The attached form will serve as the simplest way, we feel, to place your ads in Microcomputing Exchange. Please do not use it for other classified sections of Computerworld. They are display format and have different procedures and rates. Publisher reserves the right to refuse ads for this section, to limit the size of ads placed, and to limit the number of ads placed by any one person or company.

Payment: Must accompany your order. No exceptions. Your check will be accepted.

Copy and Closings: Deadline for copy to be in our hands is Friday, ten days preceding Monday issue. All copy must be submitted in writing (no copy taken over the phone), clearly typed or printed. We cannot be responsible for errors in printing made from illegible copy.

Rates: 80¢ per word. All words set in same size and typeface, up to first five words may be boldface. In making word counts, include name and address. Name of city (New York) or state (New Jersey) counts as two words. Zip code or phone number (including area code) counts as one word. (Publisher reserves right to omit zip code and/or abbreviate words if space is tight.) Count each abbreviation, initial, single figure or group of figures or letters as a word. Symbols such as RAM, CRT, etc. count as one word. Hyphenated words count as two words. No commissions paid to agencies.

Box Numbers: Are available at $5.00 per insertion. Send replies to box numbers to:

The New PCMs — Part 2

Microcode Seen Future Market Strategy

By Toni Wiseman
CW Staff

The ranks of plug-compatible mainframe manufacturers are swelling steadily as more and more vendors enter the market. Counterstrategies are expected from all sides — and a measured amount of retaliation is expected from IBM.

Just what the strategies of these plug-compatible manufacturers (FCM) will entail and how far they will go is open to conjecture. Industry observers, however, agree on one thing — microcode is going to play a large part in everyone's strategy.

Arthur D. Little's Frederic G. Withington said it isn't clear whether "the big guys are going to be able to fend off the little guys" by bundling systems programs through the use of microcode.

Amdahl Corp. in particular, he noted, is very imaginative, is spending money on R&D and will certainly have new hardware products. "And conceivably, with the help of Fujitsu, it may eventually be independent in software too, though that would be a long way off," he said.

"What we're seeing here is something that's never really forced itself on us before — the complete decoupling of software and hardware, with the operating system being the primary product, but being so big and so complex to change that it's vulnerable to attacks from every quarter," Withington stated.

The virtual machine concept is the way for mainframers to compete, according to Elinor Gebremedhin, project editor at Auerbach Publications said. She suggested that a viable strategy would be to design a machine in such a way that the user could put an operating system on it that would be effectively identical to the IBM operating system.

"Right now, mainframe manufacturers are tied up in their architecture design by the necessity to emulate their previous offerings," Gebremedhin said. "But they're freeing themselves from this constraint by developing the virtual machine. The problem is to do it efficiently enough to avoid performance degradation."

James Peacock, vice-president of International Data Corp., sees problems ahead for both users and PCMs as microcode and predesigned circuits handle more and more software functions. For this reason, he predicted, plug-compatible machines are only a short-term solution.

"Looking at it from the user's standpoint [plug-compatible CPUs] are a very good solution for users who are committed to IBM software, but this approach presupposes the availability of IBM software," Peacock noted.

This is the second article in a three-part series that takes a look at the competitive plug-compatible mainframe market.

Part 3 will examine the competitive scene from the viewpoint of securities analysts who follow the industry.

As hardware and software become more and more intertwined, a plug-compatible machine could create problems for the user who wants to keep up with IBM, he said.

"All that the PCMs are saying now is that if you're running IBM software, they can save you money on your hardware. If I, as a user, feel the system I have, or this type of system, is going to be adequate for the next five years, and I am willing to live with the type of software I have, then this looks like a very attractive approach.

"But if I am up against a wall, if I have problems that I don't think I can handle with the current architecture of the machine and I'm looking to IBM or some other manufacturer for a new solution, that's another story.

"In that case I wouldn't think I as a user would be very secure in going to an IBM-compatible machine, because I would think I wouldn't be able to get whatever IBM offers," Peacock explained.

Art Yerkes, Datapro Research Corp.'s mainframe editor, also believes the virtual machine is the likely strategy. With microprocessor machines it is entirely feasible, if somewhat difficult, to design a machine which could run

Study Finds SBS-Type Ventures Need Large Infusions of Capital

By Toni Wiseman
CW Staff

PALO ALTO, Calif.— The telecommunications industry is characterized as being highly capital-intensive and requiring long-term capital investment — implications evident in the Satellite Business Systems (SBS) venture, according to Comquest Corp., a market research firm.

The partners in SBS — IBM, Comsat General Corp. and Aetna Life & Casualty — have projected expenditures in excess of $680 million by 1986, when the seven-year life of the first generation of satellites ends, Comquest said.

Of this amount, $250 million will be pre-operational expenses for the period up to July or August 1979. The remaining $430 million will be expended in the operational phase to 1986, the report said.

Approximately 60% of the total expenditures will be for plant investment, including satellites and earth stations; the remaining 40% will be for administration, marketing and other operating expenses, Comquest noted.

A more detailed breakdown from the firm showed 18.9% for the space segment, 12.8% for 5-meter antenna stations, 8.5% for 7-meter antenna stations, 1.4% for systems management facility, 16.8% for system development, 26.5% for administration and headquarters, 10.8% for operations and maintenance and 4.3% for spare parts.

Comquest analyzed the expenditures and revenue requirements resulting from the installation of 375 earth stations by 1983. "For a simplified break-even cash flow analysis through 1986, required average monthly revenues needed to accrue to SBS for each earth station would be $28,500," it reported.

In Comquest's estimation of SBS' break-even condition, the maximum negative cash position will occur in 1981, with net cumulative expenditures of some $330 million — 10 years after the founding of the original CML Satellite Corp. and six years after the founding of SBS.

"With all earth stations installed and producing revenue, the system revenues' requirement for break-even would be approximately $127 million per year.

"Assuming an income distribution from

Member SIA Software Industry Association

Study Finds Communications Capital-Intensive

(Continued from Page 37)

both IBM services roughly proportional to demand for equivalent voice circuits, the annual system revenues for the breakeven case would be: low-speed data, $12.2 million; medium-speed data, $16.3 million; high-speed data, $35.8 million; voice circuits, $62.7 million," the report observed.

"With the revenue-producing features of demand assignment and voice activity compression, these numbers appear attainable for SBS when compared with private-line revenues for other domestic satellite operators," the report stated.

Entry into domestic satellite operation is theoretically open to any company which has the financial staying power and the available technology, Comquest indicated, citing Control Data Corp., Burroughs, Honeywell, Univac, NCR and possibly Memorex, Dataproducts or Ampex as potential candidates.

"In general, computer companies will be well-qualified technologically in the areas of digital signal and digital data processing. In addition to this technology, they will also require the satellite communications technology in order to even qualify for [Federal Communications Commission] (FCC) construction permits," the report stated.

This means a computer-based firm can either develop in-house capability or form a partnership with a communications-based entity, it noted. While Comsat-General is an obvious potential partner, RCA, Western Union and American Satellite Corp. are also viable, it added.

Satellite equipment manufacturers such as Collins Radio Group, Hughes Aircraft and ITT Space Communications are also possible partners for joint ventures, it said.

"Comsat-General's association with IBM would not necessarily rule it out as a venture partner with another computer manufacturer," Comquest observed. "However, Comsat-General's ability to take on the added financial strain is questionable.

"The financial investment for 'rooftop' satellite operation will probably incur a peak negative cash flow of $250 million to $350 million including space and ground segments."

Foot in the Door

Comquest suggested computer-based firms could get their foot in the door by using SBS' common carrier facilities as soon as they become operational — traffic SBS will be obligated to accept as a common carrier.

"This will allow experimentation with the direct transmission of high-speed data from computer to computer via satellite — without having to reduce to voice-band rates the multimegabit per second internal transmission rates of the computer," the report said.

What about IBM and its required "arm's-length" relationship with SBS?

At present 45 (51%) of the 88 members of the SBS staff are employees.

"This situation cannot be allowed to endure following FCC approval since no employees of IBM, Comsat or Aetna can be on the staff of SBS," Comquest said.

"Basically the FCC requirement is that IBM should be involved only in the policymaking process for SBS through the Partnership Committee. But IBM must be separated from the operational aspects of SBS.

"There is obviously a grey area where policymaking ends and operating procedures begin. This is likely to be a continuous bone of contention with the FCC;" the report stated.

CI Notes

Aetna Subsidiary OKs Participation in SBS

McLEAN, Va. — A subsidiary of Aetna Casualty and Surety Co. has initiated its financial participation in Satellite Business Systems (SBS) in accordance with the SBS partnership agreement.

Under the partnership agreement, Aetna, since the inception of the SBS partnership in 1975, has been paticipating with Comsat General Corp. and IBM as an equal partner in the management of SBS.

Initial financial participation by Aetna and continuing financial participation by Comsat General and IBM, however, depended on their determination that the SBS Order issued by the Federal Communications Commission last Feb. 8 provides a satisfactory basis for proceeding with the venture.

That determination has now been made, according to SBS.

IBM Starts New Division

ARMONK, N.Y. — IBM has established a General Technology Division in its General Business Group.

The division, which will be responsible for semiconductor development and manufacturing, includes the Burlington, Vt., components plant and laboratory and the Manassas, Va., components laboratory.

The company also announced the Manassas laboratory will be relocated to Burlington. Both facilities were previously part of the System Products Division.

The Federal Systems Division, principal occupant of the Manassas site, is not affected by the transfer.

Xerox Makes Offer for Shugart

STAMFORD, Conn. — Xerox Corp. and Shugart Associates have signed a letter of intent leading toward acquisition of Shugart by Xerox.

The companies expect to reach final agreement within 60 days and complete the transaction by year-end. No details were revealed except that Shugart would continue under its present management and be operated as a Xerox subsidiary.

Shugart manufactures rotating memories, including flexible disk drives, a business Xerox is already in through the manufacture of cartridge disk drives by Diablo Systems, Inc.

Microcode in PCM Future

(Continued from Page 37)

both IBM and non-IBM operating systems with interchangeable boards, he noted.

However, there is another problem on the horizon for PCMs. As more and more software functions are integrated into hardware, PCMs are going to be put in an impossible position, Yerkes said.

"I don't see IBM losing any money over counterstrategies, going into programs that are going to cost it money," he said. "But as it develops new products, it will look for alternatives through new technology that don't cost any more money but do ace out the others."

The more IBM puts the decoding right in the devices themselves — such as disk drives — so that decoding is done not in the CPU but at the controller interface level, the less PCMs will be able to follow, he contended.

To what extent will the giant do this? Yerkes doesn't believe IBM will completely "ace out" the PCMs because, he said, if IBM obliterates the PCMs, the Justice Department will surely close it down or break it up.

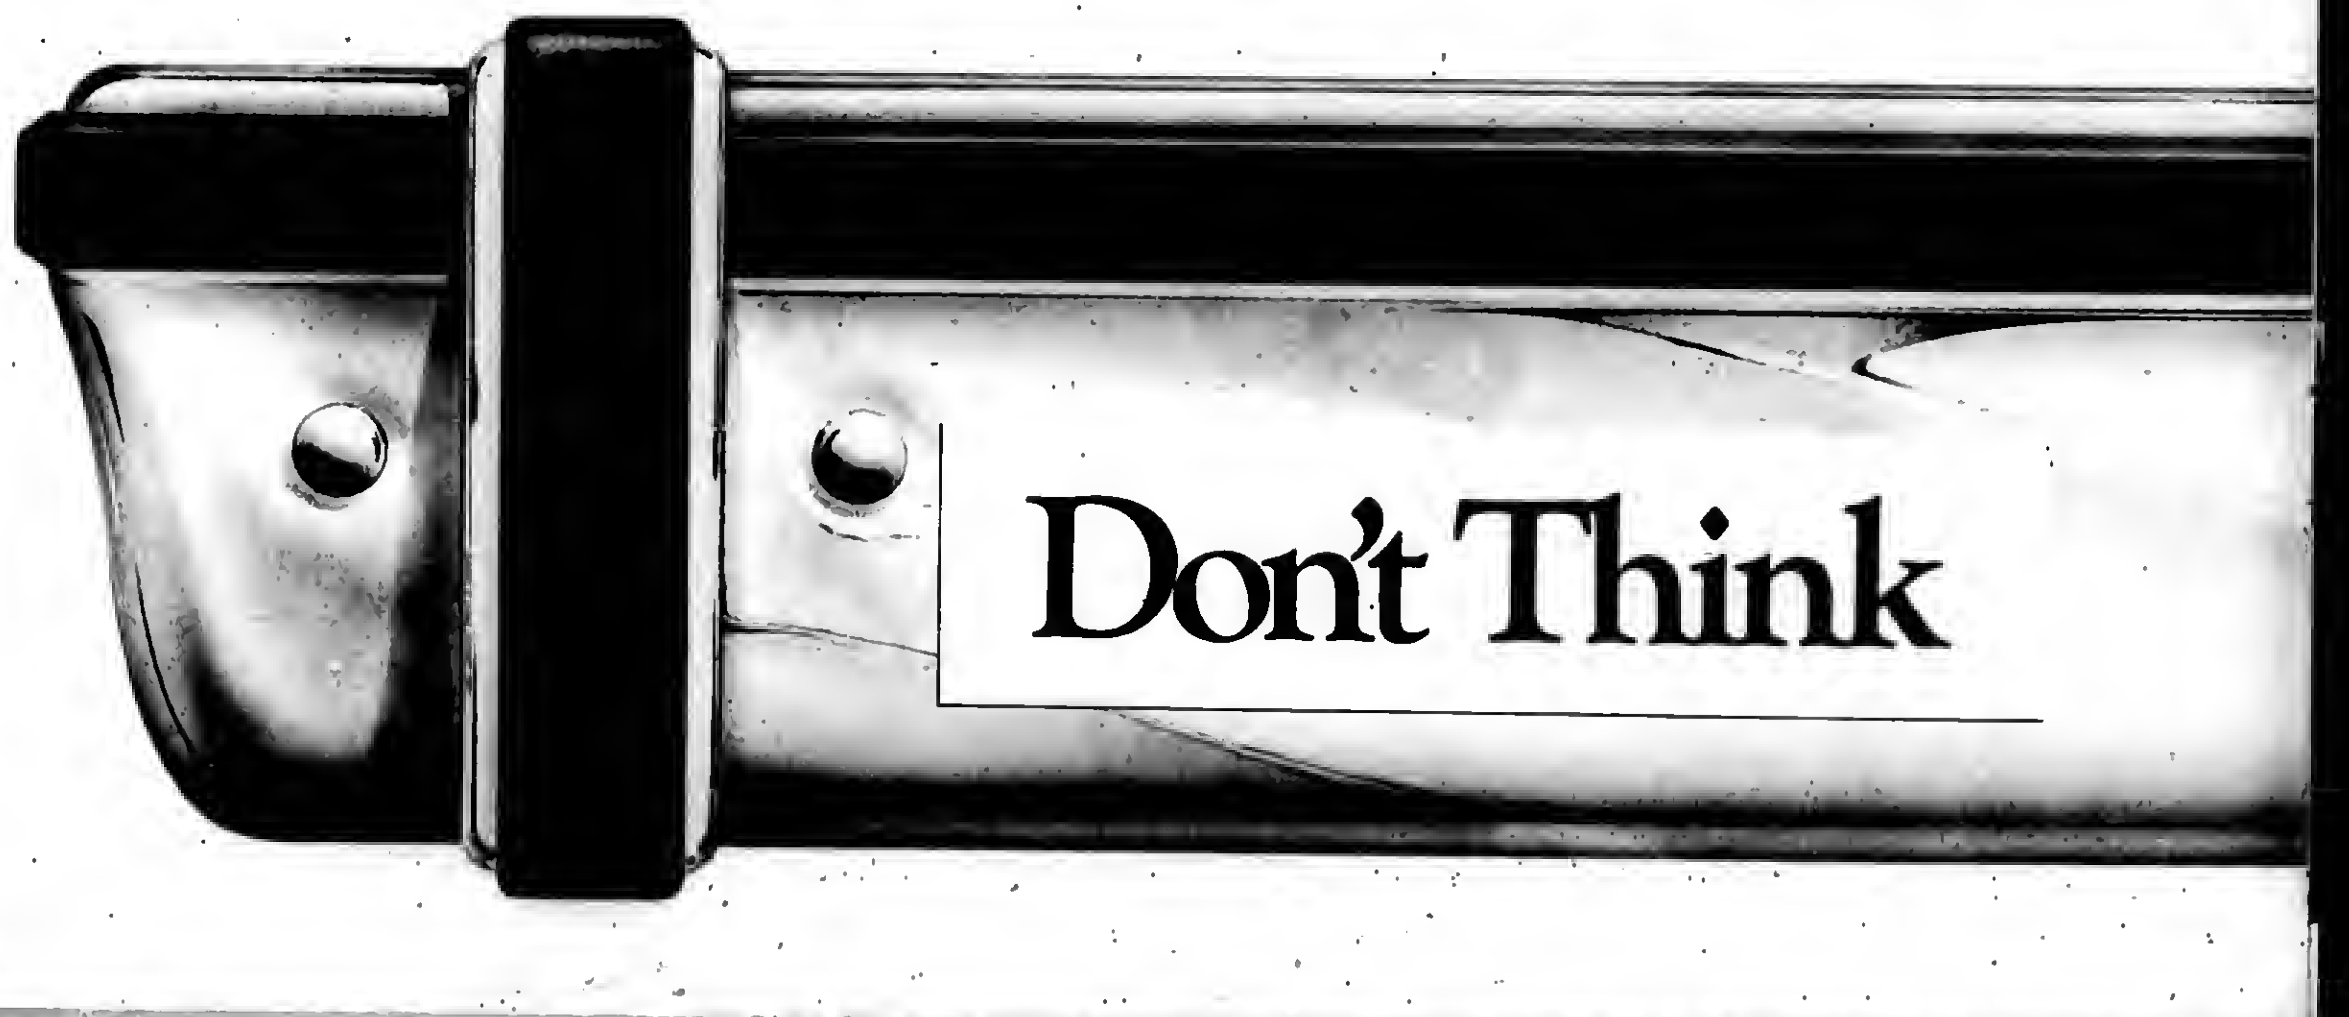
"I believe [IBM] will purposely leave enough margin in there for the PCMs just so its legal department can say, 'What do you mean we're a monopoly? Look at all those other people out there making money off our products.'

"IBM virtually needs the PCMs to make its case to the Justice Department," Yerkes said, adding he personally agrees with economist Alan McAdams, a U.S. vs. IBM trial witness, that IBM is a monopoly.

ADL's Withington noted that despite IBM's counterattacks on all types of PCMs in the past, "it's interesting they do still live. The better disk, tape and memory makers are still in business and they are making money.

"But they have been restrained by IBM to a position of perhaps tolerance.

"So if that's a guide, then the CPU makers may very well live. The question is, how much of IBM's market will they be allowed to take away?" Withington observed.



In Computer, Communications Industries

Capital Investment Funds Scarce, Congress Told

By Edith Holmes
CW Staff

WASHINGTON, D.C. – Money for capital investment has become as scarce a resource in the computer and communications industries as energy resources have become in the economy as a whole, Congress was told recently.

Speaking before the Joint Economic Committee's Subcommittee on Economic Growth and Stabilization, the Computer & Communications Industry Association (CCIA) warned the availability of capital will affect the way these industries continue to develop.

Captial requirements over the next five years for companies making small computers are estimated at $500 million and for companies making larger mainframes at over $1 billion, excluding the needs of IBM.

Further, the CCIA noted the microcomputer industry — spawned from earlier risk investments in the semiconductor industry — requires $400 million in outside capital for sustained growth between now and 1982.

CCIA President A.G.W. (Jack) Biddle was joined in the industry presentation of capital problems by Ryal R. Poppa, president and chief executive officer of Pertec Computer Corp., and Erwin Tomash, chairman of the board of Dataproducts Corp.

Together, these industry representatives called for Congress to establish a graduated corporate income tax, deductible expense treatment for dividends and a return to lower taxation of capital gains.

Poppa told the committee "the corporate tax rate of 48% hits the small and medium-sized corporate taxpayers and giant taxpayers alike." He argued the same principle of fairness and equity expressed in progressive personal tax rates should be carried over into corporate taxation.

Companies in their early growth years face heavy start-up costs and elusive profits, Poppa explained. "If smaller companies were taxed at a lower rate, retained earnings in the earlier years would be healthier and more stable, thus forming a more reliable source of internal financing to ensure their early growth periods."

Progressive Taxation

Poppa provided the subcommittee, which is chaired by Sen. Lloyd Bentsen (D-Texas), with a sample of a progressive tax rate schedule graduated according to a corporation's ability to pay. Under his proposed tax schedule, for example, a company with pretax income up to $50,000 would be taxed at a rate of 20%.

A company making between $350,000 and $400,000 would pay the government at a rate of 27%; the firm with an income of between $500,000 and $1 million would pay between 30% and 35%; and the corporation making over $500 million annually would be taxed at 70%.

Poppa also urged the retention of domestic international sales corporations (Disc) for small and medium-sized companies.

While noting Sen. Edward Kennedy's (D-Mass) condemnation of Discs as a "billion dollar annual giveaway to upper levels of the Fortune 500," Poppa argued smaller U.S. businesses need Discs to maintain their export operations.

Poppa suggested the subcommittee ensure against misuse of Discs by "limiting Discs to small and medium-sized corporations — those with capital accounts under $200 million — or by limiting the deferral permitted a given corporation in accordance with its capital account."

Tomash focused on the need to bolster the "faltering equity market. The Tax Reform Act of 1976, with its minimum tax and tax preferences provisions relative to captial gains, has all but eliminated reasonable after-tax rewards for the private investor," he said.

Rather than eliminate all special capital gains treatment, he urged President Carter act "to provide incentives for continued and new investment in our nation's industries."

Double Taxation

The elimination of double taxation of dividends would also provide some relief, Tomash said. However, "such tax reform would tend to benefit only the larger companies that are able to pay dividends.

"Certainly, if dividends were treated as a deductible expense, as is interest on borrowings, equity capital would be more competitive with debt equity," he continued.

But "we cannot trade capital gains reform for the elimination of double taxation of dividends," Tomash told the subcommittee. "The elimination of favorable treatment of capital gains would further isolate the small- and medium-sized companies from the capital market and, with dividend deductions available to larger companies, the capital drawing power of the large corporation over the financial markets would be assured."

System Coming

SAN ANTONIO, Texas – Datapoint Corp. is expected to introduce a small business floppy disk-system with a price tag of under $6,000 next month.

According to industry sources, the 32K system will include a microprocessor CPU, 32K of memory, a CRT and two diskette drives for a total storage capacity of 500K bytes.

The system is said to be compatible with the rest of the Datapoint family of systems and will run two jobs concurrently. It will be sold on a purchase-only basis.

Confabs Slated This Week

SigCPR to Meet

ARLINGTON, Va. – The 15th annual conference of the Association for Computing Machinery's (ACM) Special Interest Group on Computer Personnel Research (SigCPR) will be held here Aug. 18-19 at Stouffer's National Center Hotel.

Keynoting the national conference on team dynamics in systems development and management will be Gerald M. Weinberg, author of the *The Psychology of Computer Programming.*

Dr. Thomas W. Plum of Yourdon, Inc. will speak on innovative team concepts while Paul Oyer, president of the Federal Automatic Data Processing Users Group (Fadpub), will chair a panel on "Organizational Dynamics: How About Teams of Teams?"

Twenty-one papers will be presented in six sessions.

The registration fee for the conference is $75, with reduced fees of $60 for ACM or SigCPR members and $25 for full-time students.

Further information is available from the conference chairman, Fred Harold of the U.S. Civil Service Commission, Washington, D.C. 20415, at (202) 632-5650.

CCIA to Gather

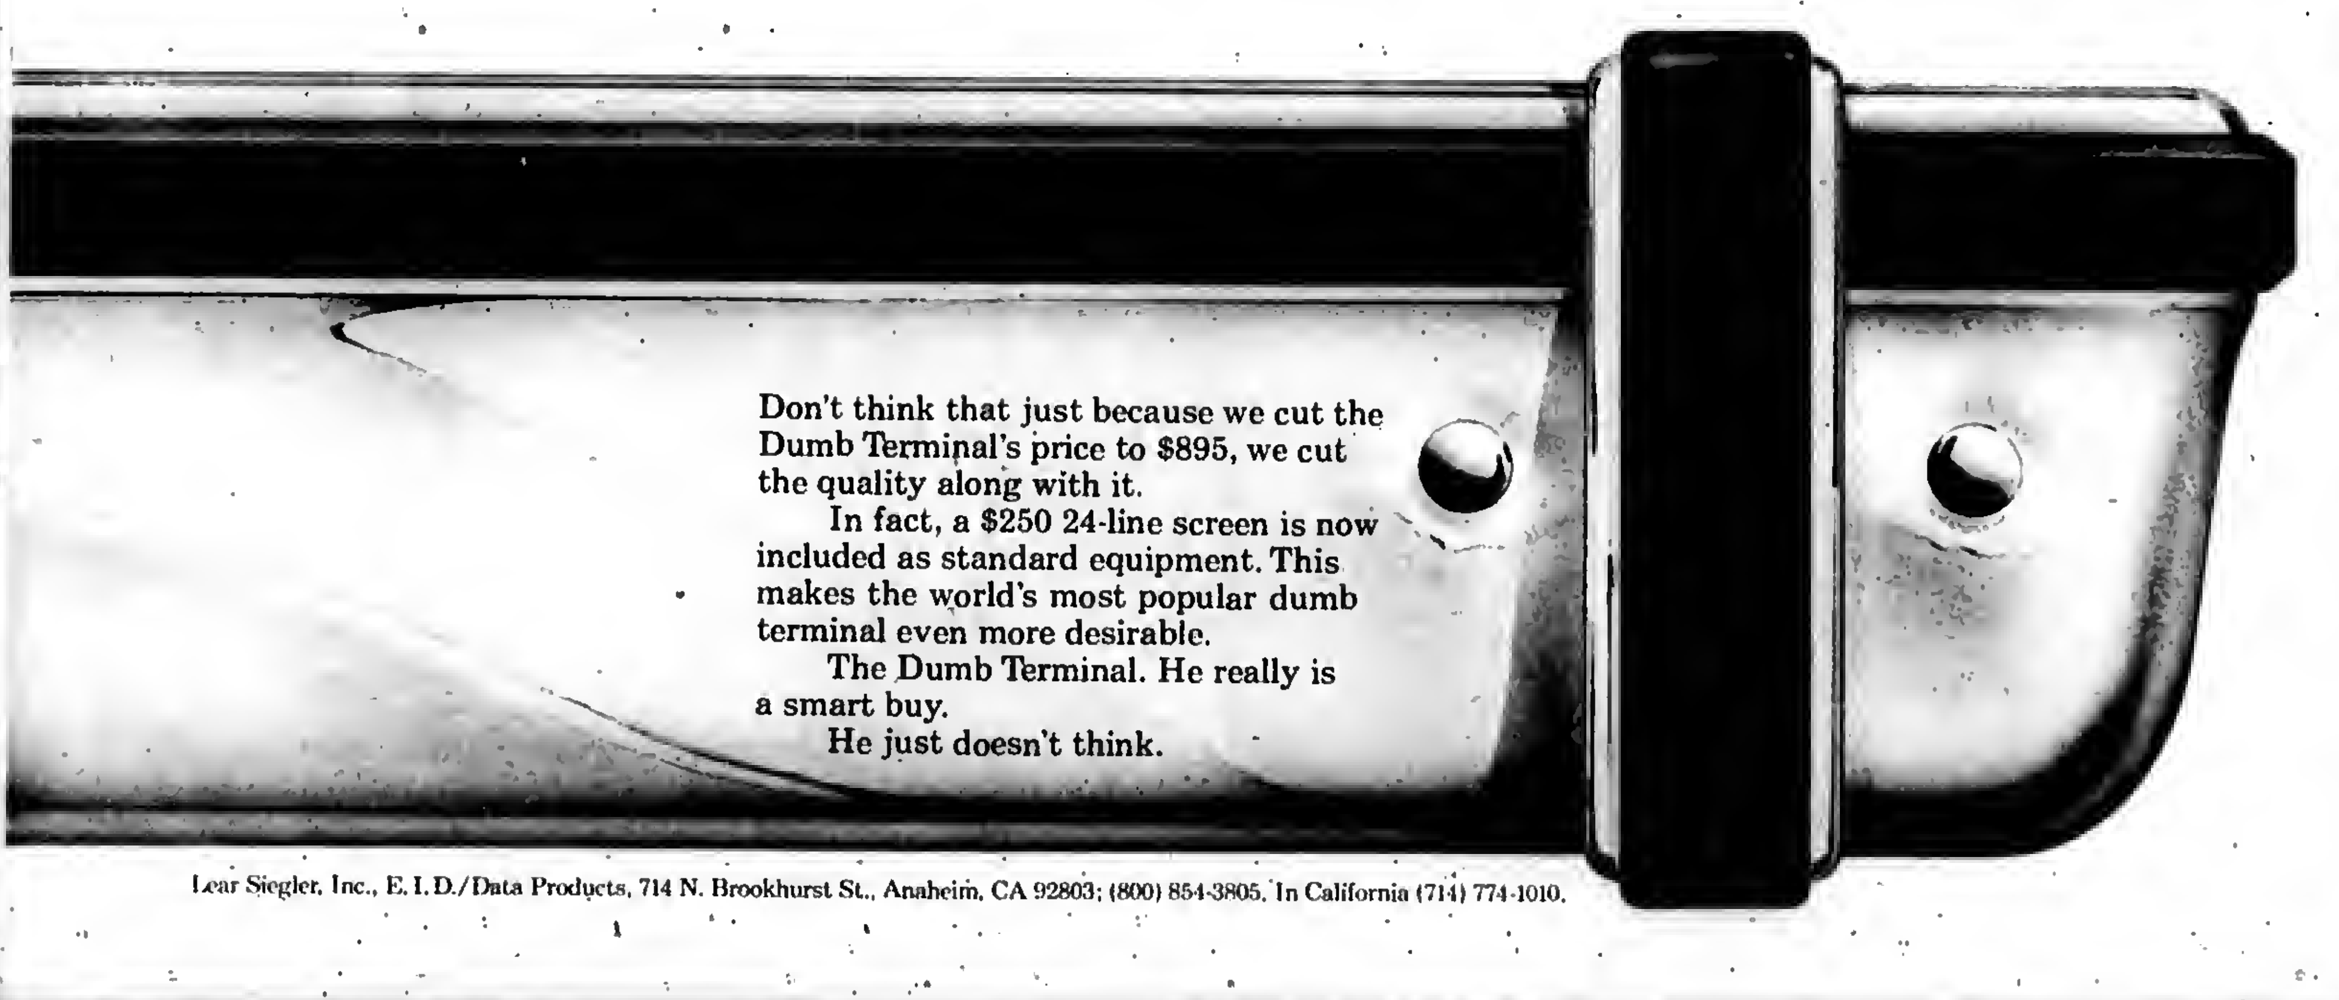
CHICAGO – Harry Newton, an independent telecommunications marketing consultant and writer, will be a guest speaker at the Computer & Communications Industry Association's (CCIA) fifth annual meeting Aug. 18-19 at the Hyatt Regency here.

Newton will deliver an address on "Success and Failure in the Telecommunications Industry: How to Achieve One and avoid the Other."

Also speaking at the meeting will be James Peacock of International Data Corp., who will discuss his "unpublished" insights into and analyses of the implications of recent IBM product announcements and pricing.

Finally, the CCIA meeting will include an overview by Dr. Les Gunderson, technical director of Corning Glassworks Telecommunications Products Division, on the potential of fiber optics technology.

These sessions are open to industry chief executives who are not CCIA members but wish to attend. The CCIA is located at Suite 512, 1500 Wilson Blvd., Arlington, Virginia, 22209.



Don't think that just because we cut the Dumb Terminal's price to $895, we cut the quality along with it.

In fact, a $250 24-line screen is now included as standard equipment. This makes the world's most popular dumb terminal even more desirable.

The Dumb Terminal. He really is a smart buy.

He just doesn't think.

Lear Siegler, Inc., E.I.D./Data Products, 714 N. Brookhurst St., Anaheim, CA 92803; (800) 854-3805. In California (714) 774-1010.

Sweda Expands Paper Tape Offerings

OEM Products

PINE BROOK, N.J. — Several paper tape devices have been unveiled by Sweda International. Additions to the Roytron line of desktop units include three models in the Series 1560 combination reader punch line; a Series 1060 punch-only unit and a Series 1250 reader-only unit.

Other introductions include a paper tape rewinder and a winder.

The Series 1560 punches 5- to 8-level tape at 60 char/sec and reads at 240 char./sec in synchronous mode.

The models 1560-AS and 1560-T have RS-232C-compatible interfaces. The 1560-AS was designed to operate with a terminal device on the same serial data lines while the Model 1560-T was designed to simulate a terminal device and uses a dedicated serial port.

The two versions of the Series 1060 punch-only unit, the 1060-AS and the 1060-P, have a RS-232C-compatible interface and a parallel TTL-level interface respectively.

The Model 1250-P can be slewed up to 240 char./sec. The 1250-AS generates data up to 2,400 bit/sec, the firm said.

The Model 92-C is a self-contained desktop paper tape rewinder; the Model 94 winder attaches to the punch housing.

OEM discounts apply to the products, Sweda said. Prices per single unit are: Model 1560-P, $1,695; Model 1560-AS, $2,250; Model 1560-T, $2,195; Model 1060-AS, $1,550; Model 1060-P, $1,295; Model 1250-P, $1,250; Model 1250-AS, $1,350; Model 92-C, $110; and the Model 94, $98.50.

Sweda International's OEM Products Division is at 34 Maple Ave., Pine Brook, N.J. 07058.

Drive Bows

MINNEAPOLIS — Control Data Corp.'s Model 9406 flexible disk drive handles double-sided, single- or double-density IBM-compatible diskettes and provides unformatted storage capacity of 1.6M bytes, the firm said.

The Model 9406 supports formats in either hard- or soft-sector operation.

CDC has also introduced the Model 9474 drive subsystem which accommodates up to four drives in a configuration with up to 6.4M bytes of unformatted capacity.

The 9406 operates with data formatting and timings resident in the host controller, CDC said.

Access time for both single- and double-density versions of the disk is 6 msec track-to-track; the recording density is 48 track/in., the firm said.

The Model 9474 uses the Intel 8080 to control drive operations.

Single units of the two-sided CDC 9406 cost $775, about 25% higher than the single-sided CDC 9404.

A Model 9474 subsystem with controller ranges in price from $2,600 for a single-drive configuration to $5,200 for four drives. Quantity discounts are available.

Tandon Adds Ferrite Head

CHATSWORTH, Calif.— An IBM-compatible double-sized ferrite recording head for floppy disk drives has been developed by Tandon Magnetics Corp.

The Series 200 is compatible with the IBM-type swing arm assembly which facilitates loading and unloading of diskettes, the firm said.

The heads meet the requirements of double-density recording, feature tunnel erase and have the same electrical characteristics as industry-standard, single-sided heads, a spokesman added.

Tandon will supply the double-sided heads unmounted or mounted and aligned in an OEM's carriage. The design allows loading of the two read/write heads simultaneously on both sides of the disk.

The heads cost under $50 in OEM quantities from Tandon at 20731 Prairie St., Chatsworth, Calif. 91311.

Tandon Series 200

Gulton Printheads Handle Mixed Data

METUCHEN, N.J. — Gulton Industries, Inc.'s DM1099 and DM10101 thick-film dot-matrix thermal printheads permit simultaneous printing of analog, graphic and alphanumeric data, according to the firm.

Each printhead contains a single continuous row of printing elements on a pitch of 50 point/in. Each dot is composed of two halves printing parallel.

The DM10101 contains a total of 101 dot elements where the 101st dot is for applications requiring both a zero and 100th data point. The DM1099 contains 99 dot elements to be used in conjunction with the DM10101 for data expansion.

Units are priced at $121.20 in single quantities through $75.75 in the 100- to 499-unit range from Gulton's Hybrid Microcircuit Department, 212 Durham Ave., Metuchen, N.J. 08840.

94% DISCOUNT
IN QUANTITIES OF ONE

Why spend $150,000 or more for a firmware system when our's can give you the same End results for less than $300/mo. (60/mo lease plan). Remember us! We're that "FREE SOFTWARE" company that provides you with thousands of dollars of software for just a little more than the cost of the paper its' printed on. NOW we are going to virtually give away our "Firmware System" at mere fractions of everyone else's prices. How can we do it? Well — Just like we did with our software; by providing a quality product at very nominal prices and relying on volume for our profit instead of making it off you! Unlike some of the other advertised systems we offer a TOTAL system package with mass memory, video display, line printer; operating system, plus a full Application Software Library. Software packages available with the system include; Payroll, Inventory, General Ledger, Medical Record Keeping, Word Processing and more. Entire package includes everything above plus system tutorial, more than 600K Bytes of formatted disk storage and over 65K Bytes of RAM. Assembled and ready to use. Complete Unit price $8999 plus shipping. Leasing plans and national service available from any of our 134 dealers.

POSITION ANNOUNCEMENTS

OMICRON

Consultants to the Computer Industry

SYSTEMS SOFTWARE PROFESSIONALS

San Francisco Bay Area

OMICRON, a prime SAN FRANCISCO BAY AREA Data Processing recruitment organization, is currently engaged in the search for several Systems Software Professionals such as:

SYSTEMS MANAGER

Responsible for the installation, operation & systems software for the computer facility & associated teleprocessing networks. Requires BS degree and 4 years experience as a Sr. Systems Programmer plus knowledge of IBM software (OS/VS, VM, SVS or MVS) and BTAM/EP or VTAM/NCP. Salary to $26K.

PERFORMANCE MEASUREMENT SYSTEMS PROGRAMMER

Must know IBM 370/OS internals, ALC, performance measurement tools (PPE, CUE, etc.) and SMF. Capable of interfacing with application programmers & writing operators aids. Installation going to MVS in the fall. Salary to $25K.

SYSTEMS PROGRAMMERS
Far East

2 year assignment in the Far East requiring large scale operating systems background (MVS, VS2, SVS), BTAM, HASP, systems utility & languages (COBOL, FORTRAN, PL1, etc.). Capable of performing sysgens, tuning, and PTF's. Vendor experience preferred. Company paid transportation & cost of living adjustments. Salaries to $34K.

For outstanding career opportunities, please call or write, in confidence, to:

OMICRON, Inc.
Exclusively Employer Retained Agency
415/546-7200
ONE ECKER STREET
(Ecker & Stevenson Streets)
SAN FRANCISCO, CA 94105

SYSTEMS ANALYSTS

SPERRY UNIVAC'S National Accounts Operation has immediate career openings for talented Systems Analysts with experience in any of these areas:

- 1100 Series
  EXEC
  TIP/CMS
  DMS
  CTS
- 3760 Communications
- Series 90
  OS 3
  VS 9
- Series 70

You will be joining a growth-oriented marketing organization staffed with highly competent data processing professionals like yourself.

We offer competitive salaries, expenses, and an excellent benefits package. For prompt consideration, rush your resume to:

John Drinkard
SPERRY UNIVAC
P.O. Box 500, Blue Bell, PA 19422
An Equal Opportunity Employer m/f

SPERRY UNIVAC

Senior Systems Analyst

Knowledge of Basic, COBOL multiple languages is an asset.

Digital Equipment Corporation, the world's minicomputer leader, is looking for a systems analyst with at least 5 years programmer/analyst experience for its rapidly growing manufacturing plant in Salem, N.H.

You'll be responsible for defining systems needs for the business, examining existing software's capability of handling the dynamic growth. Applications you'll deal with include order administration, production, scheduling, material control, and material planning.

Excellent potential for a management career, plus lots of upward mobility. For consideration, please send your resume outlining salary history to: Jane Shea, Digital Equipment Corporation, Dept. JS815, 288 North Broadway, Salem, New Hampshire 03079. We are an equal opportunity employer, m/f.

We're the company looking for people.

digital
digital equipment corporation

Computer System & Software Engineers

You can get ahead faster with us than with anybody else.

Here's why:

1 You are needed right now. Our project teams are crying for good professionals who can grab hold fast.

2 You'll get a chance to prove how good you are. Everybody is evaluated regularly, there are no missing persons at TI. If you're good, you move up fast. No matter how long the people above you have been there.

3 You'll be involved in state-of-the-art projects. Air Traffic Control. Satellite navigation systems. Landing systems. Radar and infra-red sensor systems. Computer-aided design, manufacturing and electrical test systems, machine tool control, text processing and process control. Acoustic data and image processing. In addition, an Advanced Software Technology Department has been formed to develop state-of-the-art tools, procedures, and languages for computer system design and software production. TI is the technological leader in literally scores of product fields. This leadership has produced more than 5,000 patents

4 You'll work on a complete system. No threat of getting locked into a repetitious specialty. You'll work on a small project team. You'll interface daily with other disciplines and other phases of your overall program

5 You'll work in a job-stable, multi-market situation. We have a variety of products and markets. We're not heavily dependent on any one of them – and neither is your job

Entry Level or Experienced Openings for U.S. Citizens

Software System Designer
M.S. in Computer Science or Engineering and experience in design of software systems for real-time and interactive systems.

Computer System Engineer
M.S. or PhD in Electrical Engineering or Computer Science and five years experience in hardware and software design of real-time computer systems.

Engineering System Analyst
M.S. or PhD in Math, Physics, Computer Science, or Engineering, and experience in analysis of engineering systems.

Programmers
B.S. in Computer Science, Math, Physics, or Engineering and programming experience with higher order languages such as Fortran, Pascal or PL/I. Both scientific and real-time programmers are required.

Language Processor Designers
M.S. or PhD in Computer Science and three years experience in development of programming languages, compilers, translators, assemblers and link editors

Send your resume in confidence to
Staffing Manager/P.O. Box 6015, M.S. 222/Dallas, Texas 75222.

An equal opportunity employer M/F.

Large-Scale Opportunities in Advanced-Technology EDP Systems Development

SENIOR SOFTWARE SPECIALISTS

Several positions are currently available consisting of the development of a very large distributive processing system and will include advanced state-of-the-art technology. Will utilize the entire spectrum of EDP equipment from mini's to large mainframe and a large assortment of associated peripherals and other devices, i.e. terminals, etc. Minimum of 5 years' experience in the development of systems software with the preponderance of this experience in telecommunications, networks and file processing, plus a background in operating systems, plus expertise in COBOL and assembly languages necessary with strong preference for a related degree.

DISTRIBUTIVE PROCESSING SYSTEM DEVELOPMENT

Positions are available in the development of a very large distributive processing system, advancing the state-of-the-art technology utilizing the spectrum of EDP equipment – minis to large mainframe with assorted peripherals and terminal devices. Experience in telecommunications, networks, file processing or operating systems plus expertise in COBOL.

If you are interested in being considered for one of several new positions with us, please send your resume and salary history/requirements to Thom Harris.

NCR

Special Systems Division

WASHINGTON, D.C. 20052

Manager Systems Performance Evaluation

Our Information Processing Center, which is responsible for all of Digital's internal EDP, is seeking a dynamic, performance-oriented "doer" to assume responsibility for its systems performance, evaluation. Because this position involves dealing with all levels of management, it is an outstanding opportunity to demonstrate your abilities in a high-visibility situation.

Based at our corporate data center in Maynard, Massachusetts, you'll supervise a small group of highly competent senior technical people and work with some of the best tools in the industry – DECsystem 10, PDP-11, and DECSYSTEM 20.

The ideal candidate may currently be with a consulting firm or a large company, and will have a Master's degree or equivalent in Computer Science or a related field. 3 years experience in performance evaluation, 2 years supervisory experience, effective interpersonal skills, plus the ability to evaluate situations and make decisions are also required. Production center data experience is a plus.

If you are interested in the challenges and rewards of this highly responsible position within Digital, please forward your resume including salary history, in confidence, to Rosemary Mallen, Digital Equipment Corporation, Dept. H87, 162 Main Street, Maynard, Mass. 01754.

We're the company looking for people.

Data Processing Opportunities

San Francisco Peninsula

Siliconix, a growing company in the semiconductor industry for 15 years, continues to excel in profit and reliability, and that means exciting and STABLE career opportunities for qualified professionals in our Information Services Group. Join us now if you qualify:

SYSTEMS ANALYST

Excellent position for an Information Systems Analyst to work with management defining systems objectives, establishing detailed requirements, preparing user documentation and training users in systems operations. BS in Business or Math with 4-6 years' work related experience.

PROGRAMMER

The successful candidate will participate in the development of on-line manufacturing information systems. You will be working in an IBM/370 environment. 1-3 years' experience will qualify you.

If you're ready for pleasant year 'round weather, easy access to fine schools, theatre and water activities, then join us now. You can expect a good salary and liberal benefits including dental insurance, profit sharing, tuition assistance, relocation assistance, and a stock purchase plan. For immediate consideration, please send your resume to Professional Employment, 2201 Laurelwood Road, Santa Clara, CA 95054, or call COLLECT (408) 246-8000, Ext. 233. An affirmative action employer.

Siliconix

Grow with Amdahl and be a part of the future.

Software Opportunities

Are you good at diagnosing system level problems? Amdahl needs…

FIELD SUPPORT REPRESENTATIVES

You should be able to work on your own in the resolution of complex system level problems encountered by Amdahl users. You should have good MVS internals experience plus expertise in one or more of the following components or subsystems:

- VTAM/NCP
- JES3
- IMS
- VSAM
- TCAM/TSO
- CICS

Current openings are in the San Francisco Bay Area.

Can you accept the challenge of creating an error free system? How: by building test cases that really put all operating system components through a real test. If so, Amdahl needs you as a…

SOFTWARE QUALITY CONTROL SPECIALIST

to generate, apply and verify VS1, SVS, VM or MVS software and material distributed to our Amdahl customers. You should have a close working knowledge of the VS1, SVS, VM or MVS operating system internals, utilities, SMP and assembler language. Current openings are in the San Francisco Bay Area.

Can you build a better mousetrap? Amdahl needs…

SOFTWARE SYSTEMS MAINTENANCE SPECIALISTS

to create all Amdahl SCP maintenance materials. You should possess a detailed knowledge of the VS1, MVS, VM or SVS operating system internals as well as a good working knowledge of utilities, SMP and assembler language. Current openings are in the San Francisco Bay Area.

Do you enjoy customer contact? Amdahl needs…

FIELD SYSTEMS ENGINEERS

at customer locations. You need the ability to handle problems encountered on a daily basis in a large commercial data processing environment. You should have good diagnostic expertise in VS1, SVS, VM or MVS and the ability to be a jack-of-all-trades. Currently there are several openings throughout the United States.

Do you enjoy traveling? Amdahl needs…

HEADQUARTERS SYSTEM ENGINEERS

to work with Field Systems Engineers at customer locations solving difficult problems. You will also assist customers and Field Systems Engineers in the complex area of system performance and tuning. You should have very good diagnostic techniques and MVS, VS1, VM or SVS internals experience. Current openings are in the San Francisco Bay Area.

Have you been active in recent MVS conversions? Amdahl needs…

MVS CONVERSION SPECIALISTS

to work closely with Field Systems Engineers and Amdahl customers converting to MVS. You should have several years' MVS internals and externals experience, as well as either JES2 or JES3 expertise. Opportunities available for extended travel. Current openings are in the San Francisco Bay Area.

Do you enjoy teaching? Amdahl needs…

SYSTEMS ENGINEERING INSTRUCTORS

to teach MVS or JES3 classes for our Field Systems Engineers. You should have current experience teaching MVS or JES3 internals. Current openings are in the San Francisco Bay Area.

ASP/JES3

Amdahl is looking for people with detailed knowledge of ASP or JES3. Opportunities exist in many functional areas of system programming. Current openings are in the San Francisco Bay Area and throughout the United States.

Send your resume to Phil Beekhelm, Amdahl Corporation, Department A01, 1250 East Arques Avenue, Sunnyvale, CA 94086, or call Michele Edson collect at 408/735-4500 between 9:00 AM. and 4:00 PM. We are, of course, an equal opportunity employer.

16575 W. Bernardo Drive, San Diego, Calif. 92127
An Equal Opportunity Employer

COMPUTER PROFESSIONALS MVS JES-3 CICS

Our continued strong commitment to the development and installation of sophisticated financial applications and software techniques creates a number of positions which are available in our Information services department. We are searching for those computer professionals who desire to join a team which will remain leaders in our industry

PROJECT MANAGERS

Individuals will be responsible for the overall direction of the various disciplines required in the design and implementation of financial and business systems. Involvement with design of EDP systems and project management of at least 5 years is required. Formal training in computer science an advantage and may be substituted for some of the experience requirements.

SENIOR PROGRAMMER ANALYSTS

ANS COBOL experience of at least three to five years in a business or financial environment is essential. We desire familiarity with: DBMS, DB/DC, CICS, ALC or file access methods. Experience with hierarchial design will be helpful. Will be assigned to complex projects of design and implementation. Excellent communication skills necessary because of heavy user contact.

PROGRAMMER ANALYSTS

Requires fluency in COBOL and background including IBM 370 using MVS and OS/JCL. These Individuals must have a system background of at least two to three years. Also must be capable of involved and complex system and program design. Excellent communications skills important. On-line program development experience a plus.

These are positions which will require individuals who are willing to accept unusual challenge and responsibility. We offer involvement in one of the most progressive sites in the industry Compensation will be commensurate with background. We offer competitive benefits and a very desirable Western New York location. Please send resume including salary history and requirements to: Robert J. Woeppel, Manager - Employment, Marine Midland Bank, One Marine Midland Center, Buffalo, New York 14240.

MARINE MIDLAND BANK
An Equal Opportunity Employer M/F

FIELD SERVICE ENGINEER

Growing Hospital Systems Co. needs engineer for onsite maintenance of large Eclipse-based on-line hospital system in Washington, D.C. Must have at least 2 years experience on Data General computers, including Eclipse C-300, 4231 drives, and 4257 multiplexors. Informal working environment. Salary competitive based on experience. Send resume including salary, history to: CW Box 5133, 797 Washington St., Newton, Mass. 02160.

SYSTEMS MANAGER

Salary area
$45,000

Our client, one of the nation's leading retailers is converting to point of sale systems throughout its thirty-four state chain. Relocation to dynamic Houston, Texas is just one of the benefits to taking over this top P.O.S. post.

INTERCOMM Application Programmer Analysts

Interested in travel? We have what you want!

Imformatics PMI is now staffing for INTERCOMM accounts on a national level. Applicants include material control, manufacturing, construction and utilities. We offer qualified applicants a full-time permanent position at competitive salary, significant job responsibility, superior benefit package including travel incentive and a genuine professional environment in which to grow. If you have at least 1 year of INTERCOMM experience using 3270's and 2 years of COBOL, please submit your resume with current salary to: Informatics PMI, 1121 San Antonio Rd., Palo Alto, Calif. 94303.

informatics inc

Member SIA Software Industry Association

Dean of Administrative Services, for Northeastern University.

Reporting to the Vice President for Administration, the Dean will provide overall leadership in the planning, use and management of EDP resources, including future systems development planning. In addition, the Dean will evaluate costs and benefits of enhancing existing information systems, and of implementing a data base approach to computer systems. Initial areas of responsibility will include Academic and Administrative Computer Centers and the Office of the Registrar. The University is consolidating all EDP resources to provide data processing support to all operations, including Finance.

The position requires a thorough knowledge of state-of-the-art hardware and software, as well as experience in major software conversions; a background in planning and coordinating information systems would be valuable. Candidates should also have familiarity with application programming and systems design, with strong management skills and administrative experience in managing a major academic and/or administrative computation center. A Master's degree is preferred.

Salary is negotiable; It, and the benefits package that go with it, will be attractive.

Please write, including a resume and salary history to John A. Curry, Vice President for Administration, 175 Richards Hall, before August 15, 1977.

Northeastern University
360 Huntington Avenue
Boston, MA 02115

Advanced Software Design

Talk With Us About The Career Challenges In Telecommunications

CALL TOLL FREE

(800) 323-1966

In Illinois (800) 942-0491

Today thru Friday, August 7 — August 12 from 8 am to 5 pm cst

Telecommunications is one of the most rapidly growing segments of the software frontier. We have major projects underway now . . . forerunners of our long-term commitment to significantly advancing the state-of-the-art. We're working from definition and design through development and implementation in areas such as CAD, Data Base Systems, Simulation, Fault Recovery, Diagnostics and many areas of software design in an on-line, real-time environment.

Software Design

We're looking for an indepth background in the development of systems software and a minimum of 3 years' experience in structured design, testing and documentation of programs running on large data base, multi-file systems in real-time. Familiarity with HIPO design documentation, TSO usage and software simulation techniques as well as PL1, Fortran and assembler languages for the 8080 and PDP 11 programming is also important.

Data Base Design

This position requires a minimum of 5 years' experience in the planning development, design and implementation of data base software, including data base management systems administration. Your primary responsibilities will be the development of data base system for a large on-going project including the implementation, support and adminstration of systems.

Computer Aided Design

We are looking for an extensive background in the design of CAD/CAM systems and the development of Interactive access by the users of CAD/CAM functions. Required is 5-10 years' experience in both hardware and software aspects; DA systems operations, and design, and systems engineering. Your initial responsibilities will include evaluation of existing systems, and working with a project team in the Architectural Planning of a major new system.

Mini-Computer Programmers

We have specific assignments available on project development teams responsible for the design implementation of various telecommunication processing systems utilizing mini-computers as the processing element. Responsibilities will include the development of software programs for real-time operating systems as well as unique hardware elements incorporated into the systems.

If you have in-depth expertise in one or more of these areas, a BS, MS or PhD in Electrical Engineering, Computer Science, Math or other appropriate engineering discipline and have an interest in moving forward with one of the challenging new frontiers in computer technology, talk with us.

If unable to call, please send your resume to:

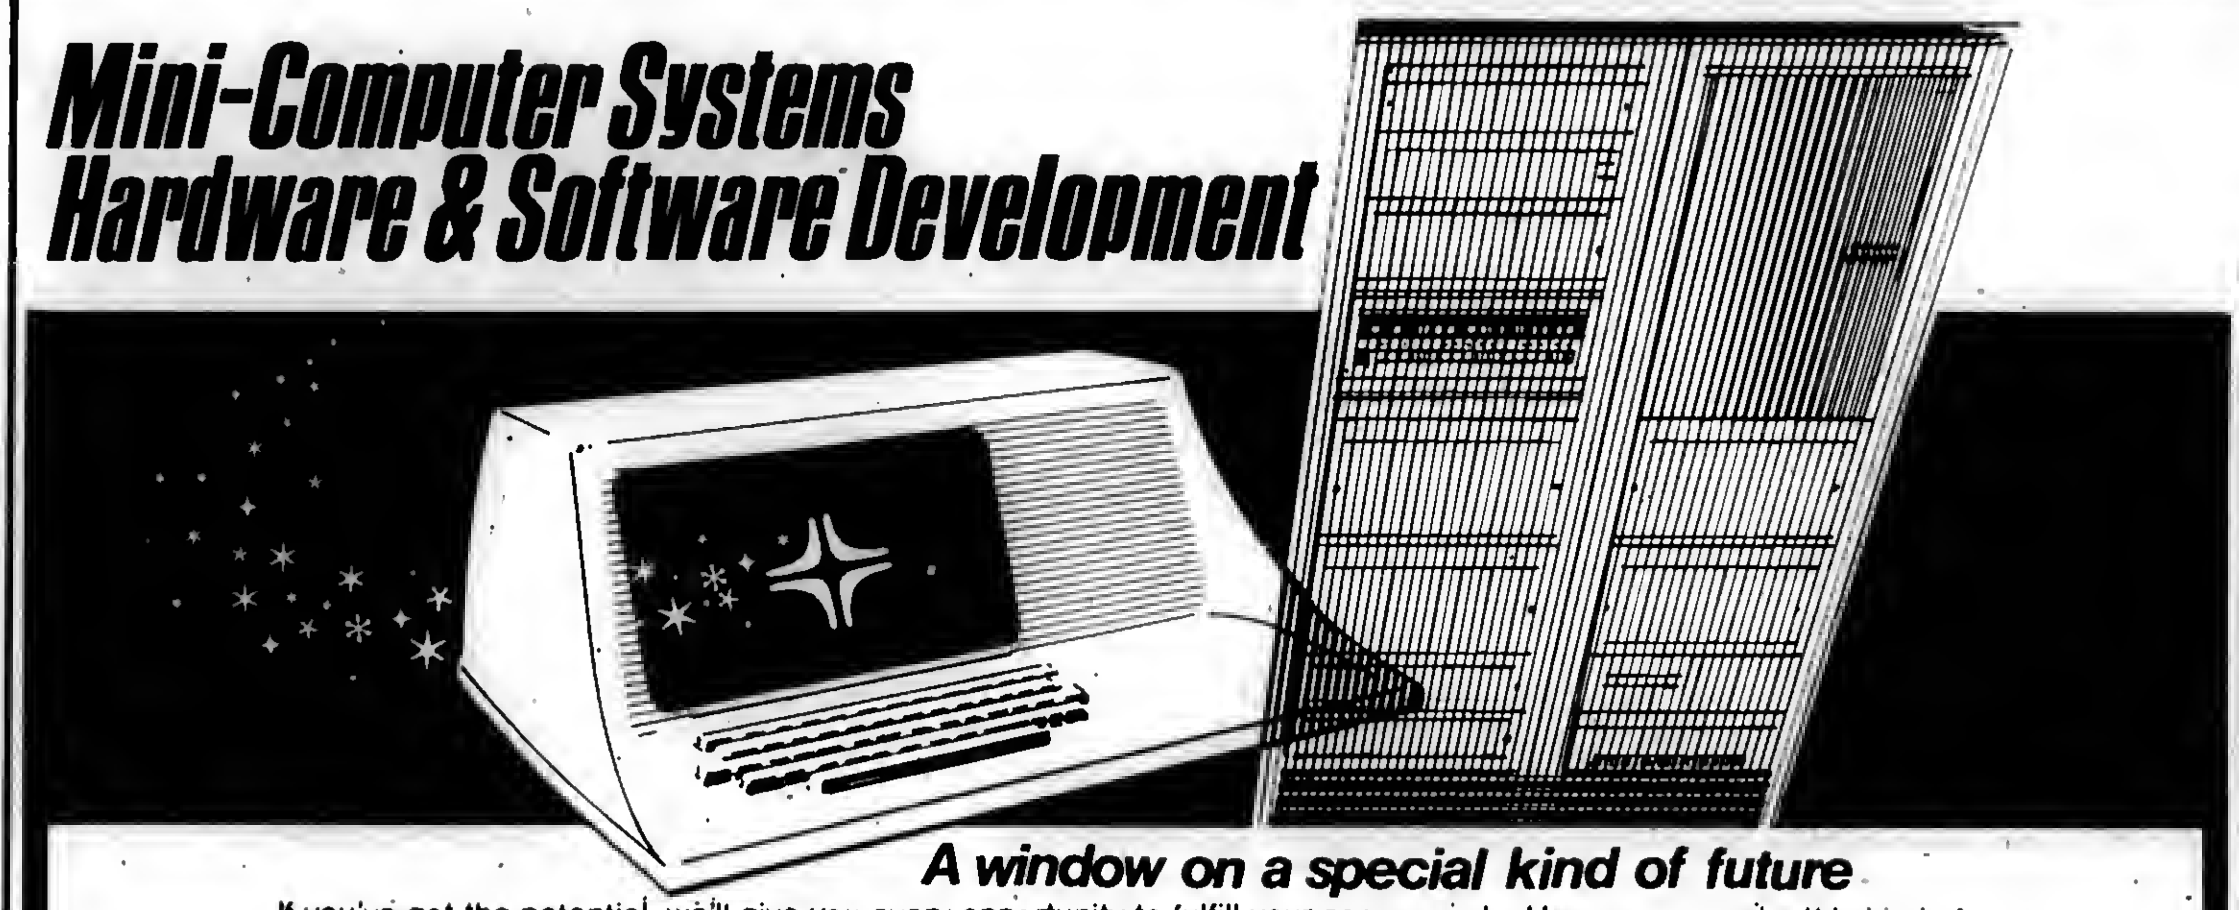
HUGHES

HUGHES AIRCRAFT COMPANY

Mini-Computer Systems Hardware & Software Development



A window on a special kind of future

If you've got the potential, we'll give you every opportunity to fulfill your career goals. How can we make this kind of promise? Easily! We intend to double in size within the next year, and this kind of expansion means ground floor opportunities. We have a virtual abundance of openings for top talent in the following areas:

DEVELOPMENT ENGINEERING

Computer Development Engineers

Responsibilities will include the digital design and checkout of high performance mini-computers and I/O processors. Positions require a BS or MSEE and a minimum of 2 years experience in microprogrammed CPU design utilizing high speed TTL logic. Specific experience in memory management and channel design is necessary; a good working knowledge of computer architecture is preferred.

Controller Development Engineers

Individuals will be responsible for the design, implementation, test and release of high performance, low cost microprogrammed controllers. In addition to a BS/MSEE, experience must include 2-4 years of computer and digital systems design utilizing high speed TTL logic to develop any or all of the following: Arithmetic unit design, memory management unit design and data communications (bit-oriented protocols).

Circuit Design Engineers

An immediate need exists for Senior Circuit Design Engineers with the experience and ability to resolve significant analog problems. Must have the experience in designing switching power supplies, high speed BUS, A to D, D to A, converters and modems. Significant experience in worst-case design techniques, computer-aided design, stability analysis and a BS/MSEE degree is a must. Demonstrated ability to supervise other engineers and technicians is desirable.

Sustaining Engineers

Positions are responsible for sustaining standard hardware products by generating cost improvements and performance enhancements. A BSEE along with a minimum of 2 years experience in sustaining or product design is required, including computer and system design, competence in complex circuit-system design utilizing worst-case design techniques, computer-aided design analysis, and software test equipment troubleshooting techniques.

SOFTWARE DEVELOPMENT

Transaction Teleprocessing

BS Computer Science or related degree and a minimum 3 years experience in any of the following: On-line teleprocessing systems, Data Base management systems recovery, performance analysis/measurement and/or Data Communications, i.e. bit-oriented communications link protocol (SDLC, UDLC, HDLC). Individuals will have responsibility for any number of development projects.

Language Design

Openings exist in Data Base and compiler (COBOL) development. Minimum BS Computer Science or equivalent and 4 years experience in (1) the development of Data Base management systems and/or the design of INQUIRY/UPDATE/REPORT systems to a data base and high level language, or (2) the design and development of language processors, especially COBOL.

Operating Systems

BS/MS Computer Science and a minimum 5 years experience in the design and development of data communications, software for operating systems. Specific experience must include ASYNC-BISYNC line and network protocols, (SDLC, UDLC, HDLC). Individuals must have the ability to conceptualize to the extent of pushing the "state-of-the-art".

Diagnostics

We need professionals with a minimum 5 years experience in assembly language programming, preferably with mini-computers. Individuals will have project responsibility for the development of systems level testing and fault isolation software.

Software Enhancement

Positions require BS Computer Science or equivalent and a minimum of 2 years experience on mini-computers with primary emphasis in coding of operating transaction systems and/or the identification, resolution and implementation of enhancements to all systems software. Strong background in assembly language programming necessary.

SYSTEMS PROGRAMMING

Applications Development

6-12 years experience in the following areas is required: Evaluation of customer RFQ/RFP packages, proposal preparation for custom software systems, preparation of estimates for the development of custom software packages, design and implementation of applications software packages. Technical expertise is required in communications, distributive processing, data base design, commercial real-time systems, and software development for mini-computers. Language experience should include assembly language on a mini-computer as well as at least one high level language (FORTRAN/COBOL).

Data Communications Applications

2-6 years experience in communications with commercial transaction-oriented systems using on-line teleprocessing monitor controlling IBM 3270 or compatible equipment. Mini-computer assembly language programming is required. Individuals will work on the development of a special purpose teleprocessing monitor.

Message Switch

Challenging positions are available for Senior Programmers with 1-3 years experience with assembly language on mini-computers. Job responsibilities are to learn and maintain our message switch product. Experience in communications/message switching is a plus.

Specials Diagnostics

We are seeking individuals with 3 or more years of experience in assembly and higher level programming languages (FORTRAN/COBOL). Knowledge of real-time systems programming is required, with experience in data communications and/or diagnostics being highly desirable.

MANAGEMENT SYSTEMS

Business Systems Analysts

Immediate openings exist for individuals with a minimum of 3 years experience in programming and systems analysis for business systems applications. Previous experience is desired in a wide variety of on-line, data-base applications in marketing, manufacturing and finance. Thorough knowledge of COBOL is required, and familiarity with mini-computers is desirable.

MARKETING SUPPORT

Software Application Analysts

Our Headquarters Marketing Support Organization which is involved in customer interface with pre and post sales support, seeks both Junior and Senior level individuals with an appropriate college degree or minimum of 3 years experience as a Systems Programmer or Field Analyst with expertise in the following: Operating Systems, Telecommunications, Data Base Systems design and high level languages. Previous experience involving customer and sales engineering interface desirable.

Please send your resume in confidence to Art Ruben.

MAKE THE RIGHT MOVE

You're time is now. You've paid your dues and you're ready for the next step. You can be sure that step is in the right direction with Teledyne Brown Engineering. A well established company in Huntsville, Alabama, Teledyne Brown has several openings for experienced data processing professionals.

PROGRAMMERS

You'll be developing simulation, data reduction, and test control software on large mainframes and minicomputers. A B.S. in Computer Science, Physics, or Engineering and at least five years of programing experience including work in assembly language are prerequisites for success.

TEST PLANNERS AND DATA ANALYSTS

As testors, you'll plan software tests and analyze resulting test data. A B.S. in Computer Science, Physics, or Engineering and a minimum of three years experience in testing large real-time software packages are musts.

SYSTEMS ANALYSTS

You'll be analyzing hardware architecture and systems performance, writing high level requirement specifications, and projecting future technology requirements. A minimum of three years in designing processing algorithms and developing or analyzing processor system requirements and technology trends are critical. BS Computer Science, Physics, or Engineering required.

SYSTEMS SOFTWARE DESIGNERS

This is your chance to enter the stimulating world of computer graphics. Your work will include writing specs, designing, and developing interactive graphics on a mini. You'll also develop a high level simulation language compiler. A BS in Computer Science or Engineering and three years in systems software should back up your creative instincts.

DP METHODOLOGY DESIGNERS

If you have a knack for software efficiency, this is the spot. As our resident methodology expert, we'll be looking to you for strategies that optimize data processor designs and reduce related time and costs. Primary concentration will be on partitioning techniques for distributed systems, approaches to incremental development, specification languages, coding practices, Science, Physics, or Electrical Engineering, coupled with experience in data processor and software engineering research, we'd like to discuss these opportunities.

Please call our Toll Free number 800-633-2090 Monday through Friday between 8 a.m. and 5 p.m. or submit a resume including salary history to the Personnel Department:

Performance Measurement Distributed Systems

San Francisco Peninsula

HP's General Systems Division R&D lab seeks a well qualified Computer Scientist/Electrical Engineer with professional interest and experience in the area of computer systems performance measurement as applied to data communications hardware and software products. The successful candidate will be working closely with experienced product development team in the following areas: HP distributed systems networks; HP to IBM communications; terminal intensive systems; communications processors/controllers; and network management products. Prior experience with the techniques and tools useful in performance measurement, analysis and specification in a general purpose multi-programming system environment is a requirement. Interest in communications network analysis is also highly desirable.

If you hold preferably an MS degree in Computer Science or Electrical Engineering, have 2 or more years' experience in the performance measurement environment, and desire to join a R&D team oriented toward technical contribution in the fast growing distributed business systems market place, then HP wants to discuss with you the significant role you can play in our distributed processing product development program. Send your resume in confidence to Hewlett-Packard, General Systems Division, 5303 Stevens Creek Blvd., Senta Clare, California 95050. We are an equal opportunity employer dedicated to affirmative action.

HEWLETT hp PACKARD

SYSTEMS ANALYST

The national corporate computing center at a large growing Spokane, Washington multi-industry firm has an immediate opening for a systems analyst. CAREER OPPORTUNITIES IN ADP

Los Alamos Scientific Laboratory

The University of California's Los Alamos Scientific Laboratory, a multi-faceted national R&D facility, is seeking experienced professionals to work in its Administrative Automatic Data Processing Department, which provides Laboratory wide computer services for administrative and business applications.

MINICOMPUTER APPLICATIONS SPECIALIST

Will work with administrative minicomputer system, assisting users in software selection, system installation, and system maintenance; and assisting in the development of administrative minicomputer applications. Some work with large-scale machines also required. B.S.-M.S. (preferably in a quantitative discipline) or equivalent experience and exposure to hardware evaluation desired. Two years software design and development experience and a working knowledge of at least two computer languages preferred. The applicant should also display a record of successful professional performance and a capacity for accepting increased responsibility. Good communication skills essential.

ANALYSTS/PROGRAMMERS

Will design, write, and maintain computer application programs that provide information for Administrative Services. Includes preparation of narrative system proposals, programs, procedures for machine operations, and user documentation. At least three years' experience in COBOL and business systems design required. Preferred qualifications: B.S.-M.S. in information systems, or related field, and experience in Data Base Managements Systems (S2K), CDC-6000 series hardware, and minicomputers for business applications.

The Laboratory, located in the beautiful mountains of northern New Mexico, offers excellent working conditions and benefits, such as professional growth opportunities and 24 days' annual vacation. Los Alamos provides a pleasing lifestyle with small-town friendliness, abundant recreational opportunities, and an excellent school system.

Computer Marketing Professionals...

Digital's Laboratory Data Products Group Means Exceptional Opportunities For You!

One of the major product line groups within Digital Equipment Corporation, Laboratory Data Products, is responsible for developing and marketing products for systems applications use in direct and experimental research. Our markets are located in all segments of the medical and research community, including the Federal government, universities, and private researchers.

Three exceptional opportunities are now available, all offering broad corporate exposure and potential for increased responsibility and growth, and a chance to broaden your professional perspective by working in a dynamic environment with a group of diversely talented individuals.

Industrial Research & Development Marketing

This high-visibility position requires an aggressive self-motivated individual who can handle a new marketing responsibility for the industrial R&D markets, one of the newest and fastest-growing application areas for minicomputer systems.

You should be capable of investigating, identifying, and developing plans and strategies for increased market penetration including penetration of the international marketplace. Working with a significant amount of independence, you'll also support the sales force when requested, including field presentations. Obviously, excellent interpersonal skills are essential.

A technical degree or equivalent with at least 2 years thorough exposure to industrial market research, preferably in engineering or chemistry, and a solid familiarity with minicomputers are required. Sales and/or marketing experience is a definite asset.

Federal Government Marketing

If you have experience in direct sales or marketing to government agencies, this newly created opening is an excellent opportunity to utilize it.

Your primary responsibility will be to provide the marketing emphasis necesasry to increase marketplace penetration in scientific systems sales to the Federal government, one of our largest marketplaces. Duties will also include preparing short and long term marketing plans, representing the group on corporate committees and in meetings with our Federal National Sales Group, and providing support to the sales force as needed.

We require successful experience in government scientific sales and/or marketing, preferably in minicomputer systems. An engineering or scientific degree or equivalent is also necessary for this growth and advancement opportunity.

Minisystems Marketing

We're seeking a professional who combines technical knowledge with business acumen to help run the minicomputers marketing group within Laboratory Data Products. You'll be involved in the daily business decisions as well as the development of strategies for short and long term product development, and will have an excellent opportunity to grow into managerial responsibilities.

Other duties will include sales support, short and long term forecasting, new product development studies, and competitive analyses.

You must have 3-5 years experience selling or marketing minicomputers, preferably to the scientific marketplace, and a technical degree or equivalent. An MBA is preferred.

These positions are based in Digital's Marlboro, Massachusetts facility, a 40 minute drive from Boston.

Marlboro and its surrounding communities offer you and your family an attractive residential lifestyle and convenient to the unsurpassed cultural, educational and recreational resources of the New England area.

If you are interested and qualified in these positions, please forward your resume COMPLETE WITH SALARY HISTORY to Douglas D'Agata, Digital Equipment Corporation, 200 Forest Street, Marlboro, Mass. 01752.

We're the company looking for people.

SYSTEMS PROGRAMMER

Our Corporate Data Processing Center, located in Fullerton, California, has immediate openings for Systems Programmers to become actively involved in converting our present system software to a new virtual system software in order to exploit the power of our recently acquired Amdahl 470V/6 computer. In addition, we are in the planning stage for installation of a data network capable of switching remote users to any of the several host systems located throughout Hughes Aircraft Company.

Positions exist for experienced persons in the following areas of expertise:

- On-Line Systems Programmers with experience on at least one of the following IBM Subsystems: ATS, IMS, System 2000 or TSO.
- Operating Systems Programmers/Analysts with experience in installation and support of the IBM MVS operating system. In particular JES 2/JES 3 or systems measurement and performance tuning.
- System Planners with experience in evaluation and selection of data processing equipment in the areas of: DASD Storage, Tape Storage, Mass Storage, Intelligent Terminals.

Applicants should have demonstrated ability to formalize evaluations and present alternatives to management.

Positions exist at all experience levels. Candidate selection will depend on experience, capability, and self-motivation.

Qualified applicants should send their resumes to: Professional Employment, Department N-1, Ground Systems Group, P.O. Box 3310, Fullerton, CA 92634.

SOFTWARE DESIGNERS AND SYSTEMS ENGINEERS FOR TRANSACTION PROCESSING

Transaction Technology, Inc. (TTI), a subsidiary of Citicorp, is dedicated to the design and development of electronic banking products, and specifically, Electronic Funds Transfer Systems. Our continued advancement and achievement is due to a strong recognition of the need for high technology, and the commitment to a staff of talented individuals who make it all happen.

We are currently seeking qualified individuals with extensive background in on-line real time systems, experience with large data bases and knowledge of communication networks for the following areas:

SYSTEMS ENGINEERING: Minimum of 3 years experience in the hardware/software development of interactive systems, data base management and/or associated communications systems. Responsibilities will include planning, architecture and design of a new transaction processing network. Seeking individuals with experience in:

- Operating systems for time sharing and real time processing.
- Distributed data base processing and integrated data bases.
- Applications processing.
- Communication subsystems for switching, concentration, network and terminal control.
- Dial-up, private and public data network offerings.
- Intelligent terminals.

DIAGNOSTIC SOFTWARE: Hands-on hardware experience in minicomputers and ability to read logic diagrams. Background in large rotating memories and microprocessors is a plus.

COMMUNICATIONS SOFTWARE: Sound background in interactive network information systems, communications protocols and message switching. A working knowledge of dial-up private and public data networks is required.

SYSTEMS SOFTWARE: Minimum of 3 years experience in one of the following areas:

- Operating Systems: Background with interactive real time, large data base systems; task scheduling; reentrant code and error diagnostics.
- Data Base Management: Working knowledge of sophisticated access routines and file recovery techniques for large data bases.
- System Performance: Experience in system performance analysis and reliability.

MICROPROCESSOR SOFTWARE: Experience in the design of microprocessing firmware applications or diagnostics using the Intel 8080 for network terminals.

SYSTEMS ANALYSTS/APPLICATIONS SOFTWARE: Ability to design and develop software for banking and retail service applications. Background in financial/banking credit authorization systems a definite plus.

QUALITY ASSURANCE: Knowledge of data center operations and experience with system testing, integration and verification. Applicants should also have background in software maintenance and support.

TTI offers an exceptional salary and benefits program which includes a comprehensive group insurance program, pension plan and education assistance to name just a few. We are surrounded by beautiful suburban communities, just minutes from beaches, mountains, deserts, various cultural centers and, of course, Disneyland.

With TTI, you can have the best of both worlds . . . the rewards of a stimulating work environment coupled with the joys of Southern California living! If you thrive on challenge, are committed to quality, and want to work in an environment where your ideas are respected, let's discuss your future and ours. Send your resume, including salary history, in complete confidence to.

Attention:

Data Processing Distributors
Data Processing Consultants
Data Processing Service Bureaus

Datapoint Corporation, the Leader in Dispersed Data Processing, is establishing a network of Sales Representatives to augment its direct sales force. Datapoint Corporation designs and manufactures a broad range of dispersed processing and business computing systems, together with a complete line of software and peripherals.

Three types of representatives are being sought:

General Software Representatives

Service bureaus of software consulting companies which specialize in the development of applications software utilizing Datapoint hardware are invited to apply. These firms may be located in geographic areas in which Datapoint has direct sales offices.

Industry Software Representatives

Also sought are companies which specialize in developing software systems for Datapoint hardware to be used in industries such as commercial banking, savings and loan, medicine, and real estate.

Territory Representatives

Representative companies are needed to market the Datapoint product line within geographical areas assigned by Datapoint where there is at present no direct representation by the company.

Datapoint offers maintenance services throughout the United States. Interested parties should contact Mr. Pat Blakeney or Mr. Pat Magalagan at (512) 699-7850 Datapoint Corporation, 9725 Datapoint Drive, San Antonio, Texas 78284.

DATAPOINT CORPORATION

The leader in dispersed data processing™

Want your printer to SHOUT? Then BANNERIT!.

This ANS COBOL program will print your tttty char. message (any alpha or numeric) in letters over one foot high! Source deck $40.00.

Need to picture your progress? GRAPHIT will print a simple point or bar graph from your input parameters. Source deck $40.00.

Sample output and description of either program $1.00.

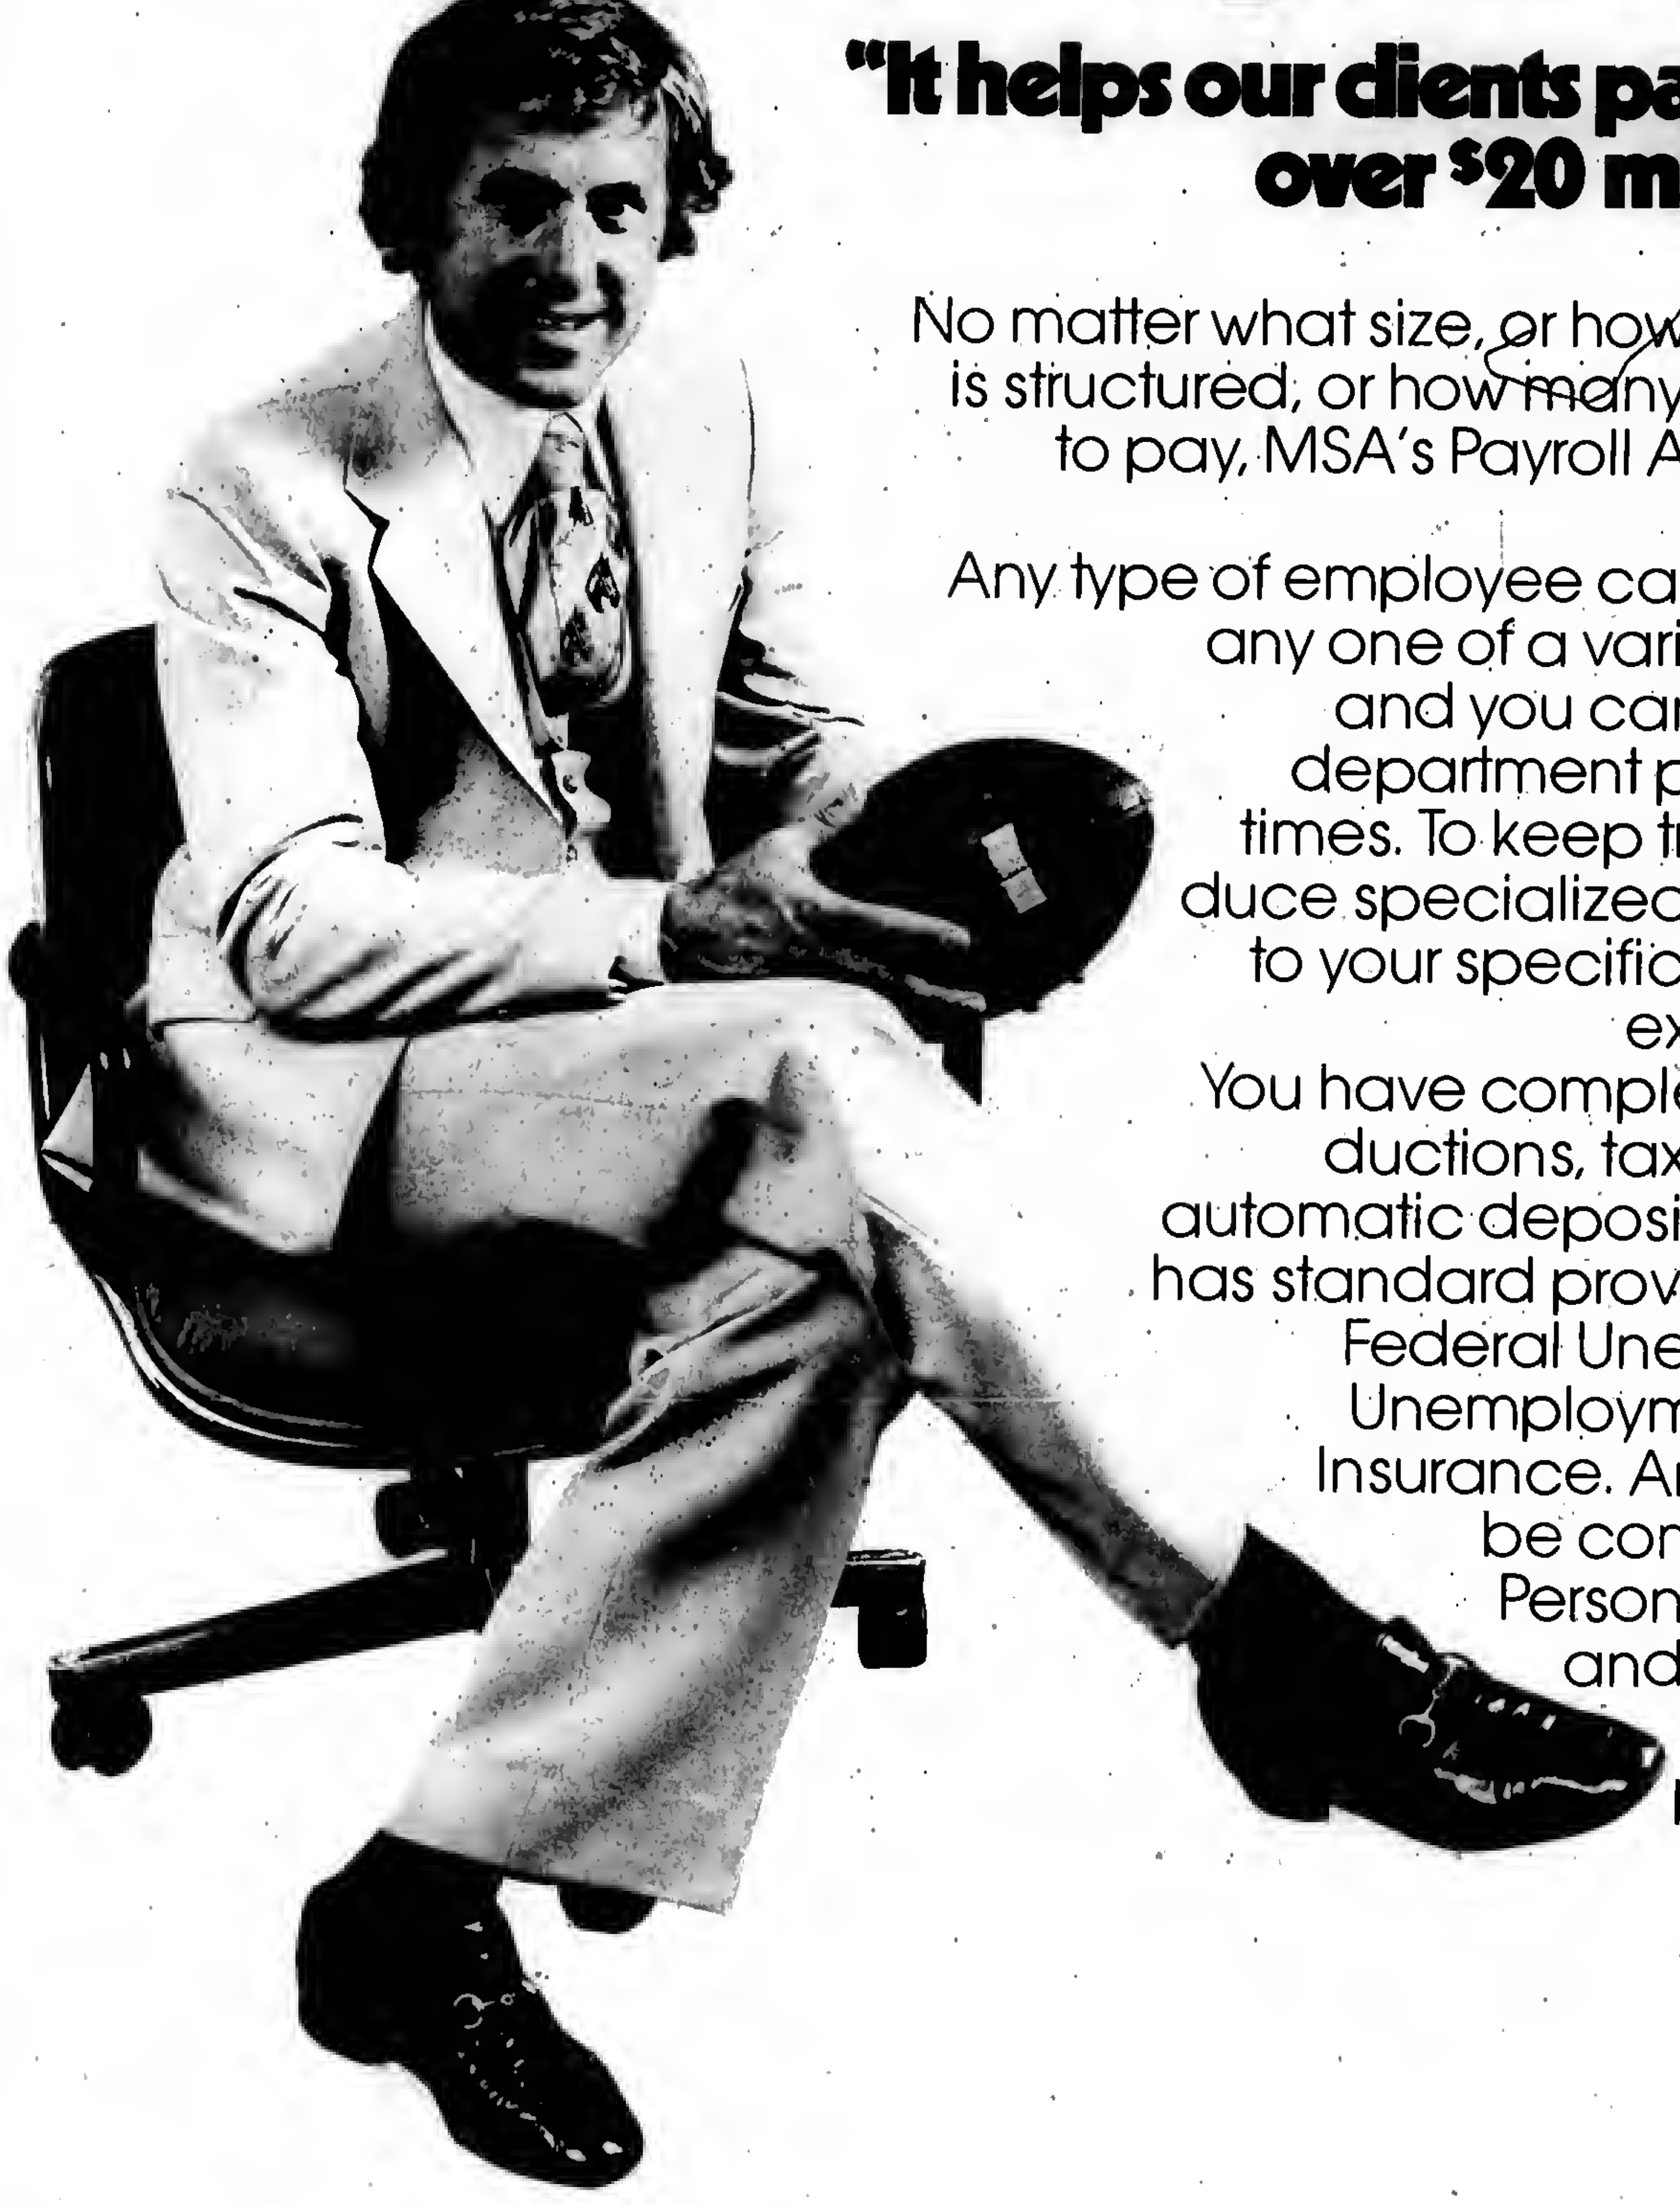
"Check the Scouting Report on MSA's Payroll System."

"It helps our clients pay employees over $20 million an hour."

Francis Tarkenton, MSA



No matter what size, or how your organization is structured, or how many payrolls you have to pay, MSA's Payroll Accounting System can handle it.

Any type of employee can be paid through any one of a variety of pay periods and you can process different department payrolls at different times. To keep track, you can produce specialized reports designed to your specifications without any extra programming.

You have complete flexibility in deductions, tax withholdings and automatic deposits. The system also has standard provisions for handling Federal Unemployment, State Unemployment and Disability Insurance. And this system can be combined with MSA's Personnel Management and Reporting System to provide improved employer-employee relationships.

Member SIA Software Industry Association

If you're scouting for a more effective, timely and accurate way to handle your organization's payroll, call Marge Kimbraugh at (404) 262-2376 or mail this coupon.

DP Deprives Workers Of Job Satisfaction, Europe Studies Show

By Nancy French
CW Staff

TORONTO — From banks to machine shops to steel mills, workers whose jobs have been changed by computerization have been deprived of at least some job satisfaction, panel members agreed here earlier this month.

Moreover, most of computerization's social consequences are "totally accidental and when "positive" changes do occur, it's a result of "sheer luck, according to Niels Bjorn-Andersen, an associate professor at the Copenhagen School of Economics and Social Science.

These findings were presented at the International Federation for Information Processing (Ifip) Congress 77 here recently during a session on the impact of computerization on work content and job satisfaction.

Peter Docherty, a professor of business administration at the Stockholm School of Economics, described a banking system developed on a management premise that 80% of its workers were "disinterested" in their work. The system, management theorized, should be as simple as possible, placing a minimum of job demands on the tellers who would be using it.

The results were surprising, he said, and were compiled through the bank's suggestion program.

Before the teller operation was computerized, tellers suggested changes that would improve customer services. They were, by attitude, "minibankers."

After computerization, their suggestions concerned added codes, new forms or new displays. Within a year, basic attitudes within the bank had been changed. Minibankers had been turned into keypunch operators, he explained.

Managers who noted the change are now asking themselves who is worrying about customers besides a few bank executives, Docherty said.

Bjorn-Andersen, who studied eight banks in Sweden, England, France and

No Argument: 'DP Causes Unemployment'

By E. Drake Lundell Jr.
CW Staff

TORONTO — Computers cause unemployment.

That's about all a recent panel could agree on at the International Federation for Information Processing (Ifip) Congress 77 here.

One panelist argued that while DP causes local unemployment, it actually creates more jobs in other areas. Another contended strong unions could reduce this effect. A third pointed to a need for a dramatic change in social organization to overcome the problem.

Dr. Bruce Gilchrist, director of computing activities at Columbia University, took the first position by indicating that while computers cause unemployment in certain geographic areas, in a global sense they help create jobs.

For example, he said, the AT&T workforce has dropped 7.5% in the past five years — a loss of 75,000 jobs, many directly attributable to automation. In the same time, AT&T's revenues have risen by $6 billion.

That increased revenue is being spent on goods and services by AT&T itself or by people who get the profits from the company, therefore creating more jobs in other areas than were lost at AT&T, he contended.

Because of this, Gilchrist is optimistic that on the global level computers will increase employment, even though he is pessimistic about the effects on individual workers who lose jobs through automation.

For example, he said, while there is high unemployment in the ghetto areas of New York, just 50 miles away there are job openings in high technology areas.

The problem is that "we have al-

Technician Paul Schoen makes simulated in-flight adjustment during avionics system checkout in space shuttle orbiter craft at Rockwell International's Space Division in Downey, Calif.

Mini Sizes Up Electronics During Flight of Enterprise

By Jeffry Beeler
CW Staff

DOWNEY, Calif. — While an unpowered prototype of this country's space shuttle was successfully completing its first solo test flight recently, a minicomputer system was evaluating the crucial electronics that will guide and control the craft — and others like it — during the 1980s.

Scientists and engineers at Rockwell International's Space Division here used the system to test both the vehicle's on-board avionics and the general-purpose computer that will someday oversee that hardware.

The test system is one of many computerized tools being used in the National Aeronautics and Space Administration's (Nasa) effort to develop a fully operational version of the space shuttle by early 1979. The latest step in that effort occurred at nearby Edwards Air Force Base on Aug. 12, when the shuttlecraft Enterprise was jettisoned from its Boeing 747 mother ship and glided to a perfect landing five minutes later on a dry lake bed in southern California's Mojave Desert.

Developing and integrating the shuttle's flight control computer with the avionics represents one of the most complex undertakings we've managed," according to Paul Liles, director of Rockwell's Avionics Development Laboratory, where the test system operates.

Liles credited the system with cutting the lab's test-data lead time to about two days. Before they acquired their current configuration, the lab's engineers often had to wait as long as four days while the results of their electronics tests were processed at

Federal Planning Unit Urged For U.S. Information Policy

By Edith Holmes
CW Staff

WASHINGTON, D.C. — President Carter's executive branch reorganization should include the creation of a body to plan and coordinate a national "information policy," according to a report released here recently by the Department of Commerce's Office of Telecommunications (OT).

Why? Because 46% of the U.S. gross national product (GNP) is derived from producing, processing and distributing information, according to the study, which claimed to measure information's place in the national economy for the first time.

Entitled "The Information Economy," the nine-volume report also pointed out that nearly half of the American labor force is engaged in information "activity."

Furthermore, these workers — in industries as varied as education, research and development, management consulting, common carriage, computer manufacturing and newspaper production — take home 53% of the nation's total wages, author Dr. Marc Uri Porat said.

New applications of telecommunica-

Sparked by Sharansky Case

Ifip Groups Take Stand for Rights

By E. Drake Lundell Jr.
CW Staff

TORONTO – The issue of human rights for Russian citizens arose during the recent International Federation for Information Processing (Ifip) Congress 77 here as more than 100 computer scientists signed a petition supporting the release of Anatole Sharansky, a computer scientist currently in Soviet prison.

In addition, the Association for Computing Machinery's (ACM) executive committee, which held a meeting in conjunction with the Ifip show, adopted a resolution refusing to participate in Soviet-sponsored conferences because of that country's "restraints on computer people."

The 15 participants in the Second International Chess Tournament also signed a letter to the Russians calling for the release of Sharansky.

Sharansky, the immediate cause of the furor over the rights of Soviet citizens, is a 29-year-old computer scientist charged with being an agent of the U.S. Central Intelligence Agency. He has been held in Soviet prison for the past five months.

Sharansky had attempted to emigrate from the Soviet Union to Israel. Because of this he was fired from his job and refused new employment.

He became active in Soviet dissident circles and contacted Western scientists and newsmen interested in the plight of Soviet citizens, according to a spokesman for his wife, who is now in Toronto.

Because of his activities in support of the right to emigrate, which are guaranteed by the Helsinki Convention signed about two years ago by the U.S. and the USSR, Sharansky was jailed originally for "parasitism and hooliganism," the spokesman said, and later charged with being a CIA agent.

In the past five months, no one has been allowed to see or speak with Sharansky, he added, so there is no real assurance he is even alive.

Sharansky a 'Symbol'

The ACM resolution, revealed at a well-attended, ad hoc evening session of the Congress, did not mention Sharansky by name, but referred instead to the general "Russian restraints on computer people."

It said ACM will "not cooperate with any meeting in the USSR" and that the association will "question" participation in any meeting with Russian support.

Dr. Herbert R.J. Grosch, ACM president, said Sharansky is "a symbol of a larger battle." ACM is concerned with intellectual and scientific freedom everywhere, he said, because abridgements to such freedoms "threaten human freedom everywhere."

Dr. Jack Beltzer, a computer scientist at the University of Pittsburgh, told the ad hoc meeting that "science can only exist where freedom of ideas can proceed.

"None of us are free until he is free," Beltzer said, referring to Sharansky.

Pressure Urged

Other panelists called on the assembled Ifip delegates to exert pressure in their own countries to deny Western Computer technology to the Soviets until they give the basic human rights called for by the Helsinki declarations to their citizens.

And Prof. Kelly Gotlieb told the group it should threaten to withdraw contracts with Soviet scientists in such meetings as Ifip unless the Russians change their policies on such human rights issues.

In response to that plea, the ad hoc group adopted a resolution expressing "our dismay of the treatment accorded to Anatole Sharansky."

Release Asked

In the remaining action, 15 members of the delegations participating in the Second World Chess Championships sent a letter to the Soviets urging them to release Sharansky, whose master's thesis dealt with programming computers for chess matches.

The group said his release "would help ensure" that contacts between Soviet computer people interested in computer chess and others of a like bent around the world could continue.

Info Sets Miniconferences

NEW YORK – The latest technological innovations in information systems and predictions for information systems in the 1980s will be the subjects of a four-day "conference-within-a-conference" at the Information Management Exposition and Conference.

About 250 speakers will address 70 sessions in 13 such miniconferences during Info 77, which will be held Oct. 17-20 at the New York Coliseum.

Other miniconferences scheduled include a half-day session entitled "Data Communications Planning for the 1980s," chaired by Dr. David Freeman, senior associate at Ketron, Inc.; and a seminar – involving Honeywell vice-president C.A. Conover and Citibank vice-president Jon Gould – on the pros and cons of replacing mainframes with groups of minis.

The full program and a guide to the exposition are available from Clapp & Poliak, Inc., 245 Park Ave., New York, N.Y. 10017.

Employees Fake $500,000 in Medicaid Claims

By Ann Dooley
CW Staff

TWINSBURG, Ohio — Tired of bureaucratic hassles with the Ohio welfare department, two employees of Revco D.S., Inc. here tried to take the easy way out by instituting a false prescription billing system. False claims amounted to more than $521,000, according to the drugstore chain.

The two were "frustrated by a substantial backlog of billings that had been rejected by the state over a period of time," a company spokesman said. In order to expedite the process, Myron Winkelman, vice-president of professional services, and John Turk, prepaid prescription program managers, instructed their clerical employees "to doctor" Medicaid claims at two stages of the billing process, according to George C. Smith, prosecuting attorney.

Fabricated New Claims

Employees were told to make up new bills to replace those rejected by the state or fix claims rejected by Revco's own computer before the welfare office had seen them, Smith said.

Revco's computer, which handles the billing operations, is programmed to reject improper claims before they go to the welfare office in order to alleviate the number of inaccuracies encountered by that agency.

Claims are returned for reasons such as recipient ineligibility, duplication or incorrect or incomplete information, Smith explained.

Rather than resubmitting returned claims, the two employees decided to "fabricate new claims. It was easier for them to hook a false claim onto a legitimate one than to analyze what might be wrong with a rejected claim," a spokesman at the prosecutor's office said.

The clerical workers were told to use "model claims" — prescriptions that had already been accepted by the state and paid, Smith said.

Plead No Contest

The two men pleaded no contest in Franklin County common pleas court to misdemeanor counts of falsifying prescription billings.

Judge Jay C. Flowers fined Revco $50,000, the maximum fine for a first-degree misdemeanor, and ordered the company to pay the state the full $521,000 in restitution. Winkelman and Turk were each fined $2,000.

The scheme was discovered after an Ohio welfare worker making a routine audit of prescriptions noticed pairs of prescriptions were being billed to the account of the same welfare recipient two or three days apart. The prescription numbers of the bills were nearly identical, according to Smith.

Revco said "virtually all" of the improper billings covered "actual transactions that had previously taken place in Revco stores and that involved dispensing prescriptions to welfare recipients." Some of the bills will be corrected and resubmitted to the welfare department for payment.

Investigators found 208,539 improper or disputed claims from all 159 Ohio Revco stores.

The two men acted "without the knowledge of other corporate officials," according to Smith. The company had no comment on what, if any, action it might take against Winkelman and Turk.

After the court action, the Ohio Welfare Department lifted the suspension set on Revco during the investigation.

The billings have reached more than $700,000 and payment of the backlog will begin "subject to normal start-up measures," Revco said.

Since the scheme was discovered, both Revco and the welfare department have established new controls on paper work and computer workflow to avoid a similar incident, a spokesman said.

Mass. Rebids Second Contract

BOSTON — For the second time in several weeks, the Commonwealth of Massachusetts has been forced to reopen bidding on a contract that had already been awarded.

The $19.5 million Medicaid contract granted recently to Blue Cross/Blue Shield with a subcontract to Electronic Data Systems Corp. (EDS) was withdrawn after several other bidders filed complaints [CW, Aug. 8].

After hearing the evidence, a review board recommended to Gov. Michael S. Dukakis that all the bids be reevaluated.

The review board action followed hard on Dukakis' decision to halt a $23 million facilities management contract also awarded to EDS, because of an apparent conflict of interest.

In that case, two members of the selection board that awarded that job were also officials of Sci-Tek Associates, a firm involved with EDS in a contract in Tennessee [CW, Aug. 15].

Although Sci-Tek has been barred from further participation in the Massachusetts facilities management plan, EDS said it will bid again.

In the Medicaid case, the review board found two of the five bidders, Citibank and Pilgrim Health, were denied oral argumetns to defend their proposals and clear up any misunderstandings, a spokeswoman said.

A new selection committee is being formed to look at the companies that wish to rebid.

ADR SOFTWARE HELPS LEEDS & NORTHRUP MAKE SENSE OUT OF THE ENVIRONMENT.

With the help of ADR software, Leeds & Northrup's Corporate Systems department administers and schedules critical resources in an ever-changing environment.

Thirteen full-time programmers maintain, service and improve a library of over 3,000 programs that range from payroll and accounting systems support to systems for control of parts and materials. In the eight months that ADR's ROSCOE™ On-Line Conversational Programming System has been in use, maintenance time appears to have been reduced 50% from the system previously used. This comes to an estimated cost avoidance of $26,000, which will pay for the entire cost of ROSCOE and its maintenance on four terminals in its first year.

JCL errors heve elso been markedly reduced. Instead of filling out lengthy JCL cards, keypunching and waiting up to four hours to get cards into the system, the programmer just sits at a ROSCOE supported remote terminal and keys in requested information shown on the CRT display. JCL is in the system in three minutes or less. If an error is made, the programmer knows about it immediately and can correct it on the spot.

ROSCOE's direct eccess conversetionel data entry features give the sequence of information that is needed eutomaticelly. What's more, the information goes directly to the system without stops and delays usually associated with manual data entry.

Joe Dupon, Manager of Computer Technology, credits these features with meny dramatic sevings in time and increases in efficiency through reduced coding and programmer keying time, reduction of manual operations, less waiting for data entry, fewer chances for error, and reduction of error correction time.

Other ADR software that Leeds & Northrup has installed includes The Librarian® and MetaCOBOL®.

The Librarian safeguards the maintenance and retrieval of application programs. MetaCOBOL was used to convert from DOS ANS Cobol to OS ANS Cobol in less than half the time Joe Dupon estimated it would take.

According to Joe Dupon, "an important point about ADR's software products—ROSCOE™, LIBRARIAN and MetaCOBOL—is that they have always worked to specitications. The program packages that have been shipped to us have had a virtual zero defect level. As a result, we have never hesitated to put them to work in our system without the lengthy trial and test procedures we normally use with other products."

For more information on what ADR software can do for you, call or write Applied Data Research, Inc., Route 206 Center, Princeton, New Jersey 08540. Phone: 609-924-9100

Scandanavian Laws Give Workers Vote on DP

By Nancy French
CW Staff

TORONTO – The governments of three Scandinavian countries have passed laws to protect workers from changes in their jobs brought about by computerization, according to Niels Bjorn-Andersen, an associate professor at the Copenhagen School of Economics and Social Science.

Bjorn-Andersen, who appeared on a panel convened to discuss the impact of computerization on work content and job satisfaction, said the laws fall under the category of work protection acts. All three require systems designed to take human factors into account in designing new jobs, Bjorn-Andersen told attendees at the session held during the International Federation for Information Processing (Ifip) Congress 77 earlier this month.

Swedish Act Lacks Teeth

The codetermination act passed by the Swedish Parliament establishes as a general principle that every employee whose job is changed by computerization has a right to be consulted. However, no details or regulations back it up.

In Norway, however, the law is supplemented by an agreement between the Trade Union Association and the Employers Association. This agreement provides that companies inform the trade unions ~~and users~~ "at the feasibility-study phase" of systems designs that would lead to computerization of their jobs.

No such principle has been adopted in Denmark.

In Denmark, Norway and Sweden about 90% of clerical workers are unionized, Bjorn-Andersen said, making such laws of significant importance to company management.

In at least two cases, systems were vetoed by union personnel under the laws, he noted. One was a one-way on-line data entry system scheduled for implementation at a manufacturing company. After the workers studied the proposed system, a strike was threatened, he said, and management substituted a system that used interactive terminals for the one-way system originally designed.

In another case, IBM's Class package was installed in a job shop to aid in planning production, he said.

The system turned out to be objectionable to workers for several reasons.

First, it was inflexible. Because of the way it accounted for manufactured items, all overtime was being scheduled on the weekends.

Secondly, it eliminated cross-contact between the workers, which they found unpleasant, according to Bjorn-Andersen, who noted this system was also withdrawn.

Studies Show DP Erodes Job Satisfaction

(Continued from Page 1)

Denmark, explained that results were not necessarily consistent from bank to bank, since each designed its computer system differently. However, in many cases work became more repetitious and routine as tellers were turned into part-time keypunchers, he explained.

In other cases, tellers actually had more time to spend with customers as the routine repetitious jobs were assumed by the computer.

All Jobs More Programmed

However, overall jobs became "more structured, more programmed and more preplanned," Bjorn Andersen said, adding in each of these cases systems designers had "assumed there would be no changes."

Systems designers must be aware of the connection between computers and work satisfaction. In designing systems they must take into account the psychological components of human beings — their motivations and aspirations, according to Otto Zich of Voest Alpine AG, a steel company in Linz, Austria.

Zich illustrated the magnitude of the problem by explaining that 50% of the steel mill's employers are involved in "information processing" today, compared with 15% only 27 years ago. Further, less than 10% of the steel mill's employees actually do any physical work.

It is essential that work involving computers be "humanized," he said.

Dr. Josef Hatrany of the Hungarian Academy of Sciences' Institute for Computer Sciences described one system that does just that.

The system, which was implemented to speed production in a machine tool shop is designed to "make the computer" the machinist's friend, Hatrany said.

The machine room controller and the tool machine are in the workshop while the computer itself is in the computer room. The worker may have a "dialogue" with the system, he said.

He may ask the system what parts need to be machined and decide what parts he wishes to make first, for example.

Tool cutting values also may be modified by the worker whose years of experience tell him that the parameters set by the system are not the best.

The master-slave relationship is "unambiguous"; the human is always the master, Hatrany explained.

The system is designed so the worker can make decisions without modifying the computer's decision tree — and without having a confrontation with the machine, he noted.

Confrontations Human

"In all hierarchies confrontation is inevitable," Hatrany said, but this system is designed so all confrontations are human — between the workman and his human boss.

In discussing the problem with attendees, the panelists urged that systems designers invite sociologists and psychologists to participate on design teams.

New performance measures must be developed that account for non-economic considerations, one panelist suggested.

Another suggestion was "participative design" — or involving users rather than only expert designers in the development process.

By "users" the panel members explained they didn't mean the head of the user department but rather a large number of workers whose jobs it would be "to sit at the terminals."

Mini Sizes Up Enterprise

(Continued from Page 1)

Nasa's Lyndon B. Johnson Space Center in Houston and then returned here for evaluation.

Liles also credited the system with allowing his staff of eight programmers to simultaneously debug and update software for the first time since the laboratory was established in 1973.

Machines Swamped

Before they acquired their current test system, the lab's engineers evaluated their avionic hardware with a battery of five stand-alone Data General Corp. Nova 840 minicomputers. But as the number and complexity of the lab's electronic tests increased, the original configuration soon became swamped by the growing DP workload.

Moreover, the 840s could perform only one DP task at a time, Liles recalled.

To overcome these drawbacks, the lab supplemented its existing test system with seven additional minis — four for data acquisition and reduction, one for program generation and two for controlling simulation programs. One of the computers, a DG Eclipse S200 system, generates all the laboratory's test procedures, which it then forwards to two additional S200s, which run the programs.

An eclipse C300 processor and three Nova 2 computers, meanwhile, collect test data and perform the arithmetic compilations used in determining test status.

Before they installed their latest minicomputers earlier this year, Liles and his colleagues in the laboratory had considered expanding their avionics test system with an IBM 360. Two factors, however, ruled out that alternative, Liles explained.

First, the large-scale system, unlike the DG minis, would not have been compatible with the lab's existing test equipment, and the cost of linking the 360 to the Nova 840s would have been prohibitive.

Second, the nature of the laboratory's hardware tests demands a real-time, dedicated computer system, not a remote batch unit like the IBM 360.

"When you're doing electronics test of this sort, you don't want to wait for your results," Liles said. "You can't afford to go into a queue or a batch mode."

**Now from Digital–
a low-cost paper tape reader.**

The PRSO1, Digital's new low-cost, portable paper tape reader for high performance terminals.

Now you can easily load your programs, bootstraps and diagnostics into any make or model of computer or terminal you currently own through an approved 20 mA interface. Available in 300 baud and 2400 baud versions, the small (12"x8") and light (3kg) (6.5 lbs.) self-contained unit can go just about anywhere you need an input device. All for a mere $750.

For complete information on the PRSO1, call your nearest Digital office; or write Digital Equipment Corporation, Traditional Products, 125 Northeastern Boulevard, Nashua, N.H. 03060.

Witness Affable, Cooperative

Withington Still on Stand, IBM Trial Plods On

By Molly Upton
CW Staff

NEW YORK — As the days of summer grind on, the self-proclaimed "Son of Sam" is captured and the memories of the great blackout of 1977 begin to fade here, the U.S. antitrust suit against IBM continues to plod along, with all participants hoping for an early break in the action.

And, ironically, the man who fought hardest against being a witness for the government has now been on the stand longer than any other participant so far.

Frederic G. Withington, a computer industry expert with Arthur D. Little, Inc., fought a subpoena for his testimony here in the Second District Court for New York up to the U.S. Court of Appeals, where he was turned down. The appeals court refused to quash the subpoena because of the importance of the case and on some technical grounds.

He now holds the record of being on the witness stand the longest — 21 days — and for producing the most pages of testimony — over 3,000 — in this trial which is in its third year with little relief in sight.

Despite New York's muggy heat and length of time he has spent on the stand, Withington has been affable, succint and cooperative — to both sides in the case.

In fact, he is quite "proud" of his record and said everything he knows about the computer industry can be found somewhere in the transcript of his testimony.

Withington's knowledge of the industry is broad enough to make his testimony of interest to both IBM and the Justice Department; while the government kept him on the stand four days for direct examination, IBM cross-examined him for 12. The remaining days have been taken up with redirect and recross-examinations.

In addition to his general knowledge of the industry, Withington brings some personal expertise to the case since he has consulted directly with some of the firms in the business including IBM itself, Honeywell and RCA when it was still active in the field.

Little Time Wasted

But while Withington's testimony has been going on, courtroom participants have been hoping for the two-week recess promised by the judge when Withington leaves the stand.

As a result, there has been a minimum amount of time wasted recently — a condition not found in earlier portions of the case.

Judge David N. Edelstein has been quite abrupt with Ron Rolfe, an attorney for IBM. Edelstein has declined to hear Rolfe's reasons for objections and at least once admonished him severely, telling him to sit down.

Although David Boies — another IBM attorney — will stay on the case through the testimony of the government's main economic witness, Dr. Alan K. McAdams, Boies said he's looking forward to the vacation. After finishing up with this case, he is slated to become chief counsel for the Senate Antitrust and Monopoly Subcommittee, which is looking at various proposals to update the antitrust laws.

Another man planning to leave the case in the near future is the government's lead attorney, Raymond Carlson, who says he's looking forward to retiring and devoting full time to the tennis court.

Carlson will be replaced by Robert Staal, formerly of the Justice Department's San Francisco office, who has been waiting in the wings since July. Staal will lead the Justice team during IBM's defense of the case.

In the past, the government had predicted it would finish its case by Labor Day, but that now appears impossible. First there will be the vacation, then McAdams will resume the stand and will probably be cross-examined for several weeks. The government then plans "a couple" more economic witnesses to wind up its case.

If everything goes perfectly, one person close to the case indicated last week, the government might be finished by mid-October. Late November is probably more likely, however, he said, chuckling when asked if January wouldn't be more like it.

As usual, the contrast between the strength of the teams is overly apparent. Carlson, who fills his own water pitcher, is conducting this portion of the case with one assistant.

The IBM table, meanwhile, is replete with Cravath, Swaine and Moore attorneys Ron Rolfe, George Hritz, David Boies and Morris Waisbrot.

DPer Sought by FBI Found Dead in Motel

KANSAS CITY, Mo. — Henry Joseph Manning III, a systems analyst sought by the FBI for embezzlement and bank fraud [CW, July 25], was located late last month "as a direct result of the photograph and article" about him in *Computerworld*, the FBI announced here last week.

Located in Denver, Manning took his life in a motel room before police were able to apprehend him...

CICS Users...

Your monitor doesn't do enough for you.

TASK/MASTER® Version II

- **Has better network management facilities**
- **Is much easier for application programmers to use**
- **Has a better restart and recovery system**
- **Makes "mapping" easier and more flexible**
- **Is far easier to install, maintain, and operate**
- **Has more flexible terminal support**
- **Has better database support**
- **Has better facilities for report transmission**
- **Has more programmer-productivity features**
- **Has better message switching facilities**
- **Has better statistics and diagnostic aids**
- **Plus a lot more**

And now you can move up to TASK/MASTER automatically.

Our new CICS-to-TASK/MASTER Converter turns source programs written for CICS into source programs which run with TASK/MASTER. Write or call today for the details. We'll do our best to enlighten and liberate you.

Planning Body Urged for Information Policy

(Continued from Page 1)

tions and computer technologies — the core of the "information society" the U.S. is about to become — will continue to cut across all other sectors of the economy and their impact is "too important to be left to technologists," Porat maintained.

"Decisions that are made . . .*within* the communication policy and business worlds can affect many external constituencies whose voices and concerns are not always heard by those making decisions about information technology," Porat said.

"When we restrict the scope of policy attention to the pitched battles and fireworks within the telecommunications-cum-computer world, our perspective is too narrow, and society's interest is not properly served," he added.

Coordination Missing

At a time when the successor to the industrial society is upon the U.S., the federal government lacks any information policy coordinating mechanisms, Porat stated. He suggested the creation of an "information policy forum" is "the main recommendation of this study."

Prepared by an OT research team led by Porat, the project was based on 1967 labor, economic and census statistics. It was funded by the National Science Foundation's Division of Advanced Productivity Research and Technology.

The first two volumes of "The Information Economy" contain the study's methodology, major findings and recommendations. In these volumes Porat defines "information" — "Data [that has] been organized and communicated" — and breaks "information activity" — "the resources consumed in producing, processing and distributing information goods and services" — into two sectors, primary and secondary.

The "primary information sector" encompasses firms supplying information goods and services exchanged in the marketplace; the "secondary information sector" includes all information services produced for internal consumption within government and within noninformation firms.

Formal Set of Accounts

The report constructs a formal set of national income and product accounts for these two information sectors. Two input/output matrices provide an overview of the interrelationships among the varied types of information and noninformation activities.

The study further specifies the information-related occupations of the primary and secondary information sectors. Since the mid-1950s, the information sector has employed the highest percentage of the U.S. labor force, Porat determined.

Information policy issues tend to be "horizontal" in their impacts, he said in his study. Porat cited as examples of these impacts "the edgy and uncomfortable feeling in the U.S. Postal Service as electronic mail approaches" and the "polite realignments in the finance industry as electronic funds transfer systems threaten to extinguish certain distinctions between commercial banks and savings and loans."

The federal government, however, makes policy on a "verlical basis — within the communications and computer industries through the Federal Communications Commission, the Office of Telecommunications Policy at the White House through OT and with the "assistance" of private-sector interests, Porat noted.

Those agencies willing to tackle the economic and social conflicts generated by the introduction of new information technology applications generally do so on a parochial basis, often not even referring to the vertical issues within the communications and computer industries themselves, he said.

The "forum" proposed in the study should be an interagency-coordinating body in the executive office of the President, Porat stated.

When the home is transformed by the communications center and the information utility, the information society will have arrived in the U.S. That is only one generation away, according to Porat, who warned that is the length of time left to attack the issues brought about by information technology.

The Solution

The solution is "a coherent national information policy; and the legislative and executive will to confront the issues in a sensible manner," Porat contended.

In addition to recommending that Carter establish the forum within the White House, the study suggested the Commerce Department's Bureau of Economic Analysis review the usefulness of constructing permanent information sector accounts.

No Argument: DP Causes Unemployment

(Continued from Page 1)

lowed these disruptions to be under the control of individual companies," he said, adding companies are much more flexible than workers and can make changes — either through automation or geography — without retraining the displaced workers.

At the same time, however, automation cannot be limited he claimed, because that would limit capital investment, which creates jobs.

"We need to relate the production of jobs with the reduction of jobs." This would take a national program and central planning in order to train workers for the jobs available and to retrain those workers displaced from one job for newer jobs, he explained.

Ulrich Briefs, a West German economist, said the problem of unemployment caused by computerization is not just one of technology, but also of the overall stagnation of the economies of the Western industrialized nations.

Briefs, who is with the Institut des Deutschen Gewerkschaftsbundes GmbH in Dusseldorf, noted that computers are one of the most powerful labor-saving tools and are therefore primarily used as substitutes for labor.

While the effects of computerization on employment are not clear now, he said computers have displaced at least as many jobs as they have created.

The effects are most visible in the clerical and production areas at present, but he warned that with the advent of heuristic programming and automated decision-making systems in the future, computers will begin to replace management-level personnel.

Today, 40% of the white-collar unemployment and 20% of the blue-collar unemployment in Gemany can be directly attributed to computerization, he said, adding that computerization accounts for about 15% of all jobs lost since 1970.

"But this is far from the peak," he said. For example, the wide-scale use of word-processing equipment in West Germany could cost as many as 1.5 million jobs in the future, he predicted, noting total German DP employment accounts for only 250,000 jobs now.

Briefs also noted that while computer stock installations have been increasing in Germany over the past two years, the nation has gone from full employment to an unemployment rate of 4.5% at the present time.

The only way to avoid this is to get the economy growing at a faster rate than computerization so there are enough new jobs for the workers displaced by computers. This means a change in the economic system in many Western countries and more nationalization of industry, he said.

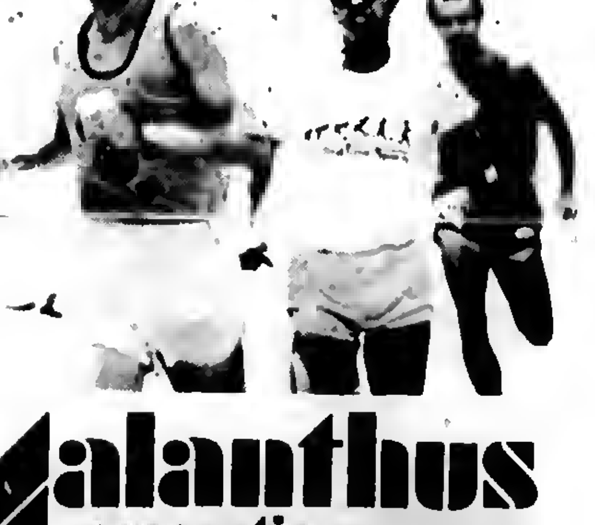
Jean-Claude Parrot, president of the Canadian Union of Postal Workers, said it is clear that employers "see the effect of computers as fewer workers and greater profits.

"Computers," he said, "have not created jobs. Computers are designed, generally speaking, with one purpose in mind — to increase the profits of the corporation which use them — not to improve social welfare, not to increase employment and not to improve the working conditions of workers."

However, unions are becoming aware of computers' impact on jobs, he indicated. "The impact of computerization will be decided, more than anything else, by the strength and militancy of the working class," he added.

Session chairman Olaf Engberg, representing the Danish computer Society at Ifip, said the discussion proved that in many ways the old economic rules are no longer working and new rules and attitudes toward employment need to be developed.

In all, public debate on the issue of computers and employment is necessary, no matter how painful, Engberg concluded.



ON ANY TRACK WE'RE HARD TO BEAT

When you talk about leasing an IBM/370, you are on a fast track. Each leasing company claims it has the best program for you. But does it? With over $200 Million of IBM/370 equipment on lease in the U.S. and overseas, Alanthus' customers are saving more than $17 Million annually. That's a real winner!

Our leases are unmatched in flexibility. We can offer you a short operating lease, a long term financial lease, or even a revolving lease. Working with you, we can custom tailor the lease program to suit your needs. You win again!

But here's one to get you first past the post. Alanthus is offering to installed 370/158 and 370/168 users, operating leases of 1, 2, 3, and 4 year terms.

Our lease documentation is easily read and understood. It consists of only four pages plus an equipment schedule. Another winner!

Call the people from Alanthus.
We have the lease program that's best for you.
We're winners on any track.

Panel of Experts Finds

'Social Accountability of DP' Difficult to Define

TORONTO — Just what is the "social accountability of computing?"

A panel made up of some of the world's experts on the subject grappled with that question at a session of the same title during the recent International Federation for Information Processing (Ifip) Congress 77 here, but it was unable to come to any clear resolution.

"We lack good theories to predict the interplay between computers and society," session organizer Dr. Bob Kling admitted.

But work has started in developing such theories, according to Kling, a faculty research associate with the Public Policy Research Organization of the University of California at Irvine. "I hope it's not too late," he added.

Computing is clearly becoming more widespread, he said, and computer scientists and others should ensure that its effects on society at large are benign.

So far the benefits of computing systems have accrued to those organizations able to apply them; the record of benefits to the public has been "spotty" at best, he said.

In fact, he indicated, the record so far shows there are "small but precise" benefits to the "elite" from computer use and "small problems " for others.

Five Models

There are five suggested models for handling the effects of computers and society, Kling pointed out.

The first is the free market aproach in which price and consumer demand are seen leading only to benign services.

In reality this does not always work out that way, Kling said, since the model assumes that there is a market with many buyers and sellers and that users can move easily from one system to another.

This model also assumes all the benefits and problems with systems are known in advance, which is not always the case, he noted.

The second model is the legislative one where laws are developed to control the unwanted effects of computerization.

The third is a regulatory model where regulatory bodies are established to monitor the effects and make computer systems accountable. The drawback here, he said, is that such bodies often become the subjects of the industry they are supposed to regulate and sometimes act to restrain trade.

Another model is that of professional control over the technology, with professionals setting up the rules for accountability. Unfortunately, Kling indicated, people in the computer business are hired employees who can assert little control over the ways in which the technology is applied.

The final method sometimes discussed for making technology accountable to society is that of citizen action, in which citizens can bring suit or political pressure against abuses in the use of computers.

Prof. Kelly Gotlieb of the University of Toronto said there are many conflicts in the area of social accountability of computing.

Areas that are close to resolution, he said, include that of data confidentiality and the one concerning the rights to intellectual property, such as copyrighted works, used in computer systems.

Those are primarily legal questions, he said, and are being dealt with on a legal basis. Other questions in the area of social accountability will not be as easy to resolve, he indicated.

For example, the conflicts between personal morality, organizational loyalty and professional ethics are a "searing issue" that will not go away, he said.

In addition, the problem of the profession's responsibility for influencing public opinion about issues concerning computer use is not one that will be easily solved, he said.

However, the most pressing issue concerning the interaction of computers and society is that of employment and the effect of computers on either creating or reducing employment opportunities, Gottlieb said.

Klaus Brunnstien, a West German computer scientist, said that to date the activities of the computer field that have affected society have been minor, but warned they will grow.

"Basic knowledge of our own area is crude," Brunnstien said, adding that knowledge of computer application areas and their effects is even less well understood by computer scientists.

The profession must admit to this lack of knowledge, he said.

The computer professional needs to have more of an attitude of responsibility toward the use of his systems, he indicated, calling for more discussion of codes of good conduct and a greater emphasis on social accountability within computer science curricula.

Today there is a generally positive view among the general public toward computer systems, but this could change, he warned, just as nuclear energy was originally greeted positively but has been coming under greater criticism as its effects become better known.

HOW TO
SELECT A
TP MONITOR

Be very critical and judge each product on the following criteria:

PERFORMANCE
EASE OF USE
DOCUMENTATION
PROVEN COMMAND LANGUAGE
PRICE
FULL MULTI-TASKING
FACILITIES
RECOVERY AFTER FAILURE
ON-LINE PROGRAMMING
UPWARD MOBILITY

RELIABILITY

Hobbyists Seen Setting Communication Trend

By Molly Upton
CW Staff

TORONTO – Man might do well to apply what he has learned about building computer and communications systems to the social structure as a whole, according to Paul Baron, president of Cabledata Associates in Palo Alto, Calif.

The former member of the Institute for the Future envisions a world in which interpersonal international communication is greatly increased – not through any intent of large corporations or governments, but by individuals' use of micro-based packet-switching networks.

In designing a packet-switching network, for instance, one of the key concerns was redundancy "to ensure robustness," he told a session on "Data Networks – Past, Present and Future" at the International Federation of Information Processing (Ifip) Congress 77 here.

This would eliminate dependence on one monolithic structure, such as now exists with the country's governmental decision-making in one location.

The people-to-people-type structure gives society a more stable organization that is more adaptive to change than a monolithic hierarchy, he said.

Pocketbook Prices

Much of the hardware will soon exist at pocketbook prices to facilitate the people-to-people communication Baron envisions, he said.

The five major components of such a person-to-person packet-switched net are the user's terminal, a local distribution system, a packet-switching node, long-distance transmission lines or satellites and a host computer, he said.

The microprocessor makes the hardware needed for a node affordable for a hobbyist. One group is writing software for a distributed network that uses telephone lines, he said, adding he expects low-cost terminals will soon be available.

These can be "bootlegged" by acoustic coupling onto phone lines, whose cost is reasonable if divided among a number of users.

Also, he thinks it is possible using small ground stations to "bootleg" or spread a spectrum on satellites without detection.

"We may be entering a new era in which a small group using its own funds can build the information and network processing systems of tomorrow," he suggested.

"Hobbyists are probably having a more profound effect on technology development than even the amateur radio enthusiasts did back in the early days of radio," Baron said.

Hobbyist software tends to be better written than commercial and the hobbyists trade software and work together well, he observed.

The basic stumbling block to increased interpersonal communication over national boundaries is government controls, he said.

Perhaps it's time to consider whether these controls of communications channels should be open to the individual, he said.

Replace Postal Mail

The availability of messages could replace postal mail at less cost, he indicated. Communication that occurs in hours rather than weeks is of a different type, he added.

Bypassing government controls on international communications might enable man to do more than all the government's efforts to assure stability and peace, he speculated.

Long-term world order will occur when the disparity between the wealth of nations disappears, he indicated.

And communications plays a part in the status quo, since more than half of the gross national products of developed nations are developed via the transmission and processing of information.

Packet networks have tremendous potential and could be more important than voice telephone connections in furthering international communication, Baron said.

For instance, those in the know are quiet about the fact that the major portion of traffic is messages interchanged by humans with a relatively simple intermediate computer processing. They are not, in fact, messages from machine to machine, he indicated.

This fact is not being flaunted in order to avoid "sticky regulatory" problems, he said.

A three-minute telephone call over voice-grade can transmit 7,000 pages of text, but old tariffs block such applications.

"Thus, those who transmit data at these bargain rates do not want to talk about their loophole. In the process, however, we are concealing a major evolutionary development – a breakthrough in low international communications costs for alphanumeric text," Baron said.

Meet to Cover Transnational Data

Special to CW

PARIS – The economic and social effects of data moving across national boundaries will be the subject of a major international symposium Sept. 20-23 in Vienna, Austria.

The Organization for Economic Cooperation and Development (OECD), with 24 member countries including the U.S., expects 250 representatives of government and private industry to hear 40 speakers present views on international computer communications networks.

OECD headquarters in Paris indicated the four-day program entitled "Symposium on Transborder Data Flows and Protection of Privacy," will concentrate on "the transnational dimensions of computer applications in terms of ensuring the security, integrity and privacy of data; the importance of maintaining the principle of free and continuous flow of information; and complex economic, social and legal problems arising from the transfer of such data.

The symposium is to be a forum for speakers from the U.S., Canada, Europe, Japan, Australia and New Zealand. They will represent different interests in transborder data communications, including manufacturing and commercial users of systems for internal management purposes; financial, banking and insurance organizations; and public administration agencies such as tax, police and social insurance authorities.

Also represented will be computer service bureaus operating internationally, data communications carriers and regulatory bodies and information and documentation service networks.

Most Immediate Issue

The most immediate and concrete issue of international interest, according to OECD, is the possible effect of emerging national privacy laws on multinational communications.

"Already some countries have indicated a preference for special restrictions on sensitive data which can be sent abroad [and some] intend to apply embargoes over transshipment of credit and other types of information," the organization reported.

U.S. participation is being organized by the State Department, which indicated 30 to 40 Americans will attend. Among the U.S. speakers will be John Richardson, director of the Office of Telecommunications, Department of Commerce; Phillip Onstad of Control Data Corp., representing the Association of Data Processing Service Organizations (Adapso) international committee; Prof. Alan Westin of Columbia University; Michael Keplinger of the National Commission on New Technological Uses of Copyright Works; and Carole Parsons, executive director of the Privacy Protection Study Commission.

Oswald Ganley, a deputy assistant secretary who is responsible for this U.S. involvement in OECD, recently discussed the issues before a congressional committee.

The issues, according to Ganley, are:

- Protection of the privacy of U.S. citizens whose personal data is transferred to other countries.
- Possible adverse effects on multinational corporations that would be forced to comply with different foreign data protection laws and regulations.
- Fear of nontariff barriers which might hinder or exclude U.S. firms in European markets.
- Retention of a free international flow of information, especially so scientific, commercial communications and cultural information will not be limited.

Avoidance of dislocations in commerce and industry is a prime objective of the OECD.

"Stringent regulations in some countries might lead to the creation of 'data havens;' that is, sanctuaries of data kept in more permissive countries.

"It may also be necessary to avoid unnecessary bureaucratic obstacles to transborder data movements and ensure fair competition practices," an OECD statement concluded.

GOOD NEWS!
HAZELTINE 2000's
ARE STILL ONLY $98/mo.*

Since its introduction in 1970, the Hazeltine 2000 terminal has set the standard for TTY-compatible terminals . . . with features such as buffered operating mode, formatting, tabulation, variable field transmission, cursor addressability, cassette and printer interfaces. And of course, like all Hazeltine computer terminals, the Hazeltine 2000 is backed by worldwide sales, service and technical support. Call for a demonstration today.

For Greater Productivity

DP Managers Urged Not to Resist Change

By Nancy French
CW Staff

TORONTO — As the DP manager strives for continuing productivity improvement, change is the essence of his work. The manager who cannot cope with change, who cannot plan for change, who cannot produce continuing change will not be effective.

This was the basic premise of a presentation by Mayford Roark of the Ford Motor Co. at the International Federation for Information Processing (Ifip) Congress 77 here recently.

Appearing as part of a program entitled "Future Directions in Information Management," Roark illustrated his point by mentioning some of the changes that have occurred during his 12 years at Ford.

For one thing, computing power has increased seven times, he said, while throughput has increased by a factor of 20.

Moreover, the company's industrial control systems, which consisted of about 400 small computers less than a year ago, have since been supplemented by 100 more.

Microprocessors, which have been in use for only three years at Ford, will have a greater impact within a decade on the company than any computer system existing today, he said.

Micros are not replacing old systems. They "have special functions for new and unreachable applications," he said. The old applications continue to grow at about 20% annually.

Explosion in Technology

This explosion in technology is in direct contrast to life only a few centuries ago, when skills once learned lasted generation after generation, or at least a lifetime.

In DP today, Roark said, many people have already "recycled" their working tools several times over.

Roark's approach to the management of change included 12 suggestions.

First, he said, system managers must be oriented to the prospects of change as something desirable — as a basis of improving productivity.

Systems should be viewed like cities — they grow, evolve and change as the needs change, he said.

Roark's second piece of advice was not to attempt too much in one step. "Such projects fail," he said, adding managers should break the long-term plan into a series of achievable projects.

Third, he urged session attendees, recognize that technology is based on group accomplishment. Even if it were practical to build one-man systems in data processing, they would not be particularly desirable since they are more subject to fraud or abuse, he noted.

The system designed by a group "may lack the genius that a single person's project might have, but people can use it and modify it with greater ease."

Flexible Modes of Organization

Fourth, Roark suggested adopting flexible modes of organization. Don't always set up project teams where the manager functions strictly as a supervisor; seek new organizational forms that keep pace with new organizational requirements, he recommended.

Fifth, beware of trying to solve difficult problems by increasing manpower, he warned. Brook's Law states that adding manpower during the late stages of an overdue software project will only delay its completion further because of the new responsibilities and work assignments the team members will be forced to accept.

Development Tools

Sixth, use development tools such as top-down design and structured programming to make systems easier to modify. Training in such programming productivity tools was one of the most useful educational programs Ford ever undertook, he said.

Seventh, think of systems as involving people as well as hardware and information flows. Systems should be created so the people who will use them have an incentive to do their jobs accurately, he said.

Eighth, look for secondary consequences of systems — both positive and negative, Roark urged. For example, a data base may end up having many additional useful functions, or a new management information system may create unforeseen organizational rivalries.

Ninth, seek productivity improvement within the systems function. During the '70s at Ford, the workload increased 20% annually, but the number of employees actually declined. The DP manager should aim at annual productivity increases of 10%, he said.

Learn to use tools of planning, and always be clear about the problem to be solved; concentrate on projects that can bring the most benefits, Roark recommended.

Be Clear

Finally, "be concerned about the manager as a key resource." Don't get swept away in an effort to prove omnipotence. The care and preservation of people involves creating an environment for growth as well as limiting abuse," he said.

How to stretch your DP dollars without getting bent out of shape.

Read our special report on *Stretching the DP Dollar* in the September 26th *Computerworld*.

Working within the tight budget constraints that exist in most DP departments can start with something simple — like a thorough management review of the reports you produce. A few might be outmoded or unnecessary, and these could be eliminated. Others could be produced less frequently; and the reports you rely upon most might be combined. All of which saves not only computer time, but end user, managerial time as well.

There are literally hundreds of other ways to save money and aggravation in your DP operation. And we'll have several experienced people on hand to tell us how they found ways to maximize efficiency in their installations in our September 26th special report. Edited by Frank Vaughan, *Stretching the DP Dollar* will be filled with informative stories like these:

- Making your computer a profit center through timesharing - an applications story.
- Trade-Offs of using a service bureau versus an in-house system — a tutorial.
- Lease or purchase? — Caveats and benefits.
- Designing a computer facility — how it's built is almost as important as what's in it.
- Saving money in a university DP environment — a case study.
- How a municipal government and a state agency cut costs by sharing a system — an applications story.
- Saving money on computer room forms — a survey of innovative methods.

If you're a DP Manager, financial specialist or executive with a flair for doing more with less expense, our September 26th special report will have valuable and interesting information for you. If you market a product or service that helps people save on data processing costs, you should advertise here. Ad closing date is September 9. Get the details from your *Computerworld* salesman. Or call Terry Williams at (617) 965-5800.

Erosion of Privacy by DP Avoidable: Panelists

By Molly Upton
CW Staff

TORONTO — Is the erosion of privacy an unavoidable consequence of computer applications?

Not necessarily — if timely controls are applied and if DPers address social issues rather than strictly technical ones, panelists from three continents agreed at an International Federation for Information Processing (Ifip) Congress 77 session whose title posed that question.

Rein Turn of TRW Systems, a consultant for the U.S. Privacy Protection Study Commission, said if the proliferation of recordkeeping continues to go unchecked, it is likely that undesirable effects regarding individuals' privacy will occur.

But, he added, the adverse effects could be caused by small, well-meaning decisions as well as by intentionally adversary decisions.

Citing driving forces behind the increase in recordkeeping, Turn said the real danger is that recordkeeping tends to be transparent to the data subject and it is therefore hard to realize that data gathering and storing on an individual is occurring.

The issue is one of control, and the laws must be dynamic to keep up with technology.

The potential for the erosion of privacy increases once the control lapses, Turn said.

"Erosion of privacy is not inevitable if controls are applied, but the potential for erosion is increasing," he warned.

Beneficent intentions can easily turn out to adversely affect privacy, he pointed out. "One can say that the computer is intrinsically innocent — just like the Saturday night handgun," he added.

Dr. F. Hondius of the Council of Europe addressed the issue of controls on data usage and asked, "How can we know about records without resorting to records of records, which smacks of Big Brother?"

He suggested that rather than looking to an independent arbiter in disputes, one should consider alternative forms, or self-control.

The Council of Europe is a body concerned with rulemaking among various countries of Western Europe and other Western nations over matters of mutual importance, such as data privacy.

Hondius recommended strongly that privacy legislation be enacted simultaneously at both national and international levels.

Individual Controls

A. Goldsworthy, past president of the Australian Computer Society, stressed the individual must be given practical and enforceable controls over his personal data.

Privacy is a part of human rights, he said, and therefore must not be eroded. There will be an erosion of privacy if DPers address technical issues to the almost complete exlusion of social ones, such as privacy, he warned.

To provide the individual with some means of preserving his privacy, Goldsworthy suggested a list of rights — to know who keeps records; to have reasonable access to records; to challenge and correct data; to be notified of changes; to designate by whom and for what purpose the data should be used; to destroy the data; and to redress through law if damaged.

Persuasion Urged

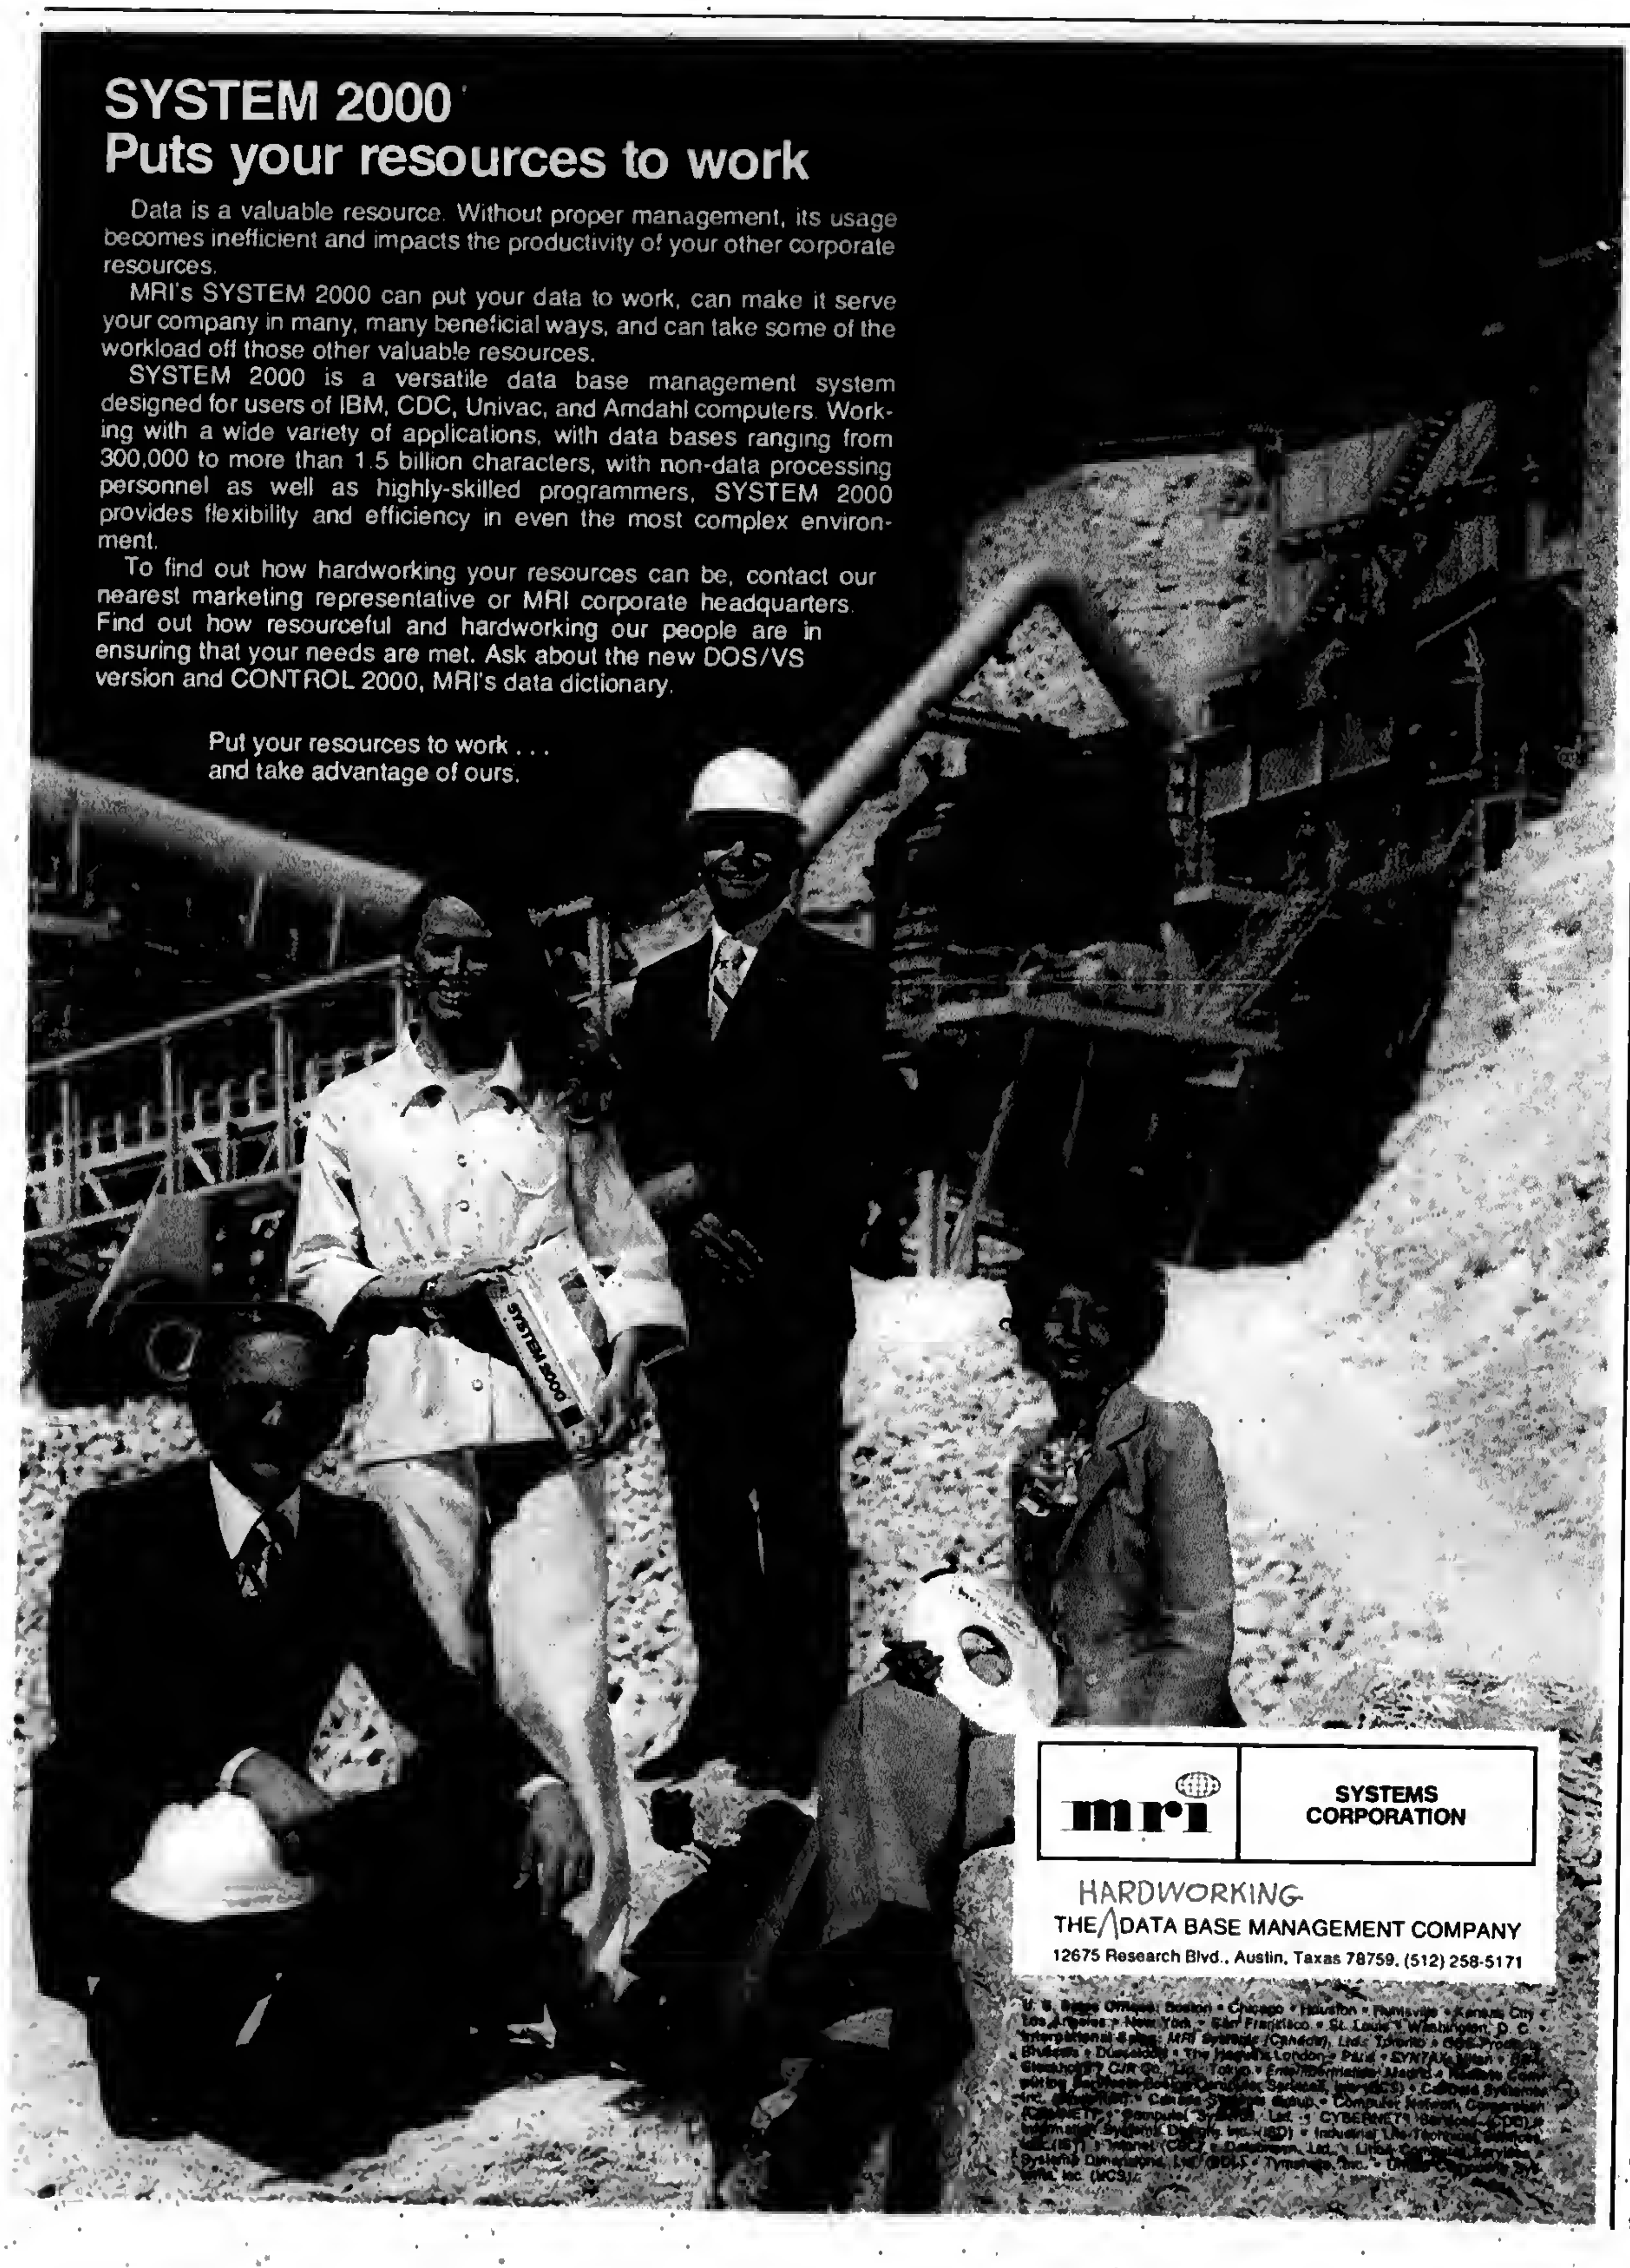
In implementing the controls available to the individual, Goldsworthy stressed universal solutions are not practical since what is regarded as private in one locality is considered public in another.

In certain circumstances, persuasion may be more effective than force, he said, indicating a privacy commission in New South Wales without enforcement power has been very effective.

Public and private sectors should be under the same control in order to guard against an organization saying it needs data for matters of national security, Goldsworthy said.

A balance needs to be struck between a government's concern to protect privacy and its willingness to give access, he continued.

An individual should not be allowed to determine what constitutes an invasion of privacy since he is a part of society as a whole, he stated.



SYSTEM 2000
Puts your resources to work

Data is a valuable resource. Without proper management, its usage becomes inefficient and impacts the productivity of your other corporate resources.

MRI's SYSTEM 2000 can put your data to work, can make it serve your company in many, many beneficial ways, and can take some of the workload off those other valuable resources.

SYSTEM 2000 is a versatile data base management system designed for users of IBM, CDC, Univac, and Amdahl computers. Working with a wide variety of applications, with data bases ranging from 300,000 to more than 1.5 billion characters, with non-data processing personnel as well as highly-skilled programmers, SYSTEM 2000 provides flexibility and efficiency in even the most complex environment.

To find out how hardworking your resources can be, contact our nearest marketing representative or MRI corporate headquarters. Find out how resourceful and hardworking our people are in ensuring that your needs are met. Ask about the new DOS/VS version and CONTROL 2000, MRI's data dictionary.

Put your resources to work . . .
and take advantage of ours.

Games Leading the Way

DP To Equalize Human Race by 21st Century

By Toni Wiseman
CW Staff

TORONTO — Spurred by increasingly sophisticated computer-based games, computers will begin to equalize the human race by the 21st century since the real differences between men today are based on access to knowledge and knowing how to apply it.

This prediction was made by Chris Evans, who heads the Man/Computer Interaction Group at the UK's National Physical Laboratory, at the recent International Federation for Information Processing (Ifip) Congress 77 here.

Evans explained, however, that these are long-term effects. Others effects, both trivial and significant, will begin to show their effects sooner.

Evans defined one earlier time period as being short-term — between 1977 and 1980 — and another as medium-term — 1981-1999.

Lure of Games

Throughout history there has been a trend toward diminishing work time and increasing leisure time. Theorizing that this trend will continue and even accelerate throughout the rest of this century, Evans said, it is important to investigate the pyschological factors which come into play as the amount of leisure time expands.

Significant developments between 1977 and 1980 will be led by the increasing lure of games. Evans suggested that the types of games available on computers, for instance, will be very compelling and their effect on human psychology may be significant.

Additionally, during this time frame the use of games as teaching aids will become widespread as pocket calculators appear with alphanumeric displays. Finally, there will be increasing amateur software development.

By the 1980's, there will be considerable interest in computer modeling for making decisions about one's own life. "The computer can certainly be more objective, so the individual may benefit in the end," Evans stated, noting that this type of development will have potent effects on society.

In the medium term, the quest for more sophisticated and elaborate games may well give some insight into the psychology of human thought and decision processes, he said, predicting as well that the computer will beat a grand master and become the chess champion of the world during this time.

The significance of this feat is a global, conceptual one, he said, since it will mark the first time there will be no question the computer is involved in an intellectual process and is good at it.

In addition, the first major impacts of computerization on labor and employment will begin to be felt and, as a result, there will be more concentration on what man should do with his spare time.

This will result in the first consideration, the first questioning, of the value of the work ethic, Evans predicted.

Significant Changes

No predictions on the nature of the trivial effects of computerization on society can be made for the long term; it is simply too far out, Evans said. But there are several significant changes which can be forecast.

One "eerie" effect will the the advent of the first "really good" artificial intelligence system, whcih may well be an exceptionally good companion, Evans said. Intellectual exchanges with such systems may prove to be very interesting, perhaps more interesting than with humans.

In addition, highly sophisticated games with enormous simulation properties may make people more introverted and cut down on the amount of travel they do, he said, noting the effect this could have on the world's economy.

The need for social contact may well lessen, Evans suggested, citing documented cases in which health authorities have found the students who interact for long periods with computers were more strongly oriented to the machines than to people and had psychological problems.

At this point in time, major decision making on personal and social problems may be done on computers. In fact, it may be "the only way to go," he said. The psychosocial consequences will be enormous, he pointed out.

Finally, present political systems, which are based in the past, will be unlikely to survive in the world of that day, he said. They will simply not be able to adjust to the rapid rate of change.

Two things are likely to arise in the future, Evans said. First, man will no longer be diverted by the need to work; working will no longer be "the real thing."

Secondly, as a result of the first, man will be forced to start looking at the nature of the human mind and at the nature of the universe, both of which he currently knows little about.

"This all sounds optimistic," Evans admitted, but "it may be that knowing too much about the universe and ourselves is not desirable. It will definitely be a shock, and not necessarily a pleasant or good one."

**Our new Model 77:
a batch terminal plus data entry
at a batch terminal price.**

Batch with a bonus.

From Data 100 comes a new way to deflate inflation:

Our Model 77 Communication System.

It's a full featured batch terminal that performs standard 3780 remote job entry functions, *plus* key-to-disk data entry functions.

Yet, you pay no more than you pay for a batch terminal alone.

Specifically, Model 77 is designed for users requiring batch communications and data entry capability with relatively small entry volume and small to large output volume. It offers:

A low cost system for first time or experienced data entry and RJE users.

True concurrent batch communication and data entry operations.

A full range of peripheral equipment for modular system growth. And other important features.

For more information, phone one of the numbers listed below or your nearest Data 100 sales office.

Find out how our new Model 77 can save you money, too.

DP Ombudsman Tackling Consumer Gripes

By Nancy French
CW Staff

TORONTO – The Canadian Information Processing Society (Cips) is operating an ombudsman service here and in Vancouver to help consumers deal with problems arising from their relations with computers.

James H. Finch, who serves as the Toronto-area ombudsman, said the service was established to serve as a back-line resource for the many other ombudsman-type organizations that already exist, rather than to usurp their authority.

The idea was born in Vancouver two-and-a-half years ago when Ted Sterling, a Cips member who heads the Computer Science Department at Simon Fraser University, joined forces with the Consumers Association of Canada and volunteer caseworkers recrutied from the school. This three-part team was aimed at helping business and government DP departments.

The ombudsman tackles a consumer's problem only after the consumer already tried to solve it himself and failed, Finch said.

The Toronto service was established in February. Business for Finch and his 14 volunteers was "pretty slow" for the first two months because the news of the service "wasn't getting to the man on the street," he explained.

Now, however, the ombudsman has handled about 18 cases, many of which were resolved in less than an afternoon, he said.

One case resolved recently involved a firm that couldn't seem to get its tax refund from the Department of National Revenue (comparable to the U.S. Internal Revenue Service).

The case had "ping-ponged between the regional and national offices, Finch said, and his group expedited the thing through the DP department, quickly resolving the problem.

Finch said DP departments are frequently "embarrassed into making the changes. We're actually commissioned on behalf of the DP community to perform this service."

As a by-product to solving individuals' problems, Finch's group hopes to provide feedback to industry on what some of the typical problems are and to eliminate them at the source.

As for why companies allow consumers' problems to occur and then go on so long without being resolved, Finch said many of the companies' DP departments are "too busy on programming. They don't spend time on the user interface. Further, the systems are biased toward the provider of the system rather than the customers."

Still another reason, according to Finch, is that programs are not properly debugged. Because of costs, many DP departments are prepared to live with a few problems, he added.

The Canadian program is different from the ombudsman program established by the Association for Computing Machinery in the United States in 1971, according to Dahl Gerberick.

Call for Papers

1978 INSTITUTE OF ELECTRICAL AND ELECTRONICS ENGINEERS (IEEE) REGION FIVE ANNUAL CONFERENCE, Tulsa, Ok., April 16-18, 1978.

The theme of the conference is 'Energy '78.' Topics will include new energy sources, energy conservation, control and instrumentation of energy systems, energy transmission and transportation systems, energy storage, economics of energy systems and alternatives, efficient utilization of energy resources.

Three copies of 200-word abstracts should be sent by Nov. 1 to Dr. R. Ramakumar, Technical Program Chairman, School of Electrical Engineering, 202 Engineering South, Oklahoma State University, Stillwater, Ok. 74074.

EIGHTH CONFERENCE ON COMPUTER AUDIT, CONTROL AND SECURITY, New York City, April 10-13, 1978.

Papers are requested on any aspect of DP audit, control and security, particularly how-to papers, case histories and accounts of personal experiences with advanced systems. Papers outlining the development of new techniques or modifications of old ones or providing insight into problems facing computer audit, control and security professionals are also being sought.

A one-page abstract, along with a brief personal resume, should be sent by Nov. 1 to Harold Weiss, Program Chairmen, Automation Training Center, Inc., No. 17, 11250 Roger Bacon Drive, Reston, Va. 22090.

PERCOMP '78, Long Beach, Calif., April 28-30, 1978.

The show is designed with the home computerist and business person in mind. Technical papers are encouraged in the following areas: ham radio communications or computer and amateur radio, speech synthesis and recognition, pattern recognition, music generation, programmed learning applications, bit-slice architecture, real-time machine control, software tutorials and business applications.

Three copies of an abstract, in English, should be sent by Oct. 31 to James H. Lindwedel, Percomp '78, 1833 E. Seventeenth St., Ste. 108, Santa Ana, Calif. 62701.

NATIONAL MICROGRAPHICS ASSOCIATION'S 27TH ANNUAL CONFERENCE AND EXPOSITION, Boston, Mass., May 8-12, 1978.

Papers are requested in the areas of technology, fundamentals, implementation, applications and other special interest needs covering the broad field of micrographics and related information-processing fields.

Possible topics include source document preparation; readers/reader-printers and enlargers; retrieval devices; camera and duplicating; COM start-up/COM ongoing; COM graphics; computer-assisted retrieval; standards; privacy legislation and freedom of information; micrographic systems and design; service bureau and/or in-house; micropublishing; word processing and micrographics; non-impact printing and/or COM.

Abstracts, typed double-spaced and at least 250 words long, should be sent by Sept. 9 to R.H. Kinney, Micrographics '78, Program Review Committee, National Micrographics Association, 8728 Colesville Road, Silver Spring, Md. 20810.

1978 NATIONAL COMPUTER CONFERENCE, Anaheim, Calif., June 5-8, 1978.

Papers and session proposals are welcome. Emphasis will be on the following areas: applications — world resource planning, exploration and development with emphasis on energy; electronic funds transfer; office automation; image processing; artificial intelligence; special-purpose terminals and systems; design automation and graphics; computers as a component of end-user products; small business; manufacturing and process control; data entry; personal computing; and simulation.

In methodology and techniques, papers are invited on software tools and techniques, programming methodology, DP management and administration, performance measurements and evaluation and automatic programming.

In people and society, the emphasis will be on legislation and its impact, communications and regulatory policy, computing careers and education, privacy, security and computer abuse.

In systems, NCC will emphasize computer architecture, impact of new hardware technology, distributed systems, data networks and communications, data base management systems, programming and operating systems.

Short papers of 2,500 words and long papers of 5,000 words will be considered. Include six copies of the paper and six copies of a title page containing title, 150-word abstract, four to six key words descriptive of the content, author's affiliation, telephone number and mailing address.

Submissions should be sent by Oct. 21 to Dr. Leonard Y. Liu, NCC '78 Program Chairman, IBM Research Laboratory, K51/282, 5800 Cottle Road, San Jose, Calif. 95183, or to Dr. Sakti P. Ghosh, NCC '78 Program Vice-Chairman, IBM Research Laboratory K55/282, 5800 Cottle Road, San Jose, Calif. 95183.

Give us your best.
We can make them better!

Honeywell is offering seminars and consulting services on state-of-the-art computer applications.

No matter what kind of system you're using, your people can learn to use it better and more effectively.

We offer seminars on a variety of Systems Sciences – on subjects like distributed systems, security and privacy, data center management, communications and networking, project management, and structured programming.

Seminars are scheduled regularly in major cities. Or they can be presented at your place of business.

For complete details, use the coupon. The sooner the better. The state-of-the-art is changing fast.

```

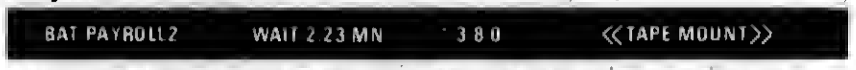
OMEGAMON displaying exception information and tasks with high cpu utilization.

How many of these problems do you have?

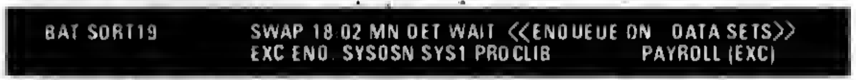
Tape Mounts?



```
BAT PAYROLL2        WAIT 2.23 MN       ' 3 8 0          <<TAPE MOUNT>>
```

Batch job PAYROLL2 waiting 2 minutes 23 seconds on a tape mount.

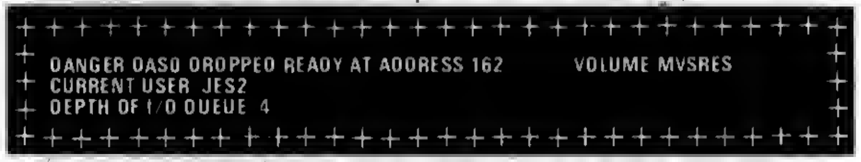
Enqueue Waits?



```
BAT SORT19          SWAP 18:02 MN OET WAIT  <<ENQUEUE ON   OATA SETS>>
                    EXC ENO. SYSOSN SYS1 PROCLIB           PAYROLL (EXC)
```

Batch job SORT19 swapped out (detected wait) for 18 minutes 2 seconds due to enquaue on data set SYS1.PROCLIB currently held by job PAYROLL.

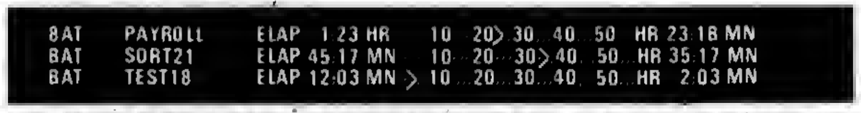
Dasd Dropped Ready?



```
+ + + + + + + + + + + + + + + + + + + + + + + + + + + + + + +
+                                                           +
+ OANGER OASO OROPPEO READY AT AOORESS 162     VOLUME MVSRES +
+ CURRENT USER  JES2                                        +
+ OEPTH OF I/O OUEUE  4                                     +
+ + + + + + + + + + + + + + + + + + + + + + + + + + + + + + +
```

Dropped ready exception indicatas addrass, volume, user and number of I/O's waiting on device.

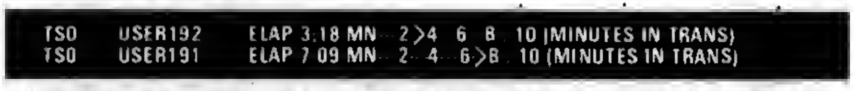
Initiators Tied Up?



```
8AT    PAYROLL    ELAP   1.23 HR     10  20> 30...40...50   HR 23:18 MN
BAT    SORT21     ELAP 45:17 MN      10--20--30> 40. 50...HR 35:17 MN
BAT    TEST18     ELAP 12:03 MN >  10...20...30...40. 50...HR   2:03 MN
```

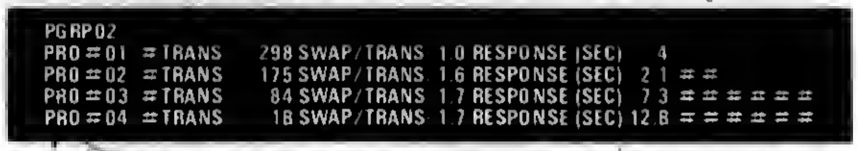
Elapsed time axception analysis tor batch jobs. Thresholds are assigned on a job class basis (1 hr for PAYROLL, 10 min. for SORT21 and TEST18). Elapsed time is on laft, "over-tima" on right, and plot ot over-time in betwaen.

TSO Response Time?



```
TSO     USER192     ELAP 3:18 MN -- 2 >4   6   8 . 10 (MINUTES IN TRANS)
TSO     USER191     ELAP 7 09 MN -- 2 - 4 -- 6 >8 . 10 (MINUTES IN TRANS)
```

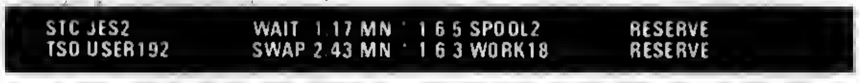
TSO rasponse time exception analysis. Time thresholds are assigned on a trensaction "period" basis.



```
PGRP02
PRO =01  =TRANS    298 SWAP/TRANS  1.0 RESPONSE (SEC)     4
PRO =02  =TRANS    175 SWAP/TRANS. 1.6 RESPONSE (SEC)   2 1 = =
PRO =03  =TRANS     84 SWAP/TRANS  1.7 RESPONSE (SEC)   7 3 = = = = = =
PRO =04  =TRANS     18 SWAP/TRANS  1.7 RESPONSE (SEC) 12.8 = = = = = =
```

TSO rasponsa time information by period number (ie. by complexity ot transaction.)

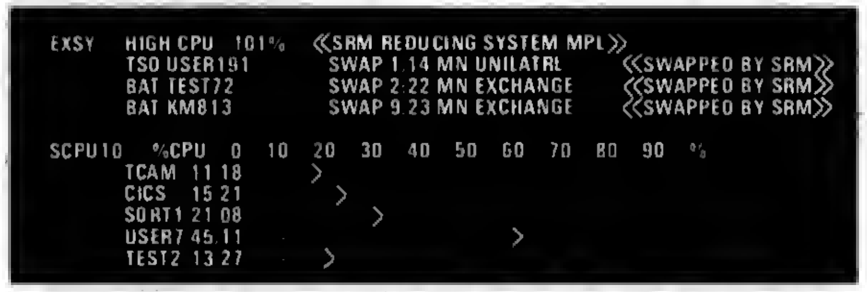
Reserve Lock-outs (Multi-system environment)?



```
STC JES2            WAIT  1.17 MN ' 1 6 5 SPOOL2         RESERVE
TSO USER192         SWAP 2.43 MN  ' 1 6 3 WORK18         RESERVE
```

In a multi-system anvironment with sharad dasd, RESERVE lock-out datection can be crucial. When running V=R and EXCP to a 3270, OMEGAMON requires no I/O to dasd davicas or control units and is not affected by console lockouts (WTO/WTOR).

SRM Swaps?

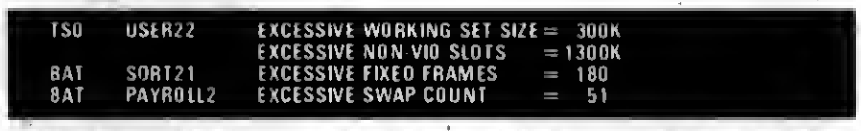


```
EXSY    HIGH CPU   101%    <<SRM REDUCING SYSTEM MPL>>
        TSO USER191          SWAP 1.14 MN UNILATRL          <<SWAPPEO BY SRM>>
        BAT TEST72           SWAP 2:22 MN EXCHANGE          <<SWAPPEO BY SRM>>
        BAT KM813            SWAP 9.23 MN EXCHANGE          <<SWAPPEO BY SRM>>

SCPU10    %CPU    0    10    20    30    40    50    60    70    80    90    %
        TCAM   11 18         >
        CICS   15 21            >
        SORT1 21 08                 >
        USER7 45.11                                  >
        TEST2  13 27          >
```

The high cpu utilization causas the systam resourcas manager to reduce the number ot active tasks (MPL) in tha system. As a result we see a TSO user having to wait tor 1 minuta while 2 batch initiators are frozen tor a total ot 11 minutes. The SCPU10 command salects any task using mora than 10% ot the cpu. (Nota TSO usar USER7 had 45.11% cpu utilizetion which indiractly caused the batch jobs to ba swapped out)

Storage Exceptions?



```
TSO     USER22      EXCESSIVE WORKING SET SIZE =  300K
                    EXCESSIVE NON-VIO SLOTS    = 1300K
BAT     SORT21      EXCESSIVE FIXEO FRAMES     =  180
8AT     PAYROLL2    EXCESSIVE SWAP COUNT       =   51
```

OMEGAMON exception anelysis for real and virtual storage and swapping.

OMEGAMON Features

- installation in 10 minutes
- dedicated 3270 or local TSO
- dynamic screen formatting
- PFK support
- logging capability
- over 200 commands to display information on address spaces, tapes, disks, channels, paging, swapping, real storage, auxiliary storage, page and swap data sets, SRM,,,,,

Need some illumination? To learn about our 6 months $1000.00 trial and how you can save $5000.00 on OMEGAMON (before Oct. 1) call or write now.

Inconsistent Data Seen Major Snag in Planning

By Molly Upton
CW Staff

TORONTO — The bane of corporate planners is inconsistent data garnered from various operating units, panelists indicated at a session on "Interactive Approaches to Corporate Planning and Control" at the recent International Federation of Information Processing (Ifip) Congress 77 here.

What is needed is a higher construct language that requires uniform data and allows planners to access information on such concepts as unit maintenance cost, according to Paul Strassmann, director of administration at Xerox Corp.

Amidst several supposedly happy users of APL, Strassmann said "APL as a planning language is dead, to overstate the case." In due course it will be dead, since it is hard to use as a "lingua franca."

He asked time-sharing vendors to diversify their syntax into other aggregate levels of expression as a means of moving toward the higher construct languages.

Strassman said he urges the people who invented APL to try to bridge the gap and take the discipline of data base management into the unstructured world of the planning organization.

He added he was addressing no one in particular, but the audience chortled since I.P. Sharp, one of the inventors of APL, was the chairman of the session.

It is necessary to reveal in an understandable manner the logic and the source of the data underlying the constructs, Strassmann added.

Distributed Function

Strassman envisions the data base management function being distributed into operating units. There will be more interdisciplinary use of the planning data, for instance, by marketing and manufacturing departments, he said.

While other panelists described their use of APL and praised its conciseness and interactive abilities, they did indicate they have trouble obtaining data from different operating units that is consistent.

Sharp, of I.P. Sharp Associates, Ltd., described corporate planning as applying exact methods to hopelessly inaccurate data. "But that adds to the fun," he remarked.

Morris Elliott, general research manager for Massey Ferguson Ltd., said the firm's organization along decentralized lines often makes it difficult to combine data from the different operating units.

Elliott's unit stresses giving practical, down-to-earth assistance to planners, he said.

In order to coax the operating units into collecting the desired data, Elliot's group in turn tries to provide them with systems that help in planning. "We can't expect the operating units to supply data if they can't use it themselves," he observed.

Massey Ferguson's system is easy to use for business analysts without programming knowledge, he said. It encourages the decision maker to experiment with the data, although he admitted it is not the executive but the business analyst that sits at the terminals.

The firm is starting to initiate a data base type of approach, he said. "By adopting a data base we hope to eliminate arguments over whose data is accurate," Elliott added.

Leo Kahn, head of the operations research department at the Nederlandsche Middenstandsbank in Amsterdam, said the bank uses simulation models, plugging in specific companies, to estimate such factors as credit worthiness.

John White, a planner in the Wellcome Foundation, Ltd., a drug company, said only simple and financial modeling has any place in real-life planning.

Planning systems must be along the lines of personal models that can be understood, he said. Although DP tends to err on the point of incomprehensibility, it can be timely, he admitted.

Wellcome converted to DP and APL in 1975. It wrote its own macro language that allows overseas companies to access its data, White said. The whole conversion was "done rapidly and cheaply and accepted readily by an organization very unsophisticated in DP use," he added.

Systems Consultant Contends

Distributed Processing Not Commercial Reality

By Nancy French
CW Staff

TORONTO — Although trade journals "laud the number of distributed processing systems available," from an information standpoint there are no commercially marketed products that actually provide for management of data structures at multiple sites, according to Kurt Ziegler Jr., a systems consultant with IBM in Gaithersburg, Md.

Speaking at a session entitled "Future Directions In Information Management" at the recent International Federation for Information Processing (Ifip) Congress 77 here, Ziegler told his audience that information systems control essentially four types of distribution: distributed functions, distributed systems, distributed processing and distributed data.

"Although many installations use some form of distributed systems, few vendors actually provide such facilities as part of their information systems offerings," he said.

Distributed processing is just now becoming a viable alternative to the single-host approach for distribution of data and processing, he said.

Distributed Functions

The only equipment currently available is that which distributes functions, Ziegler said. In this category he included intelligent terminals, which provide basic editing features, clusters, which provide source data editing and some simple status facilities; front-end processors, which provide transmission, conversion and routing facilities; and now "back-end processors," which provide data retrieval and output services.

As for "distribution of systems," Ziegler pointed out that large multinational corporations have had distributed systems for years — and that these systems aren't necessarily small ones, either. Here each installation typically has its own DP staff and specific business systems and appears as an "autonomous entity."

However, when it becomes necessary to exchange information between the users of the systems, it is done through a message-switching facility. This arrangement lets the user enter data at his terminal; the switch routes that information to the destination system.

Transactions requiring access to data at multiple sites can be accommodated via store-and-forward techniques, although these can present significant transmission time and volume overhead penalties as well as system recovery exposure, Ziegler warned.

An alternative approach to the store-and-forward distributed systems for multiple-locations data requests is distributed processing, he said. Here the front-end function must route not only by transaction type, but also by content, he explained.

The first execution point becomes the anchor point, he said. This application program isues transactions to other processors to access remote data; unlike the store-and-forward approach, the originating transaction does not terminate until all the transactions respond to the originating transaction.

The response then goes from the originating application program to the requestor.

Distributed processing appears to meet the goals of off-loading and availability, although it can dramatically affect response time while at the same time exposing the data base to some erroneous data, he explained.

Distributed Data

"Distribution of data" is the last variety of distribution Ziegler described. This, he said is the "easiest type to program," although it is "the most complex for the information system to support in terms of performance, control, recovery and synchronization," he said.

If the processors are geographically distributed, the same response exposure exists as for the distributed processing environment.

All figures based on latest available Datapro survey.

Here's why our users rate DATACOM/DC so high:

"In terms of total satisfaction, DATACOM/DC measured up completely to what we wanted and gave us more than we expected."
—David Hughes, Manager of Systems and Programming, Mass. State Lottery.

"When we installed DATACOM/DC, we experienced a 30% increase in throughput; more important, we eliminated downtime."
—Gary Dyer, Data Processing Director, Blue Cross of Idaho.

"DATACOM/DC was extremely easy to install and we had no TP experience."
—David Harp, Director of Data Processing, New Castle County, Del.

"My programmers say DATACOM/DC is very easy to use; as simple as writing a COBOL program. The documentation also is very good. Technical enough for the technical people yet simple enough for management people to understand."
—Harvey Kennedy, Vice President and Director of Management Systems, Southern Baptist Annuity Board (Dallas).

"Vendor technical support is Insyte's largest shining star. The support people are unparalleled in the industry."
—Ben Driver, Data Base/Data Communications Software Manager, Brockman On-Line Systems (Houston).

Experts Urge Simple Interface for Naive Users

By Toni Wiseman
CW Staff

TORONTO — Systems designed for use by "the naive user" should keep the complexity within the computer, not at the terminal, a panel of experts agreed here recently.

Unfortunately, that is easier said than done, attendees of the International Federation for Information Processing (Ifip) Congress 77 were told.

As you make the system appear simpler to the user, you inevitably make the software more complex, Don Bitzer, director of the University of Illinois' computer-based educational center, admitted.

Bitzer defined the "naive user" not just as one who is not knowledgeable in terms of DP, but also as anyone who is physically handicapped and therefore may not have acquired certain communication skills.

In fact, he said, even DP experts might be categorized as naive because they may know nothing of a particular computer-based system.

In outlining some of the criteria which have been used in the develoment of the Plato system, Bitzer emphasized the importance of keeping the target audience in mind, since most other criteria hinge on that point.

To be successful, communication with the user must be direct, he said. This means the computer must be able to communicate in a variety of ways.

Information must also appear to the user in a natural way.

The system must also be able to interact with the user at the conceptual level, he said.

Linguistic Issues

Sabina Rohlfs of Softlab GmbH, Germany, described some of the finer ponts behind the linguistic issues in communications with naive users.

She defined a naive user as anyone who has to use a computer to do a job in which he previously communicated with another human. This means the computer is simply a special-purpose machine and therefore needs instructions for use just as would be provided with a washing machine or a car.

Three Points

Rohlfs observed that the three main points in language design are to make the commands simple, provide explanations in short sentences and adjust the language to the specific target group. For instance, if asked a question such as "Do you suffer from headache or cold?", depending on his familiarity with the study of logic a user might interpret "or" as meaning "either or" or alternatively as meaning "both," she said.

Human-to-human communication includes both a content aspect and a relation aspect, she noted.

With a computer, the content is translated into a digital form with a syntax.

The relation aspect, however, is analog communication which has no clear syntax from which to draw a conclusion. She illustrated this point by noting tears could imply either joy or sorrow. "And there is no way to include this aspect of communication in a computer system," she told attendees.

Office Systems

Jim Bair, senior information scientist at Stanford Research Institute, examined some of the problems with office information systems, some solutions and some of the problems with the solutions.

The problems include the "incredible" spectrum of users with their variety of job types and organizations, the wide range of potential services desirable and the heavy usage imposed on a system if all services are available to all users.

Further Complication

The tremendous variety of hardware, software and networks available and the rapid change in people and technology further complicate the situation, he told Ifip attendees.

By way of solutions, Bair proposed one single language for all commands and communication. This language, he stated, should be a subset of natural language with one consistent syntax. This language should be used for both current and future systems, he stated.

DAA's
BRING BACK THOSE GOOD OL' DAA'S

Dear Ma:

You may be getting back some DAA's now that Vadic modems no longer need them.

A lot of folks will be moving out of your high rent district, Ma, now that Vadic is delivering direct connect 300 bps modems, the first to be registered under Part 68 of the new FCC rules.

It's an historic occasion, because modem users happily will no longer have to spend from $4 to $8 each month renting your Data Access Arrangements (DAA). Instead, the new Vadic 317S connects directly to the telephone network, using the FCC approved data jack.

For end-users, the VA317S is available, with Vadic's powerful displays and diagnostics, either in a stand-alone cabinet, or in the Multiple Data Set System where 16 modems (including built-In DAA's) take up just 7 inches of vertical rack space. OEM's can buy the VA317S packaged on a single PC board.

The VA317S is only the beginning, Ma. Before long, all Vadic dial-up modems will have built-in DAA's. Also, Vadic has designed a complete line of stand-alone, rack mount, and card form DAA's.

You can get the whole story, Ma, by phoning, or writing, to Vadic today.

Your independent thinking son,

Alexander Graham Jr.

PS: Vadic has shipped over 140,000 modems to date.

UK's Tricker Believes

Corporation's Structure, System Interdependent

By Molly Upton

Insert Here

TORONTO — Which comes first, the organizational structure or the information system?

The two are interdependent and, in fact, it is feasible to develop an organizational structure based on the design of the information system, Robert I. Tricker, director of the Oxford Centre for Management Studies, told a session at the recent International Federation for Information Processing (Ifip) Congress 77 here.

The issue is what kinds of interdependence ought to be developed, rather than which is dependent on the other, Tricker said.

The role of the information systems planner is therefore expanding to encompass influence on the corporate structure and, indirectly, possibly even on future society, he speculated.

Often there is a generation gap in management's conception of the role and potential of information systems, he told the session on "The Impact of Information Systems on Organizational Thinking."

"The changing role of management, from responding to environmental change to causing it, places a new dimension on the need for information in management decision," Tricker said.

"There are emerging pressures which identify information with power. And many existing information systems fail to respond to these contemporary needs.

"By thinking of management information as the outcome of human processes, looking beyond the technical and operational levels, the information system designer is contributing to the evolution of his organization to higher levels of coherence, connectedness and fruitfulness for all concerned. He may also be enabling it to survive," Tricker commented.

Data vs. Information

There is an important distinction between data and information; information "is a function of the user and his environment as well as of the data made available," Tricker stressed.

"We have probably not thought enough about the process by which data becomes information at the strategic decision-making levels," he continued. "In high-level decisions, information is not a commodity to be moved, stored and traded; it is, as [Norbert] Wiener said, what changes us, and change implies process."

Information "results from an idiosyncratic process of using data by individuals in specific circumstances," he explained.

The epitome of formulating information is the association of two previously unrelated planes of data in a resultant idea or concept, according to Tricker.

> *'The epitome of formulating information is the association of two previously unrelated planes of data in a resultant idea or concept.'*

Building on his thesis of the interdependence of the information system and organization, Tricker said, "Those of us involved in information system development are in the business of facilitating the process by which information is created."

One way to accomplish this would be to "increase the information potential — that is, to heighten the probability of two or more apparently unrelated planes of data being associated to trigger an information response in the recipient user."

This means "including the decision maker in the higher level information system. He is the information processor in the loop, supported by operational and technical-level data processing.

"The power of this interaction, with modern technology and comprehensive operating level support, has a high potential.

"This does not necessarily imply massive on-line support to the board room or executive desk. It does mean much closer interaction and the facilitation of search processes," he explained.

"But just as the information systems for management that have been developed to date have tended to concentrate on making data available, so management education has concentrated on the user, attempting to broaden his ability to identify his information needs and to obtain value from the data available to him. Perhaps the time is ripe to combine the two."

In the next stage of organizational evolution, the higher orders of organization "are those with the more coherently connected and interrelated parts."

Rather than being simply an increase in the number of communications channels, organizational intelligence may "simplify unnecessary complexity by concentrating on the development of coherent, related and fruitful systems at the technical and operational levels," he said.

"The job of the information systems planner operating at this level is to improve organizational intelligence by increasing the information potential and thereby enabling the organization to respond to environmental change and to cause it," Tricker said.

Participants in seminars at the Oxford Centre have indicated top management is concerned with information and power, he said. The three things expected to have the greatest impact on information system development in the next decade are internal organizational problems, involvement in the organization by third-party interests and external factors Tricker indicated.

"The new challenges faced by management in large organizations point toward new horizons for those responsible for information and control system developments in those organizations," he observed.

With the pressure for "industrial democracy" has come the increasing importance of information.

"Those with access to information and particularly those involved in its communication and supply can be on the cutting edge of social change. No longer is information the apparently free good available to economic man. It can be looked as a costly yet highly valuable resource," Tricker concluded.

Afips Publishes NCC Papers

MONTVALE, N.J. — The proceedings of the 1977 National Computer Conference held last June in Dallas have been published by the American Federation of Information Processing Societies (Afips).

The 1,000-page hardcover publication includes 132 original papers presented at the conference on such topics as data base administration, computer systems architecture, computer graphics and clinical applications of computers.

Microprocessor architectures, software management, computer hardware design, data structures, applications of computer networks and personal computing are also covered.

Copies of the proceedings are available for $60 each from the Afips Press at 210 Summit Ave., Montvale, N.J. 07645. Members of Afips constituent societies will receive a 50% discount if their orders are prepaid.

EASTERN-BASED COMPUTER FIRM SEEKS REPRESENTATION

from Data Center or Service Bureau on proprietary accounting system in West Coast, Chicago and Florida areas. Users' Report...

"Winning Proposal" Winning Big!

A step-by-step guide to proposal preparation entitled *How to Create a Winning Proposal* is helping computer/EDP marketeers score big wins in their proposal efforts. In a recent publisher's survey, users of the book reported an impressive 42% average increase in the success-ratio of their proposal projects during the past year. Of the users polled, 68% attributed their successful track-record to the guidelines provided in the book.

Dubbed "Winning Proposal" in marketing circles, *How to Create a Winning Proposal* is rapidly becoming the standard text for use in computer/EDP hardware, software and service company proposal efforts. The book covers the entire proposal process . . . giving detailed instructions on contents, structure and methods of preparation for both solicited and unsolicited proposals. Technical, cost and management section checklists are included to ensure the proposal team of covering all the important bases.

Government requirements are covered in an overview of the U.S. procurement network, how it works, and how the proposing firm can increase its "win probability" in competing for contracts. Excellent guidelines on how to analyze and respond to RFP's, RFQ's and IFB's are also included.

Copies are available pre-paid only from Mercury Communications, Inc. 730-CW Mission, Santa Cruz, CA 95060. $55 includes 3-5 day delivery inside USA. In Calif. add $3.12 tax.

what, me?
a fiduciary?

If you have any power of control, management or disposition of any of the assets of any employee benefit fund, or make decisions about its administration, you could be held to the strict standards of fiduciary responsibility. . .

If you think that your personnel system isn't giving you the support you need to minimize this responsibility, better ask Joe Nestor (617) 851-4111, Wang Laboratories, Inc., Lowell, MA about a new Wang software system for 360/370, Honeywell, and Burroughs, that will. . .

Outstanding Event

The effect of computers on employment. The social accountability of computing. Computers and leisure time activities. The effects of computers on job satisfaction.

There were sessions on all these important topics, plus more than 100 others dealing with every conceivable subject in the world of data processing, during the recent week-long Congress 77 held by the International Federation for Information Processing (Ifip) in Toronto.

The program was clearly the best ever in terms of content — and not only the best ever for Ifip, but also the best for any conference designed for people in the computer community.

Ifip, with its strong international spirit, draws from among the most thoughtful people in the DP field around the world. This was clear not only in the organized program, but also from the well-prepared audience questions and from the general discussions around the session areas and exhibit floor.

Of course, with only 9,000 attendees the show did not compare with the attendance at the National Computer Conference in the U.S., the French Sicoh or the German Systems 77. But in many ways a comparison in terms of numbers alone is unfair.

The other shows are primarily occasions for the industry to display — and sell — its equipment. They are made more palatable by technical sessions which range from the excellent to the mundane, but none match the intellectual stimulation and thoughtful discussions of Ifip.

Unfortunately, it will be another three years before the next Ifip show, and that one will be a long way from home for U.S. and European attendees. It will be held for one week in Tokyo and another week in Melbourne, Australia.

But for those who will be able to attend that show, it will be worth their while, even if it is just half as meaningful as the recent Toronto session.

Say Hello

A frequent theme of the recent Ifip show was the need for increased interpersonal communication among the people in the DP world and among the users of their wares.

This is a hopeful sign.

Admittedly, DPers may have taken a long and tortuous path toward the conclusion that what is important is not really data, but rather communication with others.

According to both prepared and impromptu remarks at Ifip, many DPers are now realizing the technology of computers and communication both on a national and international level.

But in the meantime don't forget that interpersonal communication can also be a very simple function performed without the aid of machines.

Say hello to your neighbor today.

Letters to the Editor

DOD's Software Spending

The Aug. 8 issue of Computer*world* contained an article ["PDP-11 Leading Choice for Military Standard"] mentioning the selection of the PDP-11 architecture as the leading candidate for the standard computer family architecture. In that article it was also mentioned that the Department of Defense [DOD] "spends $3 million on software development, according to figures from the Office of the Secretary of Defense."

Actually, I think the quoted $3 million was a typographical or transcription error. The real figure was closer to $3 *billion* in 1973.

Quoting from a paper on life-cycle cost modeling of computer family architectures that appeared in the 1977 National Computer Conference Proceedings: "D.A. Fisher ["ADP Costs in the Defense Department," Institute for Defense Analyses, Arlington, Va., October 1974] estimated in fiscal year 1973 DOD spent $6.2 billion to $8.2 billion on ADP. He found that approximately one-third of this amount originated in each service and that about 16% of the total went to computer hardware, 45% to software and 38% to other ADP costs, such as support and supplies, keypunching, and computer operation.

"Using these figures we deduced that $1 billion to $1.3 billion went to computer hardware and roughly $2.8 billion to $3.7 billion went to software."

John J. Cornyn

Wanted: Legal/DP Dialogue

In recognition of the frequent legal and ethical problems raised by Computer*world*'s articles and readers' letters, it might be of interest and mutual benefit to start another level of discussion.

I am presently chairing the Subsection on Computer Abuse, Science and Technology Section, American Bar Association. The members of this subsection have requested me to develop a dialogue with any organizations and/or individuals in DP who would be interested.

Object: mutual understanding of our two professions' problems in our inevitable relationship.

I can be reached at the District Attorney's Office, Planning Section, Alameda County Court House, Oakland, Calif. 94612.

Donald G. Ingraham
Senior Trial Deputy
District Attorney
Oakland, Calif.

SSN as Private Property

Although I agree with the need for storng privacy standards, I disagree with Steven Seltzer's letter and Computer*world*'s "Oops! We goofed" [CW, Aug. 8].

The rights of an individual to privacy are dramatically altered when his criminal acts destroy the rights of other members of society. The criminal was misusing the Social Security system. How else could CW alert possible victims to this misuse without publishing the "alias" Social Security numbers (SSN) the criminal used?

If the SSN is to be held in the same regard as private property (with respect to search and seizure), then let's require a court order for its use in criminal investigations, not ban it completely.

Abbott Fleur
New York, N.Y.

Data Past

Five Years Ago
Aug. 23, 1972

BOSTON — Virtual memory systems scored high marks in IBM 370/145 user tests. The Model 145 users who field-tested OS/VS1 found throughput equal to or better than what they were getting under OS/MFT, an IBM spokesman reported.

— — —

BOSTON — The founder of the Association for Computing Machinery (ACM) blasted the group for its failure to investigate whether computer applications are good or evil. The Special Interest Group on Computers and Society is "a sample of tokenism," Edmund C. Berkeley said at the association's 25th anniversary dinner here.

Eight Years Ago
Aug. 27, 1969

WASHINGTON, D.C. — The Court of Customs and Patent Appeals upheld the original decision made in the case of Prater and Wei that computer programs can be patented. But the decision did not uphold the claim for a patent on the software itself. The case involved patent claims made by Charles D. Prater and James Wei of Mobil Oil for a system of reducing errors in spectrographic analysis. The patent was originally rejected by the Patent Office on grounds it was a "mental process" and inherently unpatentable.

— — —

BOSTON — Separate pricing was the leading topic at the Share meeting held here. The question of whether members of the IBM users group would be willing to continue telling IBM what they needed if IBM turned around and sold the answers back was hotly debated. The undercurrent seemed to be in favor of splitting Share away from IBM and making it an independent users group, but there seemed to be an equally strong current toward continuing Share activities without change.

Where Are the Operations Success Stories?

By Jack Stone
Special to CW

The Human Connection

"And now will the *real* successful DP manager please stand up!"

This statement is not really intended to be a parody of a quote from a famous TV show. It is actually a serious request from this writer.

You see, I developed what I originally thought was a great idea for my next series of columns but, rather pathetically, it now appears doomed to failure. The concept of the sequence is that I visit a "successful" DP department and interview some of the people involved with the operation — a group consisting of, perhaps, a user manager, the senior non-DP executive, the DP manager, an operator, a systems programmer or whomever else might be interesting for the purposes intended.

The theory underlying the writing is, of course, that certain attributes of a successful installation may trigger ideas in the minds of readers that could help their own operations succeed.

My problem, ladies and gentlemen, is that I can't find a DP manager who is willing to stand up and claim a successful operation.

Now before you scoff and guffaw, let me talk more about the nature of my dilemma.

First, the categories of DP departments I've been looking at exclude those installations whose primary mission is not the processing of typical commercial-type production jobs, such as those devoted solely to development, since they are atypical.

Also excluded are scientific or engineering-oriented centers, since their users are generally (but not always) knowledgeable about their own needs, machine capabilities and systems design.

I did not include operations which are considered "small," in that the cost, DP head count, machine size or related factors are not of earth-shaking consequence to the organization. And, obviously, special-purpose machine systems are not considered.

I'm just referring to the typical DP department which is a separate entity, has its own staff of programmer/analysts and has its own machine operation with an IBM 370/145-class machine or larger. It processes a mixed bag of test and production jobs in the multiprocessing environment, has a reasonable level of cost/performance consciousness and services a host of non-DP-experienced users.

Now let me turn to a discussion of performance success. I accept the classic technical goals of efficiency, effectiveness and economy. But I believe there is another set of classic goals that must be met if technical performance is to be achieved. These are human performance goals.

Peering beneath the mechanistic cloak of "productivity" goals, I am referring to goals which pertain to human intellect, volition and affections. They include such notions as communications, motivation, loyalty, judgment, receptivity to change, energy, risk-taking, attitude, decision-making, analytical ability, leadership, integrity, purpose, desire for success and inspiration.

It may never make the textbooks, but I'll propose Jack Stone's Theorem on DP Management anyway. It states: "In general, the technical performance goals of the information systems function are achievable only when human performance goals are developed in humanistic terms and resources are applied toward their attainment."

I submit that my difficulty in finding a successful center strongly suggests the validity of my theorem because of the well-know disinterest in humanistic values, but does not constitute irrefutable proof.

As further testimony, let me relate just a few of the recent experiences I have had that illustrate rather elementary, yet devastating, applications (or lack of application) of the theorem:

- On user relations: During a lecture I gave to over 100 DP professionals, I asked, "How many of you believe the user's guide for your computer center properly or reasonably reflects the range of services, operating procedures and special guidelines for use of the center facilities?" Three hands.
- On management development: I purchased three new entries for my library of DP management textbooks. All three authors stated that human communications and interpersonal relations were very important but beyond the scope of their respective texts.
- On programmer/analyst managment: I met a person at NCC '77 who functions as a second-level programming/analyst manager and expressed interest in joining me for some writing projects. As we chatted, I concluded that I might finally have found my "successful" installation, since she revealed a great story of excellence in DP management. Sadly, though, I had to disqualify her installation as a candidate for my success story because it is heavily science-oriented. Much more distressing was that she could not refer me to any other prospect.
- On operations personnel: I received a frantic call from a prominent installation which was in the process of upgrading from a uniprocessor to a multiprocessor configuration. In spite of the untold number of dollars and man-hours involved in the conversion, it had neglected to plan for an effective

Data Evacuation Can Save DP in Blackout

The Taylor Report

By Alan Taylor CDP

Blackouts like the one that hit New York City last month will hopefully never be so frequent that computer operators and analysts have to face them as daily occurrences. Because of their infrequency, they are treated as matters for contingency planning.

However, contingency plans often lack one important consideration — they take for granted that the world outside the computer room is operating normally. As the New York situation showed, however, there can be times when elevators don't run, the air conditioning stops and cars go only as far as their gas tanks will allow.

And yet, with increasing world complexity and increasing world shortages, it seems only prudent to see if DP operations can be safeguarded in an economic manner. This column suggests one possible method based upon the situation in New York, where the telephone communications systems continued running when the power went down.

The basic method is simply to evacuate the computer data via telephone and satellite to anywhere else in the world where preplanned, modified operations can continue to serve the area affected by the blackout. When the blackout is lifted, the process can be reversed.

The emergency mode in both the communications network and in the computer room would have to be initiated by some form of disaster signal. In the best form, such a signal could be an early warning signal, a sort of "Condition Yellow" sent out by the power company on a special network.

In other cases, when there is no time for a warning, the evacuation period could well have to be cut to five minutes, or even less.

The communications lines would have to verify the receipt and correctness of data at the remote site. This could not wait until the remote computer starts trying to operate on it; by then it might be too late to ask for part of a program to be retransmitted.

This appears to suggest the emergency communications network should be, at least in part, based upon packet switching so each packet of data being shot to safety would be checked for accuracy within a second of leaving the site and then maintained within the network in accurate form.

It would not appear to be necessary to send out all the data in the data center. The center would only have to send:

- Contingency alert instructions to

(Continued on Page 20)

Will Method Work?

This week's Taylor Report suggests a combination of power company and telephone company services could maintain essential DP operations by evacuating the data to a remote site during an emergency and then returning it later. Some of the essential points are listed here for your review.

1. Special telephone communications would carry warnings of power drops.
Would this work? Yes___ No___
Comment: ______________________________
____
Alternative: ______________________________
____

2. Special broadband equipment would be installed at the DP site to transmit files and programs during the contingency emergency.
Would this work? Yes___ No___
Comment: ______________________________
____
Alternative: ______________________________
____

3. The network would be a self-verifying one with data storage facilities and host computer connections to restart contingency programs, hopefully with switched phone numbers.
Would this work? Yes___ No___

NOW...
THE #1
SORT SYSTEM
SAVES YOU
EVEN MORE
TIME!

Yes, thanks to a decade of enhancement, refinement, and fine-tuning, the new CA-SORT 77 is a full 15% more efficient!

Consider your own IBM 360/370 OS, DOS or VS system. What would happen to your efficiency and throughput if you could save up to 50% on disk work space?

Would you be a happier DP Manager if your elapsed time was slashed an average of 20% or more on every sort run?

And -- save 25% on CPU time!
Plus -- save up to 50% on I/O activity.

At the same time you save valuable core space two ways ... through planned sort module sizes and dynamic core management!

THAT'S JUST A STARTING GLIMPSE OF CA-SORT 77 -- THE MIRACLE SORT SYSTEM FROM COMPUTER ASSOCIATES!

If you measure the sort activity in your installation you'll find that sorting represents from 10 to 70% of all your DP activity!

When you make your sort function faster, you have to become more productive. The only question is how much more productive. There's a quick and easy way to find out for yourself.

•And that way is to simply install CA-SORT 77 without cost or obligation. Run it for 15 days and judge for yourself!

•There's nothing complicated about installing CA-SORT 77. It takes about 10 minutes and there are NO JCL CHANGES! There is no disruption of your normal productivity, you don't have to waste weekend time.

•You won't need artifical benchmarks or contrived environments to help you measure the results. You start saving on the very first sort run.

HERE'S WHAT TO DO NEXT -- TO START START SAVING AS SOON AS POSSIBLE!

Simply tear off and mail the card below. You'll get a complete Information Kit about CA-SORT including the easy details of the 15-day FREE trial. There's no obligation of any kind ... just an opportunity. Mail the card now while you're thinking about it!

COMPUTER ASSOCIATES

Safe Technology Needs Attention

By Donn B. Parker
Special to CW

As computers expand into sensitive functions in organizations throughout society, the need to assure safety from all kinds of dangers and losses in the use of computers becomes increasingly critical.

Concern over the threat of intentionally caused losses and abuses can be seen in recent articles in the Aug. 1 *Business Week* and Aug. 8 *Time* magazine, as well as in Sen. Abraham Ribicoff's Committee on Government Affairs in the U.S. Senate, which recently produced two reports on computer-related crime and is proposing criminal law on the subject [CW, July 4].

During the past seven years, I have had the unique privilege of working toward the goal of safer use of computers on a full-time basis as a consultant and researcher at SRI International, a not-for-profit research and problem-solving institute. SRI has strongly supported this work, and several private and federal clients, principally the National Science Foundation (NSF), have funded the efforts on a limited, often a no-fee or no-profit, basis.

Ethics and computer abuse are important subjects of this work at SRI. These two subjects are also of high interest in the public media.

Codes of Ethics

Codes of ethics have been of great benefit to society in other professions, including law, medicine, accounting and engineering. Critics of codes of ethics have an easy time of it. Their arguments are usually based on the logic that the exceptions, no matter how few, prove the codes' ineffectiveness.

Such "proof" is not hard to find because, in any profession with a code, each wrongdoing violates that code, and violations have great visibility.

On the other hand, little can be measured and very little is heard about the many positive results produced by codes of ethics. Through the good work of dedicated Association for Computing Machinery members, a code of ethics has been develolped, and a procedure for invoking sanctions is now being seriously considered. The Data Processing Management Association and other professional societies are also making headway in this area of responsibility.

About two years ago I reached the conclusion that a code of ethics, even with sanctions, would have little vitality unless the people concerned with computers were alert and sensitive to the ethical aspects of situations which arise and which they encounter in the course of their work. What was needed was a widespread interest and discussion within the computer field about specific ethical issues and about what is ethical and what is unethical.

A modest NSF grant was awarded to SRI to carry out a project on ethics in computer science and technology. That project is using an experimental methodology to make personal ethical issues amenable to explicit debate and opinion and ultimately to facilitate generalization in the expression of possible principles.

To accomplish this objective, 62 scenarios that raise ethical questions were presented for discussion at a national invitational workshop held in March. It was sponsored by American Federation of Information Processing Societies (Afips) and attended by people who were recommended by the presidents of the Afips constituent societies and persons known to have written on the subject of ethics. It included a range of people from the computer field, ethical philosophers and lawyers.

The final report on the project, to be published by the Afips Press, will consist primarily of the half-page scenarios, each followed by the votes of the participants on whether there were ethical violations, their opinions on the specific cases and a statement of any general principles that the scenarios might have suggested.

A recent article and request for reader response to two ethical scenarios in *Computerworld* [CW, March 21] indicate the great interest in and effectiveness of this scenarios technique. The reader responses were reported in the April 11 issue, and at that time over 350 respondents had submitted their opinions of the scenarios.

The importance of developing sensitivity, awareness, interest and dedication to ethics in the computer field can easily be seen from the results of the study of computer abuse that has been going on at SRI for almost seven years. It is funded primarily by grants from NSF at a two-person level of effort.

The study does not deal exclusively with fraud, theft, larceny, embezzlement, sabotage, espionage or extortion. It deals with all kinds of intentionally caused losses and abuses where they can be historically studied to produce information of value in helping potential victims protect themselves from similar experiences.

The file of reported cases represents a small, highly biased sample of loss experience; a number of the cases are reported only in the form of brief newspaper clippings. Many others are documented in great detail. The more valuable cases are being investigated in-depth and more information is being collected.

The needs for a safe technology require our attention. We should all be supporting the endeavors to meet those needs.

—Parker is senior management systems consultant at SRI Inernational in Menlo Park, Calif.

Evacuation Saves DP

(Continued from Page 19)

terminals.

- Minimum response, store and return programs to the emergency center.
- Minimum response files to the emergency center.

Preferably, the communications lines to the original data center would be switched to the emergency center when it is established (and that would be part of the communications operation). This is not too difficult using microcomputer systems for the switching operation — if the requirement has once been programmed in.

Naturally, all of this has to be financed somehow. There appear to be two means of financing it — one through private enterprise, the second through state control functions.

In the private enterprise operation, the telephone companies and perhaps the power company would offer it as a service; certain charges for equipment maintenance would be made when no blackout occurs and appropriate fees charged for services during blackouts.

The problem with this idea, however, is that communications companies and power companies are basically noncompetitive, so there is little incentive for them to offer such a service.

Under the state control functions, the provision of such computer evacuation and restart facilities would be mandated as a requirement of any communications facility in computer times.

So that is one system I see for averting big or little dangers to computerized operations from power failures. Doubtless there are errors here: perhaps other ideas would be better and more economical.

Here is a questionnaire for your suggestions on how to save computer operations from potential power disasters. You can use it for reviewing my ideas, but hopefully you will also use it to suggest your own solutions.

Success Stories Sought

(Continued from Page 19)

operator training program and its operations function was in a wretched mess.

So here's my appeal. If you believe your installation is a success story and your category is proper, and you wish to tell the computer world about it via my series, send a letter of justification to me in the Editorial Department, *Computerworld*, 797 Washington St., Newton, Mass. 02160.

Try to keep the letter to under 500 words and include an OK to use your and your firm's names plus an invitation from a person in authority for my interviews (to be conducted at my own expense). Each entry will receive a complete set of my CW articles.

I really don't think I'll get one qualifying candidate. I truly believe Stone's Theorem is a universal DP truth as yet undiscovered by the world of DP management.

But 'Teams Don't Just Happen'

Team Programming Urged for Reliability

By Esther Surden
CW Staff

DALLAS — It is presently possible to implement a software system that has not been reviewed by anyone beside the programmer and "this is causing a lot of difficulties," according to Donald C. Gause, president of Ethnotech, Inc.

To remedy this situation, Gause recommended team programming techniques, which he said can provide improvements in reliability on the order of three times that of traditional programming.

To implement a team approach, a firm should know the talents available for the project. "Most of us don't really know who we have working for us," Gause told a recent conference here. "We wrongly estimate our people and there is no good yardstick to measure productivity."

In some cases, a person inadequate for the job is appointed chief programmer; in others, a person more adequate than the chief programmer is apointed backup for the chief, he said.

'Self-Organizing' Concept

In order to combat these problems, Gause suggested that users adopt a "self-organizing team concept" if roles are given. An open team in which no roles are assigned, however, will "encourage open inspection of work by team members," he said.

"Never let a problem become undefined," Gause urged. "Don't put effort into the management of unknown activities."

Many programmers don't know what is being built and there is no reliable measure of the percent of code that has been compiled. But something can be done about this situation if — before programming ever gets started — the team goes into the design phase with target dates, functional boundaries and formal reviews defined.

Using this procedure, the team can come closer to knowing what is to be done, he indicated.

"Teams don't just happen," Gause warned those thinking of trying the technique. Management has to invest in team building because a team that works well together can be productive and is in a good position to define its own difficulties, he said.

Users establishing a new team should try to create some experience-sharing opportunities on a social level to facilitate the rapport between members, he suggested. Successful teams should always be kept intact.

One problem faced by programmers trying a team approach is that management may not understand the concept. Management may see the team as not being on schedule for example, and try to add more people to the team.

This, however slows down the team because of the added burden of extra social interaction combined with heavier communications requirements, Gause stated.

Another problem is that sometimes one team member is burdened with too many roles, he said. Five members is the logical limitation of such an organization. This number allows diversity, but is small enough that the programmers will not splinter off into subgroups, he explained.

Adequate time also has to be allowed for learning, Gause said. Many feel that learning can be separated from performing the task, but with this attitude "we are missing the golden opportunity to provide a learning experience within the project itself," he cautioned.

The team can do something about reducing the unknowns in the programming effort, for example, by keeping a log of unknowns "by asking what you really don't know about the project." A top-down design strategy can also help, he said.

Accounting Modules Offered For Distributors on BSP 'Syfa'

IRVINE, Calif. — The Business Systems Applications Programs (BSAP) package recently introduced by Business Systems Products, Inc. (BSP) for use with its Advisor small business system is said to consist of nine fully integrated accounting modules for distributors.

The Advisor "really is the Computer Automation, Inc. Syfa system, with a different label," a BSP spokesman said.

The modules currently available under BSAP include basic file maintenance support, one- and two-step billing, order processing and credit/debit memo processing, he said.

Accounts receivable, inventory control, purchase order processing; sales analysis and end-of-day processing are also part of the package, he added.

The interactive on-line nature of the software sets it apart from the modules offered by some of BSP's competitors, the spokesman contended. He pointed to order point and credit limit warnings, issued as soon as a problem is sensed, as examples of BSAP's capabilities.

Each of the BSAP modules support all subsets and can be integrated with the other modules. The package can also be enhanced to complete the financial portions of manufacturing as well as other applications, the spokesman said.

The software, developed by Software Concepts, Inc. also of Irvine, and the Advisor hardware is suitable for small and medium-sized businesses with 10 to 500 employees and annual sales ranging from $500,000 to $50 million, BSP said.

The BSAP package is available for about $5,000, including 150 hours of training, the company said from 2121 Campus Drive, Irvine, Calif. 92715.

IBM Links Update 'Quikjob III'

DAYTON, Ohio — A variety of enhancements and a superset version of Quikjob III, a report writer system, are now available from System Support Software, Inc. (SSS).

The updates include optional interfaces with IBM's IMS and DL/I data base systems and full-function Vsam support for Quikjob work, the vendor said.

Meanwhile, Quikwrite, an information retrieval, processing and reporting system, now supports both Quikjob coding and a CALL facility to IMS, Cincom System's Total, Software AG's Adabas and other data base management systems, according to a spokesman.

The DOS-oriented QuikDLI interface was introduced earlier this year. The OS-based QuikIMS will be available Sept. 1. Either of these interfaces can be leased for $35/mo.

The Vsam support was made available to DOS users in March and April. Distribution of this facility will be made to OS-oriented Quikjob users this month and next. There is no extra charge for QuikVsam.

Report formats under Quikwrite are typically "autogenerated," but can be controlled by the user, he said. The system produces Quikjob III source code which can be stored and, if desired, refined to accomplish tasks not within the scope of a typical generalized report writer, he claimed.

The DOS version of Quikwrite is presently available; the OS version is expected to be available about Nov. 1. Current Quikjob III rental customers can acquire Quikwrite for $197/mo on a lease/purchase plan, the spokesman said from 5230 Springboro Pike, Dayton, Ohio 45439.

College's Data Base Aids Gas, Oil Field Studies

By Esther Surden
CW Staff

DALLAS — With energy a national concern, the University of Oklahoma has developed a data base of petroleum-related information that is available to users over the General Electric time-sharing network, according to Patricia A. Tracy of the university.

The Petroleum Data System (PDS) consists of information on over 75,000 gas and oil fields in the U.S. and Canada.

Sources for the information include annual state reports, the International Oil Scouts Association and state geologists. In addition, information from the Federal Energy Administration, Federal Power Commission, Energy Research and Development Administration and the Bureau of the Mines is included in the data base.

The identification of a particular field by name and reservoir, location as well as production data and geologic information such as age of the formation is handled by the system, Tracy said here recently.

The system is used for exploration project evaluation studies, property evaluation studies, pipeline research and feasibility studies, she noted. "Oil companies use the data base to get the information necessary to complete government questionnaires," she added.

The university chose to use existing software systems to quickly implement the network-based data base. "The use of existing software has freed the university of many problems in program design and implementation" and also helped reduce implementation costs, she said.

"Using developed software has been a distinct advantage for us," she continued.

The packages chosen include a "sophisticated storage and retrieval system called Gipsy General Information Processing System developed at the University of Oklahoma. Gipsy is used on either an IBM 360 or 370 series and operates under OS. "It is an excellent system for management of large data bases," Tracy told the group.

The system is very flexible, she noted, and since the PDS must be continually updated, flexibility is key.

The school is also frequently restructuring files, she added.

For example, "we are currently adding the latitude and longitude of the centerpoints of the fields to the records in PDS," she said. All that has to be done is to add a new definition to the data dictionary, so no special reprogrammng is necessary, Tracy noted.

Gipsy has its own retrieval language that Tracy called a "user-oriented retrieval method."

Prior to the PDS being put on the GE network, the university tried to implement the system on its own in-house system. This was "somewhat of a farce because it didn't take much response from the industry to overwhelm the system," she related.

Now PDS resides on the GE remote-batch system. The university has developed an interface or foreground driver to allow simpler use of the system by those with wide varieties of expertise. Users range from geologists and engineers to secretaries and librarians, she said.

PDS is being used by 90 petroleum companies and several businesses and government agencies for a total of about 600 people on the system, she concluded.

Early Evaluation of Tools Seen Key to Software Plans

DALLAS — Early identification of an appropriate and complementary set of software engineering and project management procedures, controls and technologies is essential to good software project planning, according to speakers here recently.

Leon G. Stucki, systems development program manager at Boeing Computer Services, said the most important consideration when choosing a tool to improve productivity is payoff.

The organization should choose the system that has the biggest return on investment, Stucki told a group largely composed of project managers.

Users should remember they can not expect tools to be "commissioned today and up and running tomorrow. Early consideration of tools is very important," he said.

The organization should also "place tools in their proper perspective." There are "some elegant tools that are either too costly or require too much manual work to set them up," he cautioned.

Tools are also not free. "They do consume resources," and setting up the tools can be costly, demanding more resources than it is worth, he said.

The manager should "view the system in total perspective but, when planning, view it as a series of baselines and phases," according to Ray Caudill, team leader in the Air Force Data Automation Agency.

The development process is a continuum, he said, but it can only be handled when broken into pieces. "Why do software development efforts fail?" he asked. "Because we have not broken life cycles down into manageable, understandable entities."

Project Review

Review is another method of making sure projects succeed, Caudill said. "I've heard people say reviews are not worthwhile — that they are difficult to handle and manage. But from my point of view, the review is very important," he said.

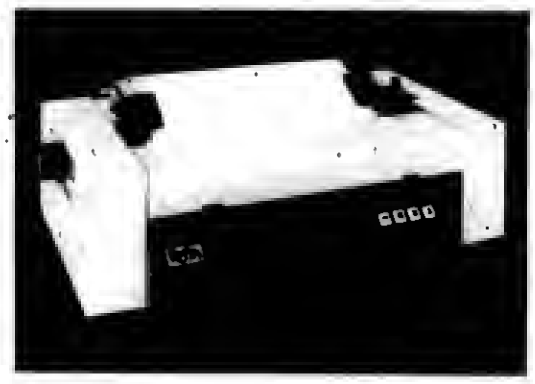
At formal review time, users and DP people have a chance to change the project. This forces the users to think through the problem and also commits the DP people to say we know enough to go on to the next phase," he stated.

"Programming is unique in that it is one of the few tasks in which it's possible to work continuously but progress backwards," according to H. Sam Woodgate, manager of the public service section of Dataskil, a large British software house.

The firm is managing from 50 to 60 different jobs using system-generated data. The computer output is used as a management tool to help in planning, he indicated.

According to R. Dean Hartwick, manager of information systems operations at Logicon, Inc., the cost of doing a legitimate test effort is about 45% of the total cost. "Clearly test planning is a crucial part of the operation," he said.

Hydra Printers Print APL At 300 lpm



For a 20 character per line APL printout, Hydra's memory management technique automatically optimizes line speeds to produce dramatic throughput rates.

Not only exceptionally fast printing, character formation is also superb because of Hydra's 9 x 9 APL dot matrix. And the printer is switch selectable between APL and ASCII.

Hydra Printers also have the ability to backspace for overstriking or underlining, especially valuable when printing APL or customized character sets.

Hydra, the optimum choice for end-users, OEMs, system houses, data communication networks—and for your particular application, whatever it might be.

Write or call us for an actual APL printout, and for complete information on Hydra Ballistic™ Matrix Printers.

Data Base Move Requires The Right Types of People

By Stephen Robinson
Special to CW

Data Base Corner

I have received several interesting responses to "Move to Data Base Requires Changes in Philosphy" [CW, June 6]. The tone of many of the letters was the same: "We know our systems are not making full use of hardware and softwarecapabilities. What do we do about it?

Some of the issues the letters raised are not directly related to data base details, but they are important. Like a careful consultant, I will not claim to have all the answers. I do, however, know some of the questions such as:

• **Planners or caretakers?** Somewhere in your organization is an individual or group of individuals who have primary responsibility for recommending upgrades/modifications/-discards of hardware.

Usually this group prepares a financial and technical recommendation for the ultimate decision makers, who control the purse strings.

Let's look at this group. Do they know what a minicomputer is? Would they recognize a microcomputer chip if someone slipped one in their lunchboxes? Or do they simply upgrade whatever computer line was present when they joined the compnay?

Put another way, is your computer center being looked after by kindly caretakers who wouldn't rock the boat if they could find a boat to rock? Or is it being managed by tough individuals supported by technical staff who know what is going on in the hardware area?

If you are in the former category, consider a transition to the latter. How you effect such a transition is clearly a function of you organization's structure and politics. A future column will contain a disguised case history of how one company managed the transition.

• **Business or computer analysts?** When your prospective "clients" talk to someone about their data and information requirements, do they talk to a business-oriented or a computer-oriented individual?

A client should first be able to talk with a business analyst who understands the environment that is creating the information requirement. The business analyst may be able to make significant contributions to the user's original concept of information requirements.

Once they have conceptualized the information requirements, the business analyst and the user get together with a computer analyst to discuss the proposed system and see how it can be implemented.

The computer analyst must personally be familiar with the state of the art in hardware and software or go to the meeting with technicians from the data center who have such knowledge.

Far too many systems are bungled at this stage. The computer analyst typically is constrained (actually, or in his own mind), by the existing hardware and software. Innovation goes out the window.

An application best done on a dedicated mini gets shoehorned into the existing maxi, where its low priority and resultant poor response destroys the value of the system. Alternatively, a system that would be a natural for a special-purpose programming language ends up being done in Cobol, which results in the commitment of 200% more programming, debugging and maintenance resources.

So there is a need for two different types of analysts. Make sure your computer analysts really understand the world of DP or move them out of that very responsible position. And don't promote someone into that job just because he is a good programmer, programming supervisor or program analyst.

• **Is management managing?** It is evident the biggest problem is people. Find people with the required expertise, interest in their professions, curiosity in new developments and pride in doing a good job. The responsibility for finding, and motivating such people must lie with management.

Hiring should not be based solely on how many years of Cobol programming a person has on his resume or what courses he took at college. Several years ago, when I was doing college recruiting for Applied Data Research (ADR), I would look for enthusiasm first. Was the interviewee putting himself, as well as me, to sleep with a description of recent programming projects?

Secondly, I would look for interest. At ADR we had an interactive programming language called ESI for the Digital Equipment Corp. PDP-8. The instructions were one page long. We gave a simple programming assignment and went away.

After an hour or so we checked back with the interviewee. We were interested not only in the solution to the problem, but how many features the interviewee used and/or played with.

Similar screening techniques — perhaps with different focusses — are, I suspect, widespread even if unpublicized. Personally, I'd welcome letters describing the way readers evaluate applicants beyond checking resumes. I'd be glad to share your thoughts in another column.

The other side of hiring, of course, if firing. The small number of people dismissed for incompetence is not nearly reflective of the sad state of DP activity throughout the country.

At a recent meeting of over 100 DP managers, I asked how many had fired people for incompetence within the last year. Two hands were raised.

I then remarked that everyone else must be really lucky to have excellent staffs who developed systems on time and within budget that were well documented and easily modifiable. The resultant laughter died down only when people realized they had nothing to laugh about.

The systems gap can only be bridged by people. Data base system development must be accompanied by the development and acquisition of competent business and computer analysts.

The onus is on management to recognize the importance of the requisite expertise and to acquire it.

Architecture Based on X.25

NCR Unveils Distributed Network Plan

By John P. Hebert
CW Staff

DAYTON, Ohio — NCR Corp. has unveiled a standard-interface, packet-switched communications network architecture for distributed processing.

It was designed to consolidate and unify telecommunications architecture and protocols for all present and future NCR product lines, the company said.

The NCR Distributed Network Architecture (NCR/DNA) will be based on the CCITT X.25 protocol recommendation. It was described by Robert Galin, NCR's director of communications systems, as both an evolutionary outgrowth of existing NCR communications approaches and the addition of totally new concepts and equipment.

NCR/DNA will initially surface in products the company is planning to introduce late this year; the conversion of existing products to the unified approach should be completed in 1979, according to Galin.

The DNA approach allows any terminal in the remotely dispersed or in-house DNA network to access any user-authorized CPU and have data processed on it or to access any other authorized terminal in a network, Galin said.

It also separates communications processing tasks from applications processing, according to NCR.

The applications programmer is therefore insulated from the procedural aspects of communications, simplifying software and support for both realms, the company claimed.

Rather than centralizing control in a single host processor, DNA distributes control throughout the network, making it less vulnerable when a single network element malfunctions, NCR continued.

The DNA approach also makes possible the reconfiguration of networks to meet changing user needs without shutting down the network, it added.

Three Main Elements

The three main elements of the distributed architecture are Data Link Control, (DLC), the Telecommunications Access Method (TAM) and the Data Transporting Network (DTN).

NCR/DLC, based on the X.25 standard, is a bit-oriented protocol for telecommunications within DNA systems. All new NCR products will provide this protocol through added software modules called entry/exit service modules.

These modules will reconvert message header formats into the DNA network format and establish an end-to-end format, according to Galin.

NCR/DLC is similar to the American National Standards Institute's Advanced Data Communications Control Procedure (ADCCP) and the International Organization for Standardization's Higher Level Data Link Control (HDLC) protocols, NCR said.

As such, DNA will provide the means for establishing communications links from public data networks such as Datapac in Canada and Transpac in France, which are also based on X.25, NCR noted.

Networks operating under the DNA scheme will also provide users with a compatibility for non-NCR equipment that conforms to these protocols, as well as compatibility with equipment operaing in IBM Synchronous Data Link Control (SDLC), the company added.

NCR will make a commitment to be compatible, "but not necessarily" with IBM's System Network Architecture (SNA), Galin explained. "NCR plans to provide interfaces to appropriate non-NCR equipment, including host computers and terminals," he said.

NCR/DLC is described as operating on a message level, rather than a character level. It reportedly allows full-duplex operation between equipment in the DNA network and provides a high degree of error control.

In addition, DLC is the basis for a proprietary, high-speed (48 kbit/sec) modemless in-house communications technique "to which all future NCR systems will evolve." the company said.

NCR/DTN is a set of node processors and internodal links. It is the store-and-forward packet-switching system that serves user applications by moving information transparently, NCR explained.

These processes reside in terminals and communications processors connected to the

With Hardware, Software

Raytheon PTS-100 Emulates SDLC

NORWOOD, Mass. — Raytheon Data Systems Co. has enhanced its PTS-100 series of programmable terminal systems to support communications under IBM's Synchronous Data Link Control (SDLC) protocol.

The enhancement permits PTS-100 systems to perform the functions of remote IBM 3270 equipment communicating with a host mainframe under SDLC, the company stated.

Central to the PTS-100 SDLC enhancement is a communications adapter built around an 8-bit microprocessor according to a spokesman. The communications adapter provides an interface between PTS-100 control units and modems with speeds ranging from 2,000- to 9,600 bit/sec, he said.

The software required to support SDLC communications from PTS-100 configurations resides in 4K words of MOS memory on the communications adapter board. As a result, the adapter can be reprogrammed as requirements change, Raytheon noted.

The adapter plugs into a low-speed multiplexer port in the terminal control unit, permitting currently installed PTS-100 systems to upgrade to SDLC capability.

System upgrades require only a tape cassette containing remote 3271 SDLC emulator software and the SDLC communications adapter, which replaces the existing BSC modem adapter.

There is no charge for the SDLC emulation software on new PTS-100 systems, Raytheon stated.

The cost of the SDLC communications adapter, required to upgrade existing installations, is $1,000.

Raytheon is at 1415 Boston-Providence Tnpk., Norwood, Mass. 02062.

Group Releases Glossary

OTTAWA — Outside the world of computers and telecommunications, a "duplex" is a place to live and a "stuffing character" is a basketball star.

But in the communications field, a stuffing character is "a character used on multiplexed isochronous transmission links to take into account the differences in clock frequencies," according to a comprehensive glossary of communications terminology released recently by The Computer Communications Group of the Trans Canada Telephone System here.

Three years in the making, the glossary covers many of the new terms and acronyms that have evolved with the expanding field of computer communications, the group said.

The 32-page booklet defines commonly used terms at a semitechnical level.

It is available in English or French, costs $1 and can be obtained from the group at 12-160 Elgin St., Ottawa, Ont. K1G 3J4, Canada.

Lear Siegler CRT Works In Burroughs Environment

ANAHEIM, Calif. – Lear Siegler, Inc. has introduced a dual-mode interactive CRT terminal said to be compatible with Burroughs Corp. CPUs and equipped for the Burroughs network polling environment.

The ADM-2B is switch-selectable for operation in two different modes. In one mode, the terminal functions as a standard ADM-2; in the other, it is a Burroughs Series TD800-compatible polling unit, a spokesman explained.

In the TD800 mode, the terminal reportedly adheres to standard Burroughs poll and address line protocols; has a forms mode for field protection; and offers text-editing features.

Switch-selectable line diagnostics for troubleshooting the data communications network and eight status displays set to provide the operator with error and status information are other features offered by the terminal, the spokesman noted.

Terminal Transactions

In addition, the ADM-2B will operate on the same lines with Burroughs TD800 and TD820 terminals, according to Lear Siegler.

Standard text-editing functions of the ADM-2B in both modes include erase to end of line/field/page; insert and delete character or line; blinking or blanking fields; cursor control; and addressing.

The terminal also features scrolling, tab set/reset, limited polling and full- and half-dulex transmission at 110- to 9,600 bit/sec, the spokesman added.

The terminal's CRT displays 24 lines of data at a density per line of 80 5 by 9 dot-matrix characters in a 7 by 11 dot-matrix field, he said.

The ADM-2B costs $2,485. An optional RS-232 interface costs an additional $50 from Lear Siegler at 714 N. Brookhurst St., Anaheim, Calif. 92803.

OCR SAVES MONEY

How Erie County, NY saves over $300,000 a year with OCR

It's a fact that most county government data processing departments have very tight budgets . . . and Erie County, NY is no exception. Gerald E. Wilson, Erie County's director of data processing recognizes that up to 30% of the cost of the average county government computer installation is in data entry. He initiated their use of OCR to cut those costs.

After careful evaluation they selected the Laser OCR-One optical character recognition system. Just one example of how Erie County cuts their data entry costs with the Laser OCR-One is their county nurses reporting system. This innovative new system alone saves at least $5,280 a week! An added bonus is more meaningful management reporting.

Despite a 15% staff reduction in their data processing department, Erie County has achieved a 16% increase in efficiency in 1975 and an additional 10% in 1976. Jerry Wilson says, "We really couldn't have gotten by without scanning and our Laser OCR-One."

For information on how you can cut data entry costs, contact

ISC 8001 Gets Arabic and Farsi

NORCROSS, Ga. – Intelligent Systems Corp. (ISC) has developed a keyboard operating system in Arabic, Farsi and a number of other languages for its Intecolor 8001 eight-color alphanumeric/graphic terminal.

The operating system is said to change the shape of letters depending on their position in a word, allowing the operator to enter letters without regard to character forms.

In addition, when numerals or English alphabet characters are entered, they are automatically justified left so they can be read left to right, the company said.

The keyboard operating system increases the cost of an 8001 from about $2,400 to about $4,400. If a user wants Ascii characters for the terminal, it will "cost more than $5,000," while the Basic language compatibility costs less than $1,000, depending on the additional memory necessary, the spokesman said.

ISC is located at 5965 Peachtree Corners East, Norcross, Ga. 30071.

Series 100 Certified

COLUMBUS, Ohio – The MI² Corp. Series 100 TWX/DDD modem has been granted certification from the Federal Communications Commission in the Part 68 long-form registration procedure.

The registration allows users to connect the equipment to the switched telephone network; MI² has already produced and is presently shipping Series 100 modems.

MI² is at 1212 Kinnear Road, Columbus, Ohio 43212.

Bank Verifying Client Signatures on CRTs

DALLAS — A small bank here has reportedly become the first in the country to add a new wrinkle to banking — verification of customer signatures displayed on terminals located at teller stations.

Aside from the novelty of the approach to signature verification, the terminals perform a range of other functions and have saved Commonwealth National Bank enough money to justify the cost of five drive-in teller stations, according to Omar Dennis, the bank's senior vice-president and cashier.

Since early this year, Commonwealth National has been using the Signature Verification terminals supplied by Signature Technology, Inc. and made by Informer, Inc. to shorten waiting lines inside the bank and at drive-in windows.

Waiting time, especially at the drive-in teller stations, has been cut in half; the terminals also have helped to deter forgers, improve teller efficiency and productivity and preserve the goodwill of customers, Dennis said.

The terminals are tied to a Honeywell Information Systems, Inc. 2058 host CPU located 10 miles away at Affiliated Computer Systems, the bank's service bureau at 2,400 bit/sec over AT&T private lines.

Captured by Camera

Tellers can display information on customers' checking, savings and loan accounts as well as call up a digital display of the authorized signature for that account, Dennis said.

Signatures are captured at the same time a new account is established by a separate desktop, camera-equipped capture unit and stored in digitized form in the service bureau computer.

To capture a signature, a clerk positions the specimen on the capture unit, then depresses a capture key on the keyboard. If the display appearing on the terminal is satisfactory, the clerk then depresses the SEND key to transmit the signature to the computer for storage.

Commonwealth National, which processes an average of 17,000 checks daily, now has 15 Informer Model 301 Signature terminals — one at each of five drive-in stations, four shared by 10 internal tellers, plus one each in bookkeeping, general ledger, new accounts, credit inquiry/customer service and the loan department.

Operations and administrative officers have executive inquiry models to inspect any of the bank's 21,000 accounts.

'Cusomers Fascinated'

"Our customers have been fascinated," Dennis said. "They say they feel a little more secure against someone forging a check on their account, but the real benefit is good will anytime the customer comes to the bank.

"This is especially true at the drive-in stations. The teller doesn't have to ask for further identification or interrogate the customer," he siad.

"Previously, we used the direct card system for signature verification," Dennis recalled. "Tellers inside the bank had to walk over to a central file and look up the customer's card. In the drive-in stations, tellers had to phone inside the bank. If there was any question, they had to send the customer inside.

"Bank employees love it, too," he added. "With the old card system, they had to leave their cage and leave their customer waiting while they verified a signature or looked up a balance.

"Now, they either have a terminal right next to them, or some may have to cross over four or five feet to a shared terminal."

The Signature terminal's small size and relatively inexpensive cost has prompted Commonwealth to install CRTs without the signature feature in other departments of the bank, such as the loan department. The terminal has a full keyboard with a pedestal-mounted 6-in. CRT.

Commonwealth National chose the Informer Signature terminal after carefully evaluating microfiche and closed-circuit TV, according to Dennis.

"We were looking for something that was compact. Microfiche has to be updated, changed and added to periodically. With closed-circuit TV, we would have needed an extra person just to man the station," he noted.

"In comparison, we felt that with the amount of money we would have had to invest in microfiche or, TV plus the extra people to operate them, vs. the amount of investment in the Signature system, we are financially better off with the 15 Signature units.

"What we saved by going with the Signature terminal system has justified the cost on five drive-in teller stations alone," Dennis said. "The Signature terminal is basically just a different type of CRT that happens to be lighter in weight, less bulky and takes up less space in the teller's cage where space is at a premium."

NCR Unveils Net Scheme

(Continued from Page 25)

network and address each other by English language names, without regard to physical location.

Each processor node — whether it be a separate piece of hardware or software "buried" in a small CPU in the network — will have user-programmable conversion tables, Galin said.

The conversion tables will convert the English address consisting of a 12-byte field to a physical location address of 15 to 23 bits and then transmit to the next node. Each node will in turn determine whether the information packet is for it or for another node further down the line, Galin explained.

NCR/TAM functions as a boundary between applications object programs and the telecommunications devices, the company stated.

Other functions of the access method include system and link control, queue management, resource scheduling, addition/deletion of packet headers, error recovery and reporting and operational diagnostics, it said.

NCR/TAM will have no relation to IBM's Telecommunications Access Method (Tcam) except for the operating system and access methods. There will, in essence, be no compatibility with IBM's version, Galin claimed.

The DNA network was designed to use dedicated lines presently provided by communications common carriers, although NCR will offer users the option of employing dial-up lines as backup, according to Galin.

NCR will announce the first communications processor designed under DNA guidelines, the NCR 721, next month. The first DNA terminal will be introduced by the end of the year, and there will be a string of products announcements in the first half of 1978.

'Pushes More Data'

The DNA protocol scheme, like its international counterparts, makes more efficient use of communications lines — "pushes more data through the same size pipe" — because of the elimination of conversion overhead and the use of simultaneous, two-way communications, Galin remarked.

If present users want the capabilities of the distributed architecture, they will have to weigh the cost of conversion against the operating cost benefits of such a system, he added, indicating the cost of conversion could be very high.

"There will be restrictions both on the number of CPUs in a network, as well as how many can communicate simultaneously, Galin admitted, adding those limits will be divulged in the first half of next year.

Why settle for less when nothing costs less?

At $750*, the Soroc IQ 120 is now priced lower than any OEM terminal on the market.

Yet it provides **standard** features that others offer as options. For example:

- lower case
- numeric pad
- protect mode
- tabbing
- cursor addressing
- controllable auxiliary port
- auto repeat
- dual intensity
- 15 baud rates (75 to 19,200)

The smart money is on IQ 120.

Call us toll free now for other quantity discounts and delivery dates.

To Lease or to Purchase?

User Changes Upgrade Query Approach

DENVER — Data Power, Inc. has upgraded its DP capabilities four times in the past four years. But when the service bureau made its latest change last December, it decided to buy its own mainframe instead of continuing to lease.

"Our growth has stabilized at about 10% a year and, at that rate, we feel our system will serve our needs for at least another eight years, and perhaps more," Russ Lowery, Data Power president, explained. That stability in growth is what made Data Power confident enough to purchase instead of lease, he said.

"With so much power and the built-in provision for expansion, the obvious economies of outright purchase over leasing became paramount. This was especially true because of the equity we had built up in peripherals such as our disk drives," Lowery noted.

"Furthermore, since we had been an NCR user since the day we replaced our punched card equipment with a disk-oriented computer, there was no conversion problem," he added.

The company which is now Data Power had its genesis as the DP department of Cummins Power, Inc., the diesel engine distributor. Cummins' first NCR computer was a 16K Century 100, which was installed in 1969. That was replaced with a 32K Century 200 when Data Power was established as a separate entity in 1973.

This card reader was the only peripheral Data Power bought when it made its latest upgrade.

A year later, co-ownership in the service bureau was acquired by Colorado Kenworth, Inc., and Data Power added a 32K-byte Century 101.

The additional processing capacity was needed because Colorado Kenworth sells and services over-the-road tractor rigs and generates about 5,000 invoices a month.

Steady growth in the demand for DP led to Data Power's decision in early 1976 to replace its Century 200 and 101 systems with a 128K Century 151. A major benefit was the system's multiprogramming capability, Lowery noted; three programs could be run simultaneously instead of the previous two.

The need for enhanced flexibility became urgent as the service bureau expanded its roster of customers. Data Power saw its Century 151 would not be adequate, in part because the two owners were becoming interested in on-line access to their data bases.

So instead of expanding the Century 151 CPU to its maximum of 256K bytes, the service bureau bought a 256K-byte Criterion 8550.

The price was nearly the same as the cost to boost the CPU of the 151, Lowery said, and there were several advantages. Among them is the fact that the Criterion CPU can be expanded to 1M byte in increments of 64K and the fact that the internal memory is twice as fast as that of the 151, he pointed out.

"With respect to the speed," Lowery said, "the critical consideration is that there will be no degradation of response time with on-line processing. In addition, whenever it may become desirable, the internal speed of the Criterion can be nearly doubled with an adjustment which takes only 10 minutes or so to perform on-site.

"Another advantage with the Criterion is its virtual memory, which permits data to be moved back and forth between the CPU and disk storage at high speed, enabling us to run more jobs simultaneously."

Series of Micros

The central processor of the Criterion is actually a series of microprocessors which are linked by a transfer bus like those found in many minicomputers. Through the use of floppy disk firmware, the CPU can emulate virtually any other computer, a CDC spokesman explained. It can therefore run Data Power's Century programs with no conversion required, or it can function as a Cobol virtual machine and can compile Fortran, RPG and Basic, he said.

The only peripheral added to Data Power's Criterion system, aside from the CRT operating console and its thermal printing I/O writer, was a 600 card/min reader.

The company retained its 1,200 line/min printer, its 800- and 1,600 bit/in. tape drive

(Continued on Page 30)

Planning Can Minimize Effect Of All Types of Catastrophes

By Jack S. Barritt
Special to CW

As firms become increasingly dependent upon having DP capabilities, there are two important questions that management must ask itself.

The first is, "What are the short- and long-term effects on operations if our existing DP capabilities are lost?"

Secondly, management must ask, "What can we do beforehand to reduce the overall impact of such a loss?"

The answer to the first question needs to be thorough and detailed. Each plant department or organizational unit that uses the computers should be required to outline what effect, if any, there would be on its operations if the computers become unavailable without prior notice for one day, one week or one month.

Also, they must determine what substitutes, if any, can be employed during these times and what would be required in terms of manpower, equipment and facilities.

As these replies are analyzed, it should become apparent how heavily computer activity impacts the overall operations of a firm. The analysis will also determine the time frame in which recovery must be made if serious disruptions are to be avoided.

A critical condition will exist when the effects are obviously immediate, serious and with no economically practical substitutes.

Serious fires in early computer installations focused attention on the need for specialized protection for this valuable and highly sensitive occupancy. After initial action by some of the larger insurance organizations, the National Fire Protection Association (NFPA) formed a special technical group in January 1960 known as the Committee on Electronic Computer Systems.

In 1962 the first edition of the Standard for the Protection of Electronic Computer/-Equipment — NFPA No. 75 — was adopted. Revisions were subsequently adopted in 1963, 1964, 1968, 1975 and 1976.

As a result, combustible construction is usually avoided and the computer facility is isolated from exposing occupancies. Smoke detectors are installed for early warning of impending trouble. Automatic sprinklers and/or Halon 1301 total-flooding systems are provided for fires that cannot be quickly controlled by or exceed the capability of portable extinguishers.

But natural or man-made disasters still occur and will continue to do so, although hopefully at a reduced frequency. For example:

- In New York, as a result of storm Agnes, a corporate computer facility serving a number of outside plant locations was destroyed by flood at the same time that the main telephone cable for the community was lost.
- In Georgia, a tornado knocked out the computer facility for a large manufacturing and warehousing complex.
- A $700,000 insured loss occurred in California when a high-pressure water main ruptured beneath a one-story building housing the computer system controlling the receiving, sales and warehousing operations of a large distribution firm.
- In Massachusetts, a fire that originated two floors below a computer center spread vertically through a cable shaft and virtually

(Continued on Page 30)

Seminar on Management Set

DELRAN, N.J. — Datapro Research Corp. is offering "Effective Computer Operations Management," a DP technology seminar for managers, supervisors and key computer center personnel.

The three-day seminar will be held in Chicago on Oct. 12-14 and Dec. 7-9, in New York on Oct. 3-5 and Nov. 2-4, in Philadelphia on Oct. 24-26 and in San Francisco on Sept.12-14 and Dec. 12-14. It will also be held in Washington, D.C, on Sept. 19-21 and Nov. 9-11.

The seminar is designed to discuss the controls, techniques and procedures of effective computer operations management, offering discussion in implementation, problems, successes and failures, a spokesman noted.

The seminar costs $425 for current Datapro subscribers and $475 for nonsubscribers. A brochure with the complete course outline is available from Datapro at 1805 Underwood Blvd., Delran, N.J. 08075.

Preplanning Minimizes Impact of Disasters

(Continued from Page 29)

destroyed the center through the actions of heat, soot and corrosive gases.

- A number of militant groups across the country have used gasoline fire bombs or explosives to damage targeted computer facilities.

The most straightforward means for reducing any unacceptable impact is duplication at another site. However, complete duplication is normally not feasible because of the capital investment and operating overhead required.

Nevertheless, a significant reduction in overall dependency may be achieved by putting minicomputers at the point of use and terminating or restricting the use of the main computers for less complex or secondary programs.

Another and more commonly used alternative is the use of some other facility on an emergency basis. The success of this approach depends upon a number of factors:

- The requirement that the operations be batch-typed and not real-time (i.e., dependent upon an external telecommunications network).
- The proving by actual use that the substitute computer system's capability and configuration are compatible with existing programs.
- The existence of a firm, written agreement detailing the minimum amount of computer time available in an emergency, how soon it is available after initial request and for how long a time span.
- The prior establishment of priorities for handling various programs on a potentially restricted computer time base.

The final solution involves re-creation of the facility at the same or a substitute site. This approach is often dictated for on-line or real-time applications that receive and transmit data over external telecommunication connections.

Computers servicing multiple locations, such as for airline reservations or for directly controlling processes as in a chemical plant or paper mill, are examples of such applications. Success in this approach hinges upon:

- Availability of needed computer equipment on short notice.
- Availability of office space that can readily be converted for controlled computer environment.
- Efficiency in reestablishing telecommunications circuits.
- The ability to update data bases from the time of initial interruption.

Examples can be found where there have been miraculous recoveries as the result of herculean efforts on the part of many people, including the user and the equipment manufacturer. The key in most cases was a degree of disaster preplanning coupled with well-defined levels of authority.

This combination lends itself to efficient use of resources, coordinated efforts and timely decisions.

Accordingly, along with prevention, protection, prediction and preplanning, the final "P" in the successful disaster recovery effort has to be people.

Key personnel must be selected beforehand and given clearly defined assignments of responsibility along with commensurate authority. The best laid plans are all for naught until someone takes charge and motivates, inspires, coordinates and directs other people.

So, plan well — but make sure that the plans will be activated and followed in the manner intended by choosing your disaster team just as wisely.

Barritt is the chief research engineer for Industrial Risk Insurers of Hartford, Conn.

User Switches Upgrade Method

(Continued from Page 29)

and its six dual-density disk drawers, each capable of putting 48 million characters of information on-line.

"We could have gone to the 100 million character disk units," Lowery noted, "but we had a substantial lease equity in the old ones, and we need the six separate drawers to run different customer jobs simultaneously."

Each of the company's principal owners, Cummins and Colorado Kenworth, has three CRT terminals in its headquarters. This number will probably increase to 20 at each company when their branches are linked on-line to the Denver DP center, Lowery said.

With this step, he continued, all invoice billing and repair order processing will be input through the CRT keyboards. This data is now being keypunched in batch mode from time cards and handwritten records.

The service departments of the two major users receive a preinvoice audit which details the charges for parts and labor on each job.

"This is important because it permits them to review the proposed charges before customers see their bills," Lowery said. "When you have to operate in a warranty environment as such companies do today, you can avoid unnecessary customer complaints by making the appropriate bill adjustments ahead of time. In addition, of course, such a step helps ensure accuracy."

The rationale for the creation of Data Power, Lowery continued, was to provide Cummins Power with the expanded DP capacity it needed, yet amortize the cost for that among others who could use the computer center when it would otherwise be idle.

Finally. A full-power
that doesn't tax a
Or an operat

We call it the CalComp IGT-100.

It's an acronym with the emphasis on action. Short for Interactive Graphics Terminal. A unique, new CalComp graphics tool that effectively combines built-in intelligence with advanced refresh technology.

The first in a new family of Interactive Graphic products from CalComp. All specifically designed to make things easier for both the host computer and the terminal operator.

For starters, we made the IGT-100 interactive. And truly intelligent. So it's fully capable of sharing the graphics workload with its host computer.

Then, we gave it a longer-lasting raster scan (TV) type display. To produce faster, brighter, flicker-free images. To give you sharper, black-and-white graphics. And to totally eliminate time-consuming image redrawing.

By contrast, most graphics terminals in the field today (with storage tubes) are about as far from interactive and intelligent as you can get.

Dependent is more like it. Because, typically, every graphic image — and every graphic manipulation — has to be carefully calculated, then transmitted, by the host computer to the waiting graphics terminal.

This whole routine not only puts a tremendous burden on the host computer (which usually has other jobs to do) but routinely requires lots of special software.

With storage tube type terminals, even routine manipulations like panning, zooming, selective erasing and message changing aren't very fast. In fact, the terminal operator is required to wait — up to several minutes — for a previous image to be completely erased and the second image to be tediously redrawn.

You get the picture, all right. But you'll get it faster with the new CalComp IGT-100. Because the IGT-100 is the quickest solution to these traditional problems. And easily, one of the most affordable.

Thanks to our built-in microprocessor, efficiency doesn't get lost in the shuffle.

A built-in microprocessor helps make the new IGT-100 one of the smartest graphics terminals you can buy. And one of the most efficient.

Coupled with 12K bytes of RAM memory, the IGT-100's microprocessor permits local storage, manipulation and completion of display functions. While providing an addressable memory matrix of 1024 X 680 bit positions. And a viewable matrix of 416 X 312 positions.

A keyboard with a 64 character ASCII set and an asynchronous RS-232-C interface are also supported by the IGT-100's microprocessor. Full or half duplex modes are switch-selectable. Along with asynchronous communication transmission rates from 300 to 9600 baud.

Give your new IGT-100 the whole picture and you'll never redraw it again.

Unlike most other graphics terminals, the new IGT-100 can store and manipulate images on a totally local level.

That means once an image is transmitted, you've got complete, autonomous control. All planning, selective erasing and message changing is instantaneously handled by the IGT-100's built-in microprocessor.

Even write-thru's, grids and zooms (2x, 4x, 6x and 8x) are displayed on the screen within 1/10th of a second.

And all without tying up your host computer. Or waiting several minutes for the image to be redrawn on a storage tube.

In fact, working with its built-in microprocessor, the IGT-100's longer-lasting raster scan screen will beat a conventional storage tube every time. Delivering a faster, brighter image at a flicker-free rate of 60 frames per second.

And that's a mighty pretty picture — any way you look at it.

Reader/Punch Links to LA36

WELLESLEY HILLS, Mass. – The National Computer Communications Co. has introduced a paper tape reader/punch that reportedly interfaces with the Digital Equipment Corp. LA36 and LS-120 terminals.

It will also link to any other terminal that uses an RS-232 interface supporting standard automatic send/receive (ASR) requirements, a spokesman added.

The Mode 1050 reads and punches at 30 char./sec and can optionally convert Ascii to EIA code.

The unit costs $2,295 from the firm at 171 Worchester St., Wellesley Hills, Mass. 02181.

For Varian 4000 Series

Interface Converts Vector Data to Raster

PALO ALTO, Calif. – Varian Graphics has a microprocessor controller interface that reportedly reduces the computing power needed to produce graphic output on electrostatic printer/plotters.

Graphware I is a 5 mHz control store processor that uses digital techniques to generate raster data from vector data, a spokesman explained.

Accepts Sorted Vectors

The interface I accepts sorted vectors as input and generates raster data for output to the firm's Statos electrostatic printer/plotter. It allows the particular application program to pass sorted file information from the host processor directly to the interface without requiring additional computing to be performed on the vectors, he claimed.

Graphware I was designed to operate with any of Varian's 4000 series printer/plotters. It is supplied in a rack-mounted or stand-alone configuration.

The unit costs $4,850 and comes with 1K byte of memory, which provides for 160 current vectors. It can be configured with up to 32K bytes, the spokesman noted from 611 Hansen Way, Palo Alto, Calif. 94303.

Free Pamphlets Available

Six firms are offering to readers free brochures or pamphlets describing their products and services.

The Computer Products Division of Electronic Memories and Magnetics Corp. (EMM) is offering an application note describing an insurance company's selection process and benefits of add-on memory for the IBM 370/155. "User Notes No. 1" can be obtained by writing to EMM at 3216 W. El Segundo Blvd., Hawthorne, Calif. 90250.

A four-page brochure describing the System 200 Record Processor by A.B. Dick/Scott is available from the company at Alvord St., South Hadley, Mass. 01075.

Tandem Products

A 12-page brochure explaining the hardware and software organization of Tandem Computers, Inc. systems is available from the firm at 20605 Valley Green Drive, Cupertino, Calif. 95014.

A magnetic media maintenance equipment buyers catalog is available from Richard Hurley at Kybe Corp., 132 Calvary St., Waltham, Mass. 02154.

Applied Color Systems, Inc. has a bulletin describing its Spectra-Sensor continuous curve plotter. The bulletin can be obtained by writing to the firm at P.O. Box 5800, Princeton Service Center, U.S. Highway No. 1, Princeton, N.J. 08540.

Guildon Industries, Inc.'s AP-20 thermal printer is described in a four-page catalog the firm is offering from its Measurement & Control Systems Division, East Greenwich, R.I. 02818.

Correction

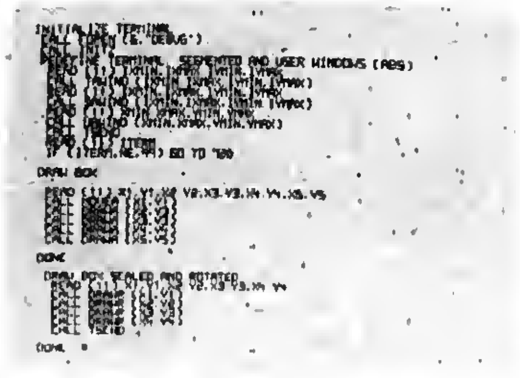
The first two parts of the "Merged Technologies" series [CW, July 25, Aug. 1] were coauthored by Frank Malabarba, a computer specialist with the U.S. Navy at Indian Head, Md.

ed graphics terminal
computer's power.
or's patience.

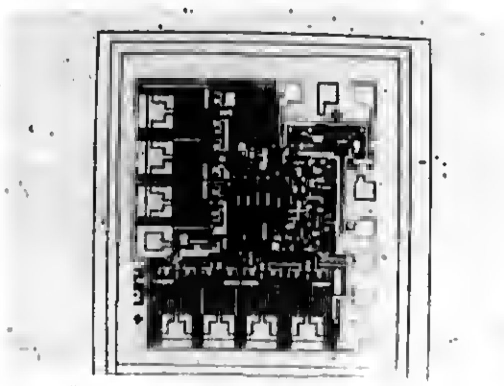
Six images that warrant some serious comparison shopping.
A quick look at basic viewing capabilities and you'll soon discover there's not a more versatile graphics terminal around than the CalComp IGT-100.

100's introductory price is super-competitive. Especially compared to storage tube devices. (And there's an equally attractive leasing plan, too.)

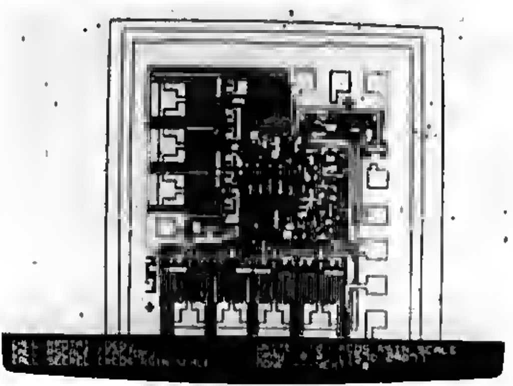
But we didn't stop with just a great terminal at a great price. We added an entire year's worth of



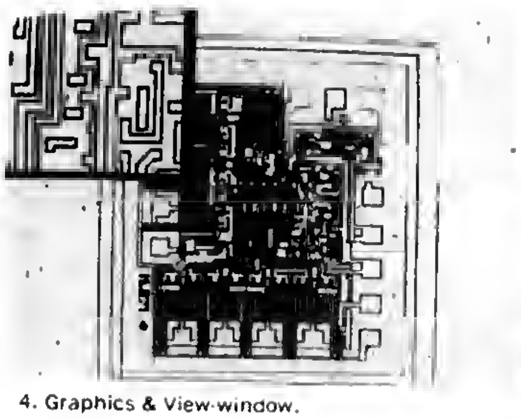
1. All alpha-numerics.



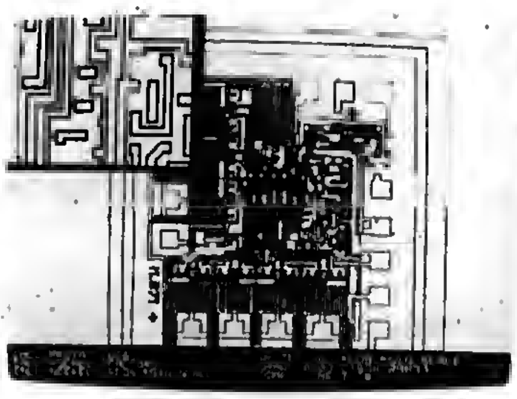
2. All graphics.



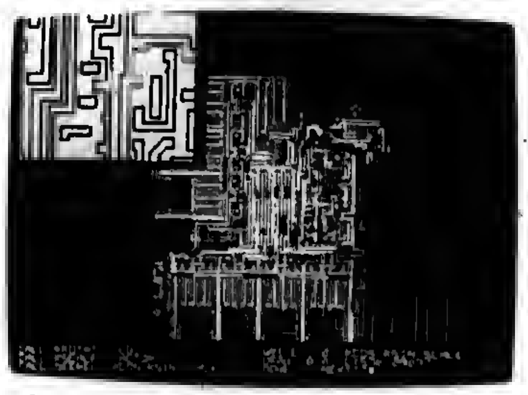
3. Alpha-numerics & graphics.



4. Graphics & View-window.



5. Alpha-numerics, graphics & View-window.



6. Alpha-numerics, Graphics & View-window (with reversed-out section).

To begin with, the IGT-100's special three-way, split-screen design provides you with separate alphanumeric, graphics and view-window sections.

Plus the ability to independently view and control (i.e. panning, zooming, etc.) one or a combination of these sections simultaneously.

Images can even be reversed (white on black) in the graphics and view-window sections.

The IGT-100's basic screen design maximizes the amount of data that can be displayed while providing you with six basic screen arrangements. Annoying superimposed messages have been totally eliminated.

It's about time someone came up with a screen that you can tailor to fit the job — instead of the other way around. And that's exactly what we did.

Did we mention the competitive price?
Price shouldn't be the primary consideration when you're looking for a full-powered graphics terminal.

But it's usually close to the top of everyone's list. That's why you'll be glad to know that the IGT-

service — labor, parts, everything — to the deal. Right along with the finest graphics terminal support software. (It's even compatible with standard CalComp plotting software and Plot 10.)

And then we backed it all up with CalComp's worldwide network of field engineers.

So if you're looking for a great deal on a graphics terminal, take a hard look at the new CalComp IGT-100.

And don't let a little thing like a low price scare you.

CalComp's New IGT-100.
The time you save may be your own.

Diskette Datashare-

The Breakthrough Your DP Budget's Been Waiting For.

And waiting for. An inexpensive, multi-user system that increases your data processing capability without depleting your pocketbook.

Datapoint announces Diskette DATASHARE® — a new combination of hardware and software that features the power of our DATASHARE Business Timesharing System and the economy of a diskette-based processor.

With Diskette DATASHARE, you can implement a timesharing system with up to four concurrent users on individual 3600 Datastations. Based on the 48K Datapoint 1170 Dispersed Processor, the system uses advanced disk buffer management techniques to produce an astounding 32,000 bytes of virtual memory for each user. Data is stored on convenient diskettes using any of Datapoint's file access techniques, such as random-access or indexed-sequential. A total of one million bytes of on-line storage is provided.

What's more, Diskette DATASHARE contains the same versatile capabilities for external communications as the larger DATASHARE systems. Like DSNET,™ for remote disk file processing, and MULTILINK,™ for real-time telecommunications to a mainframe computer. So your Diskette DATASHARE system can become a node in a dispersed network as you grow.

And because all the members of Datapoint's family of hardware and software products are compatible, you can later upgrade your system without costly software revisions and retraining.

But the best news is the price. Now you can install a full, four-station DATASHARE capability for under $27,000, or $830 a month on a three-year lease (metro-area maintenance included, printer optional). That's right — your DP budget can finally breathe easy. While your operations run more efficiently than ever.

Find out more about Diskette DATASHARE. Contact the Datapoint sales office nearest you, or write:

Most Machines Powered Down

Citibank Minis Survive Blackout Easily

By Esther Surden
CW Staff

NEW YORK – What happened when last month's blackout hit Citibank's myriad of minis?

The systems performed admirably, according to spokesmen for the bank, which has a well-publicized policy of decentralization with small systems.

In fact, the minicomputers came through the blackout unscathed, prompting one vice-president to remark that his operation would have been really damaged if it was still running on a large batch-oriented mainframe.

"During the blackout, I only had two machines with auxiliary power," Gary Geresi said. The vice-president of services management for securities systems noted "the rest were on floors that did not have the auxiliary power."

Geresi is in charge of 25 Interdata Inc., minicomputers that perform a securities processing application.

"When the blackout hit, we powered down the minis" to prevent surges, he explained. Staff was kept on duty around the clock to be available to test for file integrity as soon as power returned.

Testing for power integrity was also performed during the blackout on the two operating minis. When the power was finally restored, the file integrity tests were completed and "we then ran Wednesday night's work.

"We were absolutely satisfied with the performance of the minis and no data was lost," Geresis said. "By mid-morning Friday, we were up-to-date."

Nothing much happened to the six Digital Equipment Corp. PDP-11/70s in the National Banking Group either, according to Nicholas Papanikolaw, vice-president of services management for that area.

The bank has its own telephone system that is powered by Consolidated Edison power and has limited battery backup. But the bank does keep Bell Ssytem phones in strategic places for emergencies, and that is how Papanikolaw was alerted.

"The first thing I did was secure the building" to make sure that those working in it were all right, Papanikowlaw said. Then he proceeded to "power down all the minis" by pulling the main fuse. The DEC equipment was located on the sixth and 12th floors.

When power was restored, one system at a time was brought up. Only one of the PDP-11/70s sustained any damage, and that was the only system that was not processing at the time of the blackout, he said.

The memory board that was damaged was replaced easily and no head crashes or other major hardware problems occurred, he added.

Another vice-president in charge of several minicomputers, including three DEC PDP-11/70s and six Qantel systems, had a similar story to tell.

"The way we process, all of the minicomputers were shut down [when the blackout hit] except for the 11/70 on which we process our 'lock box' nightly updates, according to Jack Egan, vice-president, services management, World Corporation Group.

"The minis were not affected. The one 11/70 went down, but at the time it went down 90% of the work had already been processed.

The 10% of the checks yet to be processed were handled manually, he explained, and "we walked them over" to the Federal Reserve Bank.

Searcher Discovers Flexibility

By Esther Surden
CW Staff

Computer file of judgments and liens is updated daily at Law Bulletin Title Services.

CHICAGO – A switch from an IBM System 3/10 to a Univac 90/30 brought Law Bulletin Title Services here more processing power for its money while increasing its flexibility, according to George E. Chismark Jr., treasurer.

The firm runs a service for realtors, attorneys, bankers and title companies that provides judgment and lien searches for transfers of real estate.

Its parent company, the Law Bulletin Publishing Co., publishes the *Chicago Daily Law Bulletin* as well as a number of other newspapers, magazines and books.

Entering the title search field meant the company had to expand its DP capability. It developed its first DP operation in 1968 with the installation of IBM unit record punched card tabulating equipment to handle accounts receivable.

In 1971, a small card-oriented system 3/10 was installed to process other applications and general accounting. In 1974, a conversion was made to a disk-oriented 3/10 to accommodate subscription fulfillment services as well as enhance other applications.

Then, in 1976, the company began its search for a more powerful system.

"We were satisfied with our vendor and the product provided, so initially we looked to our own 'supplier,'' Chismark said." We ordered a 3/12 until we found out it could not do some things IBM promised it could do."

The company then looked at Burroughs, Univac and Honeywell equipment and had "investigative conversations" with each of the vendors.

"My DP manager had previous experience with Univac" and since that firm, like IBM, was located "right across the street," the switch in vendors was likely to make no difference in service, Chismark stated.

The most important reason for choosing the Univac system, however, was its flexibility and growth capability, he said. "This system can grow to a quarter of a million bytes of memory" and can accommodate 32 disk drives without changing hardware.

"With IBM and the other manufacturers, you have to change hardware," he noted, and with IBM that change included a conversion.

Configured with a main memory of 48K bytes, two disk drives with 58.9 Mbytes of storage capacity each, a 500 line/min printer and a 500 card/

In Security Trading Application

User Picks Mini Over Mainframe

PHILADELPHIA – An end-user department at Philadelphia National Bank (PNB) here is using a small business system to supplement its mainframes for its security trading application.

"When we decided to automate the Bank Investment Division at PNB, we discussed using the large central system, but decided against it for several reasons," Kenneth H. States, administrative officer, said.

First, the department was concerned about getting the information it needed when it needed it – "especially if a question of priorities arose."

It also wanted independence of operations from the large system so if anything went wrong with the mainframe computer, the department would still be able to function. The bank's central DP department has one IBM 370/168 and one 370/158.

Further, the software programs the Bank Investment Division wanted required a highly specialized background, States recalled.

After a year of investigating the various business systems available, installation of a Basic/Four Corp. Model 400 was recommended by READQ Systems, Inc., a New York firm that specializes in software for financial applications.

"What was of particular interest to us was the fact that we could get the software programs we wanted," States said. "READQ had the experience we were looking for, and the Basic/Four system was suited for the applications we had in mind."

The Bank Investment Division uses the computer for a broad range of transactions that involve the preparation of buy/sell confirmations for all money market instruments, municipal bonds and government obligations. It also handles dealer, trading and portfolio/escrow/collateral position accounting.

All types of special reports are generated. For example, trade date reports and settlement date reports are issued each day. Since a trade will be initiated on one day but the settlement doesn't occur until several days later, this has proved to be a much more reliable way than the previous "pen and ink" method to keep track of these activities, States

Switch From 1130 to Mini Eases DP Overload

By Ann Dooley
CW Staff

DEARBORN, Mich. — Peninsular Diesel, Inc. switched from an IBM 1130 to a Burroughs B1700 system because the company's rapid growth created the need for more core, disk capacity and total processing capability, according to George Mrla, assistant DP manager.

The system handles all the company's general accounting operations including payroll for about 300 employees as well as accounts payable and receivable, financial statements and general ledger, according to Gladys Moryc, DP manager.

Peninsular Diesel, a distributor for the Detroit Diesel Allison Division of General Motors Corp., has grown from one small outlet with three employees to a network of 63 franchised dealers in the lower peninsula of the state.

The headquarters coordinates sales, service, parts, engineering and administrative offices.

The old system wasn't able to meet the growing demands that were being put on it, Mrla said, so "we looked at everything that was out at the time and decided to go to Burroughs."

With the Burroughs mini system, DP operations could be cut to a single shift; now five programs can be processed at a time instead of the previous one, he said.

All of the staff was retained and absorbed so there was no problem there, Mrla continued.

When the system was first installed, the DP staff used Burroughs packages, but now "we do all our own," according to Mrla.

The system includes a 64K memory, 1M-byte disk storage, a 300 line/min printer, 600 card/min reader, a card punch, keypunchers and two disk packs, Mrla said. It is valued at $100,000, according to Moryc.

Accounting information is input via Teletype and punched onto cards. The cards are then run through the minicomputer, which produces an invoice.

The invoice will be mailed to the customer or filed depending on the information and its use, Mrla said.

Other applications include inventory control for more than 18,000 new and rebuilt parts and forecasting and pricing, Moryc said. The Teletypes are used in dealer and branch facilities.

There was no problem in switching from one system to another, Mrla said. "We were operating both systems for a year before we went entirely over," he said, adding parallel operation is "the only way to fly."

Peninsular Diesel distributes 33 basic diesel engines in four different cylinder sizes for trucks, boats, buses and trains; a complete line of Allison automatic transmissions for on- and off-highway use; torque converters; marine gears; and custom-fabricated Detroit Diesel-powered generator sets and power units.

In addition to handling the work for Peninsular Diesel, the B1700 also processes accounts for its sister company, Clarke GM Diesel, Inc., based in Cincinnati.

User Picks Mini Over Mainframe

(Continued from Page 33)

said.

"We have a fail report that tells us if a settlement has not been received when expected; we have a salesmen blotter that tells us at the end of the day what each salesmen has done. We have a purchase and sales blotter that comes out each day.

Our financial location report gives us control over securities and lets us know where such securities can be physically located," he continued.

The system helps the division know what actually is in inventory and is useful in situations in which several people are trading the same blocks of securities. In all, the system generates 30 reports.

Soon the division plans to have a customer activity profile that will tell it what a particular customer does each month to determine what kind of business he's doing and how the bank can improve and expand its service to him.

Besides the Basic/Four CPU, the division's system consists of two CRT terminals, two disk drives, a medium-speed printer and a high-speed printer.

IBM Users: Dearborn's DOS/RS™ is all the software you'll ever need, no matter what your core size...128K to ∞

At last...growth potential for your S/360 or S/370 with the latest version of Dearborn's Operating System/Real Storage.

DOS/RS is the single, fully-integrated system with total capabilities written into it—from the outset—to let you improve throughput beginning with the most modest core size right up the scale to 1 Mg...and beyond.

DOS/RS is the major enhancement of DOS Releases 26 and 27 that improves, extends and helps evaluate itself...without combining several different systems...without adding or modifying an existing system...without maintenance problems...without added costs.

DOS/RS improves 360/370 performance without installation and conversion problems. Installation is quickly accomplished in an orderly manner since all standard DOS functions are supported. What's more, many DOS/RS features will begin operating automatically. Then, as your core size and requirements increase, DOS/RS permits a gradual, phase-by-phase conversion to total DOS/RS capacity.

VISAM—a direct replacement for ISAM

Dearborn's new Variable-Length Indexed Sequential Access Method can be added to improve processing throughput and utilize disk storage more efficiently.

For detailed information on the all new DOS/RS and VISAM, call the nearest Dearborn office or write:

Presenting lunch hour programming.

Programming on other computers can eat up a lot of valuable time. But on Data General commercial ECLIPSE systems you can develop workable screen formats in as little time as an hour. So instead of having to wait for a break in your computer's schedule, you could do a small data entry program on your lunch break. And wrap up entire applications in days rather than months.

A Data General commercial ECLIPSE data processing system can do it because it's a real-time data management system. It uses Idea, our interactive data entry/access software for online screen formatting. Idea also has an online multiterminal monitor and powerful English-like language resulting in faster screen-related programming. Plus applications developed under Idea can automatically access and maintain files built by a highly sophisticated data management system, our INFOS software.

Our commercial ECLIPSE data processing systems also use ANSI '74 COBOL implemented at the highest levels. For fast batch program execution with minimal programmer retraining. Upgrading our system is no big deal either. It can grow right along with your expanding processing appetite.

Commercial ECLIPSE systems. The computer systems that digest programming easily and quickly. Send for our booklet today. Time is nibbling away.

Mail to: Data General, Westboro, MA 01581 CW822

It's smart business.

Evangelical Group Finds Minis Minister to Donor Information

MADISON, Wis. — Two minicomputers, one at headquarters and one in a division, have helped an evangelical organization here gain control over its complicated donor information system, according to officials of the society.

Inter-Varsity Christian Fellowship (IVCF) ministers to students and faculty at 800 colleges, universities, nursing schools and other institutions. Important to financing this effort is a donor information system, according to Robert Ford, director of headquarters services.

IVCF began its DP history in 1969, when it contracted with a service bureau with an IBM 360 to handle the mailing program.

The organization, however continued to grow at a rate that in the last several years has averaged about 25%. In 1971 various other programs were written and IVCF switched to a Madison bureau with an IBM 370/145 VS system; finally the association moved to time-sharing on a Univac 1100.

When the time came to move DP completely in-house, IVCF looked at mainframers and minimakers alike, "but the prices the mainframers were talking about" eliminated them, David Sironi, DP director, said. Minicomputers seemed a logical choice and the fellowship considered General Automation, Data General and Varian systems, among others.

Sironi compromised some of his requirements — such as his stipulation that the programming be done in Basic — in order to get a system the organization could afford. At the same time IVCF came in contact with an OEM that recommended the Mini-Computer Systems, Inc. Micos system.

The DP manager went to the vendor's headquarters, became acquainted with the operating system and language and decided it would do the job. IVCF then contracted for a completely turnkey system, which was delivered to specification.

The software was even tested on the OEM's system before the organization received its hardware, Sironi said.

Operations began last July. Donations are now entered on the day of receipt four days out of five — Monday is usually an exceptionally busy day and often requires carryover to the next day.

Receipts can be produced and in the mail within 48 hours, while address changes are also executed in that time span — both signs of effective list management, Sironi said.

The Micos system consists of a CPU with 64K memory, three 80M-byte disk drives, five CRT terminals, a 600 line/min printer, a 9-track tape drive and a printing terminal.

The cost? The operating system and equipment cost $110,000 and the software $33,000. Ford projected that labor and service bureau savings will pay for these expenditures within four years.

The installation at the Literature Division at Downer's Grove, under business manager Herbert Criley, is much the same as at Madison. The division had done its own order entry and inventory control software and added to this the accounts payable and general ledger packages developed by Mini-Computer Systems for Madison.

The Literature Division includes the Inter-Varsity Press, with 300 titles, a nine-times-a-year magazine, two bookstores and related operations. The computer services all accounts payable and the general ledger for the entire division and the order entry and inventory control functions for the press.

Megamini Prices Cut

OCEANPORT, N.J. — Interdata, a unit of Perkin Elmer Data Systems, has lowered prices for its 32-bit Model 8/32 Megamini up to 23%.

The basic 8/32D with 256K bytes of mainframe memory now costs $63,100, down 11% from its previous price of $70,900. The 512K-byte configuration has been repriced at $89,100, down 17% from the former $107,400.

The 768K-byte version is now $114,100, down 20% from $143,900, and the 1M-byte version costs $139,100, a 23% savings from the original price of $179,900.

The price reductions are effective immediately, Interdata said from headquarters in Oceanport, N.J. 07757.

Searcher Finds Flexibility

(Continued from Page 33)

min reader, the 90/30 system provided the firm with 50% more capacity and speed than the 3/10, Chismark said.

Chismark anticipates a system upgrade to add more disk in the future.

"When the system was installed, we were able to cut back from an eight-hour shift to five and a half hours," he recalled. However, because requests for processing from within for management reports have increased along with the number of searches performed, the system has gone back to the eight-hour shift.

Ordered in September 1976, the system was up and running by Jan. 1. More than 200 programs were converted to the system with the aid of Univac in less than three months.

"Previously, searching public records to identify judgments and liens was a time-consuming and tedious process. But computerization of the records has eliminated these problems," Chismark said.

"Our reports are more accurate because a computer search eliminated the errors that can occur in a manual search," he pointed out. "In addition, we conduct phonic searches in which the computer looks for names that sound the same as well as conventional searches for names with the same spelling."

Operated under the overall supervision of business manager Jeff Bope, computer operations are conducted by DP manager and programmer Mark Swanson, who directs a staff of three people.

To provide computerized judgment and lien services, Law Bulletin Title Services maintains a computer file of 700,000 names related to seven statutory years of data for any of 1.2 million parcels of Cook County real estate.

The data file is updated daily. Judgments and liens filed one day are microfilmed in the Cook County recorder's offices, punched onto cards and entered in the system so computerized searches for the data can be made the morning of the next day. About 400 to 500 judgments and liens are entered in the system every day.

When requests are made for judgment and lien searches, names of parties are entered in the system which prints out reports for each request. To ensure accuracy, the system uses an internally designed program to perform two separate alphabetic and phonic searches on each name.

The alphabetic search finds all names spelled exactly as requested, while the phonics search identifies names that are similar in sound to protect against misspelled or misrecorded entries.

Containing all pertinent information about any judgment or lien found to be of record, system reports are delivered within 24 hours following receipt of service requests. Copies of source documents are also made from microfilm and provided on request.

IF YOU HAVE AN ASCII TYPING OR CRT TERMINAL...

You Can Have Sophisticated Word Processing For Less Than $10,000

If you are using CRT or Diablo™/Qume™ terminals, you can add sophisticated word processing at a remarkably low price. The ACS SA-400 will transform your dumb terminal into a brilliant word processor with no complicated interfacing. Important features include:

- Composing and Editing Formatted Pages
- Industry Defined Automatic Proofreading
- Mainframe Communications and Unattended Printing
- Global Search and Replace (Bidirectional)
- Cut and Paste, Outlining, Personalized Form Letters
- Automatic Page Headers and Footnotes

Radio Shack Retails Z80-Based System

FORT WORTH, Texas — Radio Shack has introduced a fully assembled Z80-based microcomputer with keyboard, CRT terminal and cassette unit.

The TRS-80, which observers have expected for the last six months, retails for $599.95.

The unit comes with 4K bytes of read-only memory (ROM) and 4K bytes of dynamic random-access memory (RAM). The memory is internally expandable to 12K bytes of ROM and 16K bytes of RAM. A total memory capacity of 62K bytes is possible with the system.

The terminal is memory mapped and all graphics and alphanumerics can be controlled by commands in Basic, according to a spokesman. The unit also features cursor control and automatic scrolling.

When creating text, the terminal gives 16 lines of 64 characters, which can be software-selectable to 32 characters. The graphics capabilities permit 128 by 48 picture elements.

Radio Shack TRS-80

The microcomputer has a built-in 53-key integrated Ascii keyboard and an expansion port for additional memory and peripherals, he added.

The Radio Shack Level 1 Basic software resides in 4K bytes of ROM. It features standard Basic statements; floating-point arithmetic; numeric, array and string variables; graphics commands; and cassette save and load commands.

Special commands include "Clear Screen," "Set X,Y," "Reset X,Y," "Point X,Y" and "Formatted Print." The display is 12 in. diagonal.

There are five current software applications packages available from Radio Shack. Blackjack and backgammon, with instruction sheet and a single cassette, is free. A cassette folio for payrolls of up to 15 people wiht a manual and sample instruction sheet costs $19.95.

An education application, Math I, covers multiplication, addition and subtraction and comes with a teacher's guide. It is priced at $19.95 for a three-cassette portfolio.

A kitchen application consisting of menus, conversion tables, a computer directory and message center costs $4.95, and a personal finance application consisting of seven cassettes costs $14.95.

The microcomputer can be purchased individually for $399.95; the system is available at Radio Shack stores nationwide.

Micro Bytes

APL Interpreter Contest Features $1,000 Prizes

PETERBOROUGH, N.H. — Byte Publications, Inc. has begun "The Great APL Interpreter Contest" with one or more $1,000 prizes for winners.

Contestants are free to write interpreters for any microprocessors they choose, according to a Byte spokesman. Entries will, however, be judged on suitability for use on small systems with a minimum of 16K bytes of memory, as well as "program elegance" and efficient use of space.

Entries must be in the form of a publication-quality manuscript which describes the implementation of the interpreter and includes source code and object code, he said.

Contestants should also submit machine-readable source and object code in the form of paper tape or cassette tape. Entries should be postmarked before midnight Feb. 28, 1978.

Persons interested in entering the contest should contact Carl Helmers or Chris Morgan at Byte Publications, Inc., 70 Main St., Peterborough, N.H. 03458, in order to be included in mailings of further information of the contest's progress.

Digital Design Course Set

WASHINGTON, D.C. — A short course on practical digital design and applications will begin Nov. 5 at George Washington University here. The course is designed for electronics technicians, hobbyists and others who are interested in understanding and applying digital design techniques, acording to a spokesman.

The object of the course is to enable the student to develop skills for designing with digital circuits and to better understand the operation of digital devices. There will be greater emphasis on practical applications than on theory, according to the university spokesman.

The course, which costs $180, will be held Saturday afternoons through Dec. 17. Prospective students should contact the Director of Continuing Engineering Education, George Washington University, Washington, D.C. 20052.

Tylog Mailing Label Software Designed for 8080 System

MIAMI — Tylog Systems, Inc. has introduced a general-purpose mailing label software package for 8080-based microcomputers.

The Micro-Label System creates mailing labels and can be used for similar label applications, according to a spokesman. The system was designed for nontechnical personnel.

The software is formatted to run on an 8080 processor using dual North Star Computers, Inc., minifloppy disk drives and a pin-feed or tractor-feed impact printer. The software permits the label files to be printed in more than one sequence; error editing and restart capabilities are also provided.

Each master file can hold over 540 records, with multiple files being used for longer lists, the spokesman noted.

The program comes in seven modules including the Update module to add, change and delete to an existing master file or create a new file, the extract module, which creates a key file by name, Zip Code or Zip and name; and the Sort module, which sorts key files.

The Reorganization module reorganizes the master file and removes deleted records; the Print module prints mailing labels and restarts at any record; the Copy Module is used for general-purpose file copy; and the Read module was developed for general-purpose read and print.

The standard label format allows any length print line up to 132 columns with one to 20 labels across.

Program runtimes include an 8 sec maximum update response time, a 30 min maximum sort time, a 5 min maximum extract time and a 12 min maximum reorganization time, according to the spokesman.

Options include custom record formats, custom sorts and custom label height.

The standard software system costs $500 and options cost $40 each from the firm at 9805 S.W. 152 Terrace, Miami, Fla. 33157.

Infinite Micro Built With RCA 1802

MELBOURNE, Fla. — A microcomputer based on the RCA Comsac 1802 microprocessor unit (MPU) chip is available from Infinite, Inc. in either preassembled or kit form.

Features of the UC 1800 include built-in keyboard programming; digital hexidecimal display for address, memory contents and I/O port; front-panel control; 256-byte random access memory (RAM) externally expandable to 65.5K byes RAM or read-only memory (ROM); and a single power supply.

Software included with the UC 1800 contains Keybug, a keyboard handler and debug program for generating and debugging programs. Documentation includes over 200 pages of material that covers both hardware and software.

A software library of diagnostics, games and macro-building routines is also available, Infinite said.

The UC 1800, as a complete assembly with cabinet and documentation, costs $495. In kit form with complete documentation, it sells for $389.

The UC 1800HK hobbyist kit, which contains all but the "garden-variety parts," costs $129.95 and is intended for the experienced kit builder, according to a spokesman.

Infinite is at 1924 Waverly Place, Melbourne, Fla. 32901.

North Star MPU Has Floppy Disk Memory

BERKELEY, Calif. — North Star Computers, Inc. has introduced its Horizon microcomputer. Based on a Z80 microprocessor unit (MPU), the Horizon includes 16K bytes of memory, a disk controller with one or two Shugart minifloppy disk drives and full extended disk Basic, the vendor said.

A serial I/O port is included for connection to any terminal, with standard transmission rates, a spokesman added.

System options include additional disk drives, hardware floating-point arithmetic board, 24-line by 80-character upper and lower case CRT controller board and 16K memory board with parity check.

The controller board reportedly displays 480 by 250 resolution graphics on a TV monitor, the spokesman claimed.

The single-drive Horizon-1 sells for $1,599 in kit form and $1,899 assembled. The dual-drive Horizon-2 sells for $1,999 and $2,349 from the firm at 2465 Fourth St., Berkeley, Calif. 94710.

COMPUTERMANIA™

AN EXPOSITION OF MICROCOMPUTERS
FOR HOBBYISTS, BUSINESSMEN AND CURIOUS DP'ERS

ARE YOU MISSING SOMETHING?

If you missed the micros at NCC in Dallas, you may be in for a profound shock. There are a lot of very powerful $2,000 computer systems out there — would you believe a 74 megabyte disk and operating system for under $6,000?

Commodore came in first with their PET at $600 — a lot of computer. Then came Ohio Scientific with their Challenger II at the same price, but with some amazing features. Now Radio Shack has a $600 system, Z-80 powered, complete with video terminal, 4K BASIC in ROM, RAM, cassette system, and even a disk to come. You'll see all of these and a whole lot more at COMPUTERMANIA.

WILL MICROS KILL TIME SHARING?

Micros started out catering to the hobby market. Now they are aiming right at small business and there will be a lot of computer power selling in the $10,000 and under range — enough to make any small firm think hard before going to time sharing — and enough to get a lot of larger firms to use several microcomputers instead of time sharing.

You're not keeping up with your education if you miss COMPUTERMANIA.

MICRO GROWTH

A little over two years ago the first firm started in microcomputers: MITS. By last August there were about 50 firms, all small. Today there are over 500 firms making microcomputer systems, accessories, peripherals and software — virtually all of them new companies.

Since projections are that the micro field will soon be larger than the mini and maxi sales, perhaps it is time for you to check what is happening. Sales are doubling about every four months, with no slow down in sight — just in case you may be thinking ahead.

TECHNICAL SESSIONS

In addition to technical talks and demonstrations of the newest micro techniques and systems, there will be a talk on how to open and manage a computer store and one on how to make big money in microcomputing.

COME EARLY

Bring the little coupon from this ad and save $2 on your registration (only $10 with the coupon). This show is being heavily advertised on radio and TV to bring in the businessmen, so it could be sold out. Avoid frustration by coming early.

ORGANIZER

COMPUTERMANIA is being put on as a service to this new industry by Kilobaud, the leading microcomputer magazine.

If you have any questions call *Kilobaud* at (603) 924-3873. Subscriptions are $15 per year: *Kilobaud*/Peterborough NH 03458

Board Game, Micro Meet In 'Code Name: Sector'

SALEM, Mass. — The microprocessor and the traditional board game have met in the form of Parker Brothers' game — "Code Name: Sector."

In the game, the players' opponent is the micro that governs the movements of the submarine rather than those of fellow players.

The object of the game is to sink a submarine whose movements are guided by a Texas Instruments Corp. 0970 series chip.

Distance Calculated

The distance between a player's destroyer and the submarine is calculated after each player's move and shown on a small display screen. The screen gives only the distance, not the direction, by which the two ships are separated.

When the submarine is sunk, the screen says "sub," a spokesman explained.

The submarine moves in a straight line until it approaches shore and then rebounds, heading in another direction. It moves one square every time a player shifts the position of his destroyer. The game accommodates four players.

Those wanting a more difficult game can initiate the "evasive" mode which allows the submarine to change directions randomly. There are 4,800 possible undersea positions, and the submarine starts at a different one each time.

When a player feels he has found the submarine, he selects one of three depths at which to fire a charge. If the incorrect depth — or one not selected by the microprocessor — is chosen, the submarine fires at the destroyer, thus giving it a new position on the chart.

Players select the direction in which they move and can move up to nine spaces by pressing a button repeatedly until nine is indicated on the screen.

They then press an enter code and the micro assimilates the new position and divulges the distances between that particular ship and the submarine.

Teaching Mode

There is also a teaching mode, in which the submarine is in a preset position.

The game runs on either a 9V calculator battery or household current and a battery eliminator.

Prices are set by individual stores. However, a spokesman said prices are expected to range from about $28 to $45.

The game will be available in the fall.

MICROCOMPUTING CLASSIFIED EXCHANGE

This special classified section in solid (non-display) format is designed for people who are working with or interested in microcomputing. Through it, you can buy, sell or swap equipment software or services; contact people with similar interests; start clubs; disseminate information; look for game partners; or send messages to other individuals. As the number of ads increases, this section becomes more useful; so we've tried to make ad placement as simple and inexpensive as possible. Details are as follows:

Ordering: The attached form will serve as the simplest way, we feel, to place your ads in Microcomputing Exchange. Please do not use it for other classified sections of Computerworld. They are display format and have different procedures and rates. Publisher reserves the right to refuse ads for this section, to limit the size of ads placed, and to limit the number of ads placed by any one person or company.

Payment: Must accompany your order. No exceptions. Your check will be accepted.

Copy and Closings: Deadline for copy to be in our hands is Friday, ten days preceding Monday issue. All copy must be submitted in writing (no copy taken over the phone), clearly typed or printed. We cannot be responsible for errors in printing made from illegible copy.

Rates: 80¢ per word. All words set in same size and typeface, up to first five words may be boldface. In making word counts, include name and address. Name of city (New York) or state (New Jersey) counts as two words. Zip code or phone number (including area code) counts as one word. (Publisher reserves right to omit zip code and/or abbreviate words if space is tight.) Count each abbreviation, initial, single figure or group of figures or letters as a word. Symbols such as RAM, CRT, etc. count as one word. Hyphenated words count as two words. No commissions paid to agencies.

Box Numbers: Are available at $5.00 per insertion. Send replies to box numbers to:

The New PCMs — Part 3

Mainframers Not Seen in PCM Arena

By Molly Upton
CW Staff

NEW YORK — Established mainframers are unlikely to join the rush toward the plug-compatible mainframe market, according to computer industry securities analysts here.

And these mainframers should remain relatively unaffected if the plug-compatible manufacturers (PCM) and IBM engage in pricing contests, they indicated.

Control Data Corp. had unique motivations for entering the PCM mainframe business, they all agreed, such as a relatively small market share in mainframes and a bustling plug-compatible peripherals business.

In addition, James Blair, first vice-president of White Weld & Co., pointed out, CDC did not incur the development costs of the machine.

There was some disagreement about the source of the next entrants in the plug-compatible mainframe arena. Harry Edelson, vice-president of Drexel Burnham Lambert, Inc., said there probably will not be any more Japanese firms, but added there could be more American semiconductor firms entering the fray.

However, William Easterbrook of Kidder Peabody & Co., Inc., thinks Japanese firms such as Toshiba and Nippon Electric Co. (NEC) might be more likely to enter sooner than American semi firms.

Fujitsu and Hitachi are, for all practical purposes, included in the PCM market since Fujitsu makes much of the Amdahl Corp. CPU and Hitachi and Itel Corp. have reportedly agreed to provide a machine.

The mainframers don't have to play the PCM game because they are doing very well under the existing groundrules, Edelson remarked.

IBM is by no means finished with its attempts to make the PCM mainframers look like traditional competitors which have their own lines of software and peripherals, he continued.

The IBM 3033 was an attempt to discourage firms from rushing to join the PCM market, but it didn't wholly succeed, he said.

In the future, Edelson expects IBM to put firmware in its peripherals as well as its mainframes. Thus the PCMs would be unable to hitch their CPUs to IBM peripherals and software. The PCMS have been offering complete systems relying on IBM software and peripherals.

This is the last article in a series that attempted to examine and predict where plug-compatible mainframe manufacturers are going and what IBM is likely to do in response.

Blair feels the concept of firmware is more talk than reality. It's a conversation piece for the next three to five years, but it does make the user think twice.

Purchasers of PCM mainframes are getting a price/performance kicker through their hardware, but it remains to be seen whether they will forfeit a price/performance mid-life kicker through software, by having a PCM machine, Blair observed.

Easterbrook said mainframers that provide both hardware and software will have a distinct profit advantage over PCM. Central to his thesis is his expectation that mainframers will increasingly focus on software, rather than hardware, as the profit generator.

They will control the interfaces linking the hardware and the software, so they will be in a good position to leverage up the profitability, he explained.

In addition, the incremental cost of software is zero, which makes the economy-of-scale argument even more attractive if the vendor has a large base for a market, he indicated.

On the subject of the Japanese, Easterbrook indicated they have traditionally had two shortcomings: lack of worldwide marketing and support staff and lack of strength in software.

If hardware were the basis for

CI Notes

Microdata Eyeing CMC Overseas

IRVINE, Calif. — Microdata Corp. has entered into a preliminary agreement to acquire the Computer Machinery Company (CMC) firms in Great Britain, France, Germany, the Benelux countries, Sweden, Denmark, Portugal, Spain and Italy.

Mirodata would pay about $11 million for the purchase, most of which would be in cash and the remainder in the form of convertible debentures and common stock.

Consolidated revenues of the CMC companies in the year ended Dec. 31, 1976 were about $50 million. Microdata had total revenues of $31.7 million in its fiscal year ended Aug. 31, 1976.

Threshold Gains Patent

WASHINGTON, D.C. — Threshold Technology, Inc. of Delran, N.J., has been awarded a patent for a device that improves the clarity of human speech so people can talk to computers.

The device allows an operator to pronounce numbers or spoken orders by taking into account breath noises, such as the tendency to exhale at the end of an isolated word and to inhale at the beginning.

DBMS Services to Star In RCS Revenue Scene

By Toni Wiseman
CW Staff

MENLO PARK, Calif. — The market for data base management systems (DBMS) services is one of the most important — and fastest growing— segments of the remote computing services (RCS) industry.

By 1981, over one-quarter of RCS revenues will come from DBMS services, resulting in an average annual growth rate of 36% betweeen 1976 and 1981.

Those predictions were made in a recent report by Input, a market research firm here.

"The ability for nontechnical (in a data processing sense) people to use DBMS services with minimal help from the vendor will prove to be the major opportunity area for RCS vendors," Input said.

The firm projected the market for DBMS services to nontechnical groups in large and very large organizations will grow from under $70 million per year in 1976 to over $530 million by 1981.

By Input estimates, large-scale service expenditures will rise from $19 million in 1976 to $29 million in 1981, a 9% average annual growth rate.

The expenditures of nontechnical large users will grow an average of 51% annually, from $67 million to $533 million, while technical usage jumps, 22% from $90 million to $242 million during the five-year period, In-

Market Exit Forecast for Some Mini Makers

By John P. Hebert
CW Staff

WOBURN, Mass. — The capabilities of minicomputers "will be just enormous" in the future, but some of the present minicomputer vendors may not be supplying them, according to a speaker at the recent conference here.

Those in the computer industry will see and possibly be affected by the exit of some of the less established minicomputer vendors as they reassume the role of component manufacturers, according to Leonard Farano, executive vice-president of Gambit Management Strategies, Inc.

This migration from the minicomputer ranks will be made by those companies not willing "to accept the role of being dwarves" — a role forced by more competition from the mainframe vendors, Farano said.

The minicomputer has enjoyed and will continue to enjoy a wide success because it helps the user do a better job by tying him to needed data — it brings the user closer to the information, he said.

It doesn't matter that that machine is a minicomputer, Farano said. It could easily have been a mainframe, except that mainframes have too much power and cost too much.

Communications is still "too long a way from being perfect" to allow the next best thing, he added.

Moving on to other forecasts, Farano predicted users will see a leveling in the price of core memory in the near future, although semiconductor memory prices will continue their downward cost trend.

Disk drives are merely electromechanical devices whose density will quadruple over the next four years, but whose prices will only drop by 50%, Farano said.

Terminal and printer prices will also level off because the technology has reached a practical and optimum level in terms of the end user.

And while computational costs have dropped tremendously, the cost of communications has only decreased 2% annually in the last few years, he noted.

Communications will be the single most important factor in the rise of the minicomputer, according to Farano, who asked why anybody would "mess with the telephone company" when they could have a local data base.

But, in view of the advantages of minicomputers, "there are many DPers among us [who] want to hang onto the things of the past — such as large compilers and a data base," Farano said. Minicomputer vendors, like automobile manufacturers, have crammed all the "big car features into compacts" because people want luxury regardless of economy.

Operating systems have gotten larger and marketing terms such as "virtual storage" only serve to keep users conscious of equipment obsolescence, he said.

"Only now are we seeing operating systems which help users avoid monstrous conversions" when they need more capabilities, Farano said, referring to the nonexistence in the past of "upward compatibility," another marketing term.

At the minicomputer end of things, vendors have not had the end user in mind during systems design. The user wants the computer to be a reliable tool to be used purely as a utility, like the telephone. "That's the way it can be successful," he remarked.

Farano said he views the minicomputer manufacturers as "ironmongers, when we would only like to see them make good operating systems."

DBMS Services to Star in Revenue Scene

(Continued from Page 39)

put forecast.

Small users will also show considerable increases in use; increasing their expenditures from $26 million to 1976 to $147 million by 1981, the report said.

"Because of the ways of packaging DBMS services, there is high 'value-added' and profitability potential for vendors in their use," Input stated, noting the fastest growing of these packaging strategies is the development of prepackaged applications by vendors using their DBMS services, a market which accounted for less than $10 million in 1976 but which should reach over $240 million in 1981.

Rapid Implementation

"Of fundamental importance to computer services vendors, users are becoming aware that no one [DBMS] will satisfy all their requirements. Further, the desire to rapidly implement applications to access and use data bases is spreading through organizations like wildfire.

"In-house DP departments are finding meeting this demand extremely difficult," the report observed.

The improvements in price/-performance of processing and storage are reducing the importance of inefficiencies in hardware use when a DBMS is employed, the study noted.

"However, poor performance in standard DBMS, such as [IBM's] IMS, will be ameliorated by conversion of key code routines into firmware through shifts in the HFS boundaries," Input stated, adding that future mainframes will have specialized processor functions for DBMS.

Marketing Strategies

The largest and fastest growing DBMS services are all proprietary, the report said, noting only one of the seven RCS vendors with more than $5 million per year in DBMS revenues uses a third-party DBMS. McAuto uses IBM.

Input suggested five product marketing strategies that vendors can employ in their "value-added" campaign:

- "Self-help," in which the vendor adopts the commodity approach of putting up a DBMS, usually a third-party one, and lets the user go it alone.
- "Language," in which the vendor focuses on customers who intend to do much of the development work themselves.
- "Tool," in which the vendor sells ongoing analytical and inquiry — rather than development — capabilities.
- "Custom programming," in which the vendor uses the DBMS and its own programming staff to develop and operate an application for a customer.
- "Prepackaged applications," in which the vendor uses its DBMS services to develop generalized applications programs which are then implemented for individual customers with modifications.

Not for Mainframers . . .

(Continued from Page 39)

profitability, then it could be argued the Japanese firms would do very well, he conceded.

None of the analysts were very concerned about the effects on the other mainframers of a price war between IBM and the PCMs.

IBM would be affected, but the other makers have a 50-50 chance of remaining unscathed in the near term, according to Edelson. They would be affected only if IBM decides to thwart the competition by cutting prices more than it normally would, he said.

There is a great degree of demand elasticity for large computers, he continued. For instance, if lower prices increase the demand by 1% or 2%, that would be sufficient to keep everyone's growth intact, he said.

It looks as if all the mainframers will keep pace with IBM's pricing because they can't afford to lose market share. It's a matter of how much effect such a move will have on one's margins, he said.

So far, elasticity of demand has compensated for the reduced margins, he observed.

Blair is also impressed with the demand elasticity. PCMs are not displacing previously installed machines, he noted, but represent additional processor power, contrary to the situation six or seven years ago.

The demand stems from the trend to decentralization, Blair said, adding this represents opportunities for the other mainframers as well.

At least temporarily, Blair is bullish on PCMs. The price elasticity has created such a backlog for IBM that the ability to deliver quickly is more important than the price of a machine, he said.

International News

Turn to Packaged Software

South African Users Tighten Belts

Special to CW

JOHANNESBURG, South Africa — Faced with an economic recession and the recent increase in import duties on computers, computer users in South Africa are turning to service bureaus and packaged software to increase their productivity. In addition, users are replacing large mainframes with a number of small computer systems to reduce costs and gain efficiency.

According to local experts, there are about 1,500 general-purpose computers and about 2,500 minicomputers in South Africa with total installed value of about $600 million.

The commercial and industrial organizations using these systems have been under budgetary pressure caused by the current economic recession, attributable to reduced international investment in the country and lower export levels.

The recession is attributed by local businessmen to the recent slowdown in economic growth in Europe and the international political and economic pressure being applied to South Africa from countries which disapprove of that government's racial policies.

To maintain DP output levels at little or no budgetary increases, and in some cases to achieve budgetary decreases up to 10%, DP managers have been turning to performance monitors, Sort and other utility packages and increased use of outside services to increase their departments' productivity.

Software sellers interviewed here indicate sales are up 30% to 40% so far this year. Also, programming and systems consultants and service bureaus report substantial increases..

In contrast, mainframe makers have been experiencing a difficult time. IBM, after seven years of good business growth, was substantially off its order and revenue targets for 1976, and informed sources say DP sales continue to be slow.

Escom, an electrical utility, recently ordered 30 ICL 2903 small systems to distribute preparation of electricity bills, replacing a number of IBM mainframes in the process.

IBM has about 50% of the South African computer market, while ICL, the second leading supplier, has 25% of the market. The rest is distributed among Univac, Control Data Corp., NCR & Burroughs.

The level of computer sophistication is considered quite high in South Africa. Because the principal cities — Johannesburg, Capetown and Durban — are quite distant from each other and telecommunication costs are attractively low, South Africa operates some of the most advanced and sophisticated data communications in the world.

Opposition to South Africa's racial and separatist policies in the U.S. has caused U.S. computer makers some uncomfortable moments.

IBM's chairman Frank T. Cary was closely questioned at the recent annual meeting on his company's operations in South Africa. He reiterated IBM's position that it cannot impose U.S. policy through restricting use of its computers in other countries, although it would not sell a computer which it knew was intended to be employed for illegal or immoral purposes.

Presumably, local community standards apply in interpreting these judgments. A recent U.S. visitor noted the current largest advertiser in the DP press in South Africa is the Anglo-American Corp., a major gold mining firm.

It is using four-page spreads to recruit personnel for the development of a Human Resources Information System, to be implemented on two IBM 370/158 computers. This system, which will employ some 300 on-line terminals, is described as enabling the "management (in all senses) of the migratory black work force of over 130,000."

Spring Expo in Paris

PARIS — The U.S. Department of Commerce is sponsoring "Printemps Informatique," an exhibition for computers and related equipment to be held at the U.S. Trade Center, here from March 14-17.

Recently completed market research indicates France is an excellent market for American computers and related equipment. French expenditures for computers and peripheral equipment exceeded $1 billion in 1975 and are forecast to surpass $2 billion in 1980.

Continuing demand for new information-processing hardware by business and government should support an average growth of 16% a year in this market during 1975-80, Commerce said.

Imports, which have accounted for almost half of the DP equipment purchased in France in recent years, are expected to maintain their overall market share and are projected to rise above the $1 billion mark in 1980 to represent about 47% of the total market.

For information, contact Helen Burroughs, U.S. Department of Commerce, Room 6318, Washington, D.C. 20230.

European CPU Spread Seen Stable

By Molly Upton
CW Staff

LONDON — The distribution of various brands of CPUs among industry sectors in Western Europe has remained nearly constant over the past two years, according to a study in IDC Europa Ltd.'s *EDP Europa Report.*

Manufacturing has remained the largest user sector throughout Europe and showed the fastest growth in the Benelux countries and in Switzerland, the report said.

IBM had the highest percentage of its base in the process and durable goods manufacturing sectors — 46%.

Burroughs had 28% of its base in manufacturing, Control Data Corp. 15.7%, Honeywell-Bull 15%, ICL 34%, NCR 33%, Univac 39% and Siemens 36%, according to *EDP Europa.*

In the Benelux countries the distribution of computers in the manufacturing areas jumped from 33.7% to 45,9%. In Switzerland the jump was from 35.6% to 40.1%.

Although Scandinavia's process manufacturing grew from 14% to 19.6%, durable goods manufacturing's share of computers dropped from 25% to 16.3% for an overall decline — from 39% to 35.9%.

In the UK, expenditures for computers and peripherals should grow relatively sharply in the banking industry by 1980, according to the report.

For instance, from the 1974 estimated outlay of $58 million, UK banking will probably spend $140 million in 1980. As a percentage of various segments' DP expenditures, banking's share will rise from 8.5% to 11.5% to rank third behind manufacturing and government.

Although expenditures for manufacturing will continue to increase, the percentage will decline from 28.5% to about 21.9%, the report noted.

Manufacturing expenditures for DP in the UK were $195 million in 1974 and are projected to be $266 million in 1980, according to *EDP Europa.*

Government will continue to hold its second place share with 14.5% in 1980 with equipment valued at $176 million.

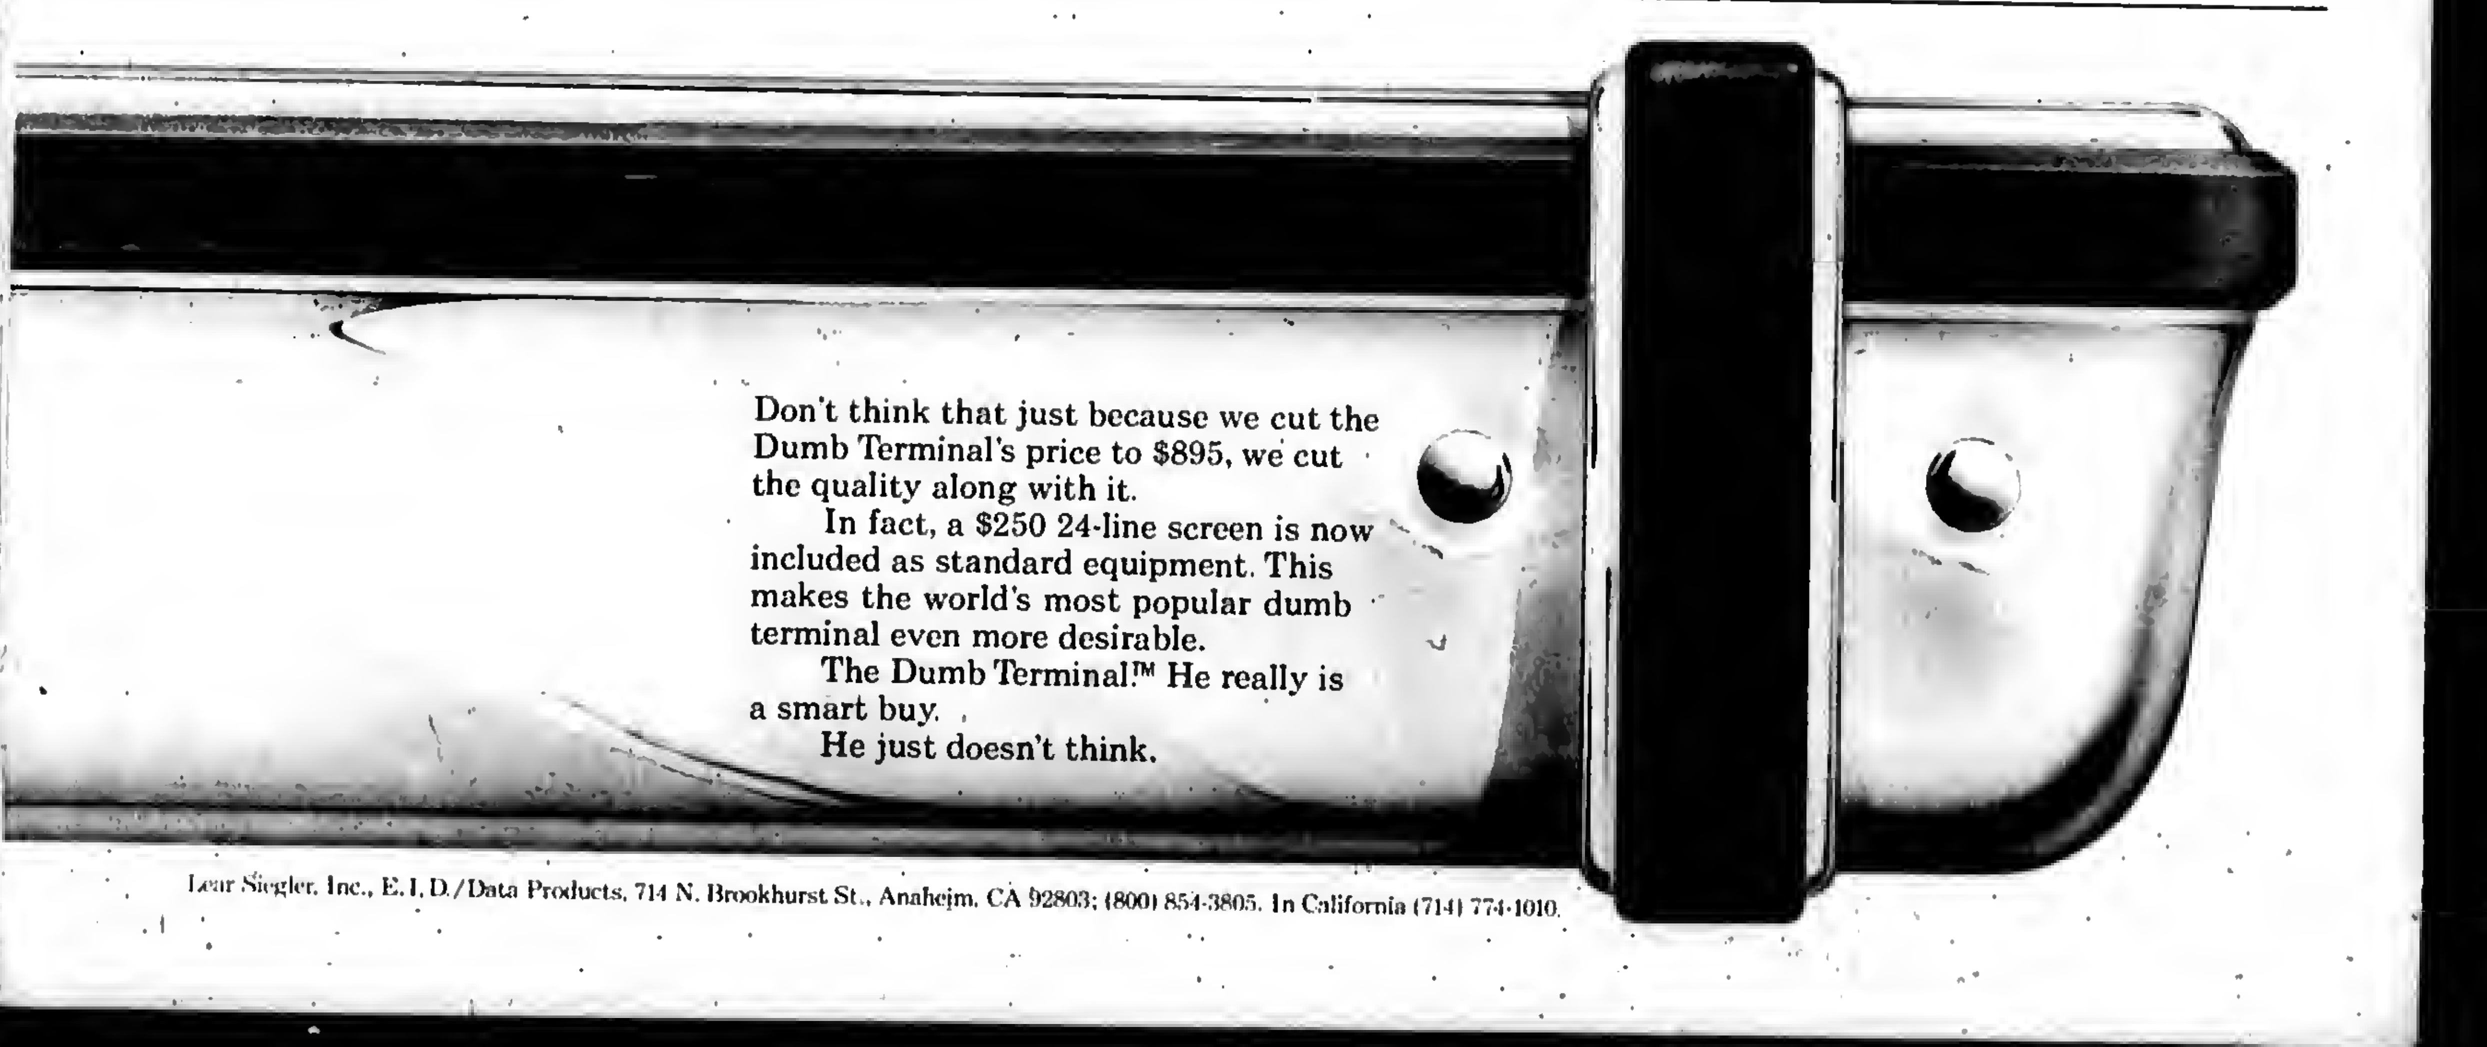
Commerce Slates Expos

WASHINGTON, D.C. — The U.S. Department of Commerce will stage a tandem pair of exhibitions of electronics production and test equipment in France and Germany in November.

The shows are an effort to help U.S. manufacturers increase their share of a Western European market.

The first show will be held Nov. 14-17 at the U.S. Trade Center in Paris. The second will be Nov. 22-26 at the international "Productronica" congress and exhibition held biennially in Munich.

Additional information is available from the Bureau of International Commerce, Room 1015-C, U.S. Department of Commerce, Washington, D.C. 20230.



Don't think that just because we cut the Dumb Terminal's price to $895, we cut the quality along with it.

In fact, a $250 24-line screen is now included as standard equipment. This makes the world's most popular dumb terminal even more desirable.

The Dumb Terminal.™ He really is a smart buy.

He just doesn't think.

Data 100 Boosting OEM Sales, Production

By Molly Upton
CW Staff

MINNEAPOLIS — Data 100 Corp. expects its OEM operations to contribute about $20 million in revenue in fiscal 1977, according to John Roy, general sales manager for OEM.

OEM sales account for between 70% and 75% of the units marketed to the OEM and the rest are consumed by Data 100 end-user products, agreed Roy and Gerry Kaplan, director of marketing support for OEM.

In 1976, Data 100's revenues totaled $121.9 million, of which $75 million came from sales, the annual report indicated.

Data 100's principal OEM product lines are 5M- and 10M-byte cartridge disk drives and line printers from 62- to 600 line/min.

The firm is well positioned to enjoy the projected OEM market spurt in printers in the 60- to 250 line/min range, Roy indicated.

Market surveys forecast these line printers should grow from 4,000 unit/year in 1976 to 18,000 unit/year in 1980.

Began Entry in '74

Data 100 began its entry into the OEM market in 1974 as it sought to vertically integrate its production and also to diversify, Roy said.

For Data 100, the OEM area represented a different market, one which was not lease-dependent and not dominated by IBM.

Late in 1974, it acquired Odec in Warwick, R.I., which had line printers from 62- to 300 line/min. Then in September 1975, it bought Iomec, which had a wide range of product lines. Data 100 sold some of these lines, such as the paper tape and Portaverters, and discontinued others, Roy said.

The disk products were transferred to Minneapolis earlier this year. In July, the firm produced more drives than Iomec had in a month, he said.

At Warwick, the printer line was revamped and new products were brought out. The product line has "changed dramatically," principally through building in reliability and "getting out of the product what was potentially there," Kaplan said.

"We've tried hard to establish ourselves as a quality supplier," which means providing service and various interfaces, Roy indicated.

For example, Data 100 will provide field service for its printers.

Kaplan explained that often customers are not initially real OEMs with their own service force, etc., "so we try to offer more in support."

Non-OEM Products

There are some products Data 100 manufactures but does not offer to the OEM, such as a CRT and the mini used in its remote-batch systems.

Roy said the firm draws lines at what it feels it can effectively offer in the OEM marketplace.

In the disk drive area, the firm has seriously looked at higher capacity drives, Roy said. One thing that has held it back is the lack of unanimity in the industry on what technological approach to take, he said.

He conceded the firm could lose market share by its lateness in developing such a product. But, he added, just as Data 100 got into the disk business through an acquisition, the same approach might be a viable way to enter the larger capacity disk drive market.

size of the printer plant, and the addition is expected to be completed this year, Kaplan said.

Roy said Data 100 is looking at the strategy of offering a full line of printers. However, the low-speed arena is moving toward lower prices, which could mean diminishing returns, he observed.

Data 100 is less enthusiastic about the low end than it is about the speed range of 100- to 1,000 line/min, he indicated.

The boom in printers in the 100- to 300 line/min range is a reflection of the increased demand for small business systems. Several other firms, such as Centronics Data Computer Corp. and Dataproducts Corp., recently introduced products in this range, Kaplan observed.

"Clearly they're moving in the direction we've been going in the last three to five years. Obviously this will cause us to do some things to be competitive, but this is the area in which we're dominant."

Data 100 is already starting to feel the positive effects of increased competition, he indicated. For instance, other firm's customers are looking at all offerings — including Dta 100's — in that particular speed range. "It's opening up some doors," he added.

'This Year I'm Going to Relax and Forget About the Computer Business! Open Me a Bottle of Data Processing.'

The best key-to-disk system isn't the best known...

but it will be.

With the many key-to-disk systems offered today, selection of the one most suited to your dispersed processing requirements isn't as easy as market share charts might suggest. There is only one system that offers you hardware and software designed to perform all data entry and front-end processing in the most economical manner. That is the Cummins Key/disk System.

And the word is getting around. Since introducing our unique KeyScan® System for combination OCR and key-to-disk applications, our key/disk capabilities have so impressed the industry, that today almost 40% of our installed systems are key/disk only. The fact that many of these users recognize that an OCR scanner can be added to the system if an application arises, was a minor consideration. The primary selection criteria were software, service, cost and ease of implementation and operation.

If you'd like to improve your data entry operation, do what so many others are doing and check out the Cummins line of dispersed processing systems.

Cummins Key/disk

Computer Professionals...

Your career is 1/3. Your life is 2/3.

You'll all like NCR-Wichita.

We provide a state-of-the-art challenge in realtime architecture, develop network design and communication control for distributive processing in a revolutionary data processing minicomputer environment. Here you are given the chance to create and are treated as the unique individual you are. In our metropolitan location, the old west hospitality still prevails. In the midst of modern shopping centers, great restaurants, theatre groups, 52 parks, a solid school system and an opportunity for continuing education at three state universities. You can see the night sky like you have never seen it before and if you like outdoor sports, you will find this location gets your muscles working up to par. The people are friendly, the air clean, the water pure and there is plenty for all. Some of our opportunities are:

COMPILER DESIGN PROGRAMMERS

Serve as a team member for design development and testing of APL, BASIC, FORTRAN, COBOL, RPG, Compilers.

OPERATING SYSTEMS

Senior level Analyst with minimum of 6 years experience in minicomputer based interactive systems development. Responsibilities will include system architecture for an interactive system currently under development as well as being a major contributor to system enhancement for other development projects.

DESIGN AUTOMATION ENGINEER

Five years experience, scientific programming and BSEE. Develop and enhance logic simulation, test generation, P.C. layout aids and automated documentation systems.

WE'RE WORTH AN EXTRA-SPECIAL LOOK...

An Equal Opportunity Employer M/F

8K Eproms Bow

SANTA CLARA, Calif. — Electrically reprogrammable read-only memories in 8K bits are available from National Semiconductor Corp. for $32.75 each in lots of 100.

The MM2708 is a 24-pin NMOS device with a transparent lid. It is organized into 1K, 8-bit words, features typical programming speeds of 100 sec for all 8K bits and maximum access time of 450 nsec, the firm said.

The bit pattern of the MM2708 is erased by exposing the transparent lid to ultraviolet light, and a new pattern can then be written into it, the firm added.

National Semiconductor is at 2900 Semiconductor Drive, Santa Clara, Calif. 95051.

Microcosm

Micro Developers Get Expanded Support

BEAVERTON, Ore. — Tektronix, Inc.'s 8002 Microprocessor Lab enables developers to work with the 8-bit Intel 8080, Motorola 6800 and Zilog Z80 micros as well as with Texas Instrument's 16-bit 9900.

The 8002 provides an operating system which includes a text editor, assembler software for the selected micros and control, command and storage instructions, the firm said.

With the same development system users can evaluate different micros for a single application or several projects with different micros, Tektronix added.

The 8002 cuts debugging time and provides for interaction of hardware and software, thus helping eliminate finger pointing between the hardware and the software, a spokesman said.

The basic unit sells for $9,950 and includes a processor with 16K of system memory, 16K of progam memory and a dual floppy disk unit as well as two assembler software packages.

Options include real-time-in-prototype testing, hardware debug with break-points and 8-channel logic analysis.

Other options are a software-driven Prom programmer and up to 64K 8-bit words or 32K 16-bit words in additional program memory, the firm said.

A minimum software development system with a thermal printer costs around $12,000, while a full system with CRT and printer is around $22,000, a spokesman said.

The 8002 is supported by the Tektronix field service organization.

Tektronix Lab Instruments Division, Logic Development Products may be reached through P.O. Box 500, Beaverton, Ore. 97077.

National Semi Looks Overseas

SANTA CLARA, Calif. — National Semiconductor Corp. has unveiled four CPU and memory cards with standard Eurocard size and bus configuration for use with the firm's SC/MP low-cost development system (LCDS).

The units allow fast construction of 8-bit SC/MP microprocessor systems destined for the European market, the firm said.

The cards are 160mm by 100mm and have 64 edge connectors.

The ISP-8C/100(E) SC/MP CPU card costs $250 in single quantities. The ISP-8C/004(E) RAM costs $225 and the ISP-8C/004 card with empty ROM/ PROM sockets is $125 each.

The ISP-8C/004P(E) card with 4K words of memory is $525 in unit quantities.

National Semiconductor is at 2900 Semiconductor Drive, Santa Clara, Calif. 95051.

I/O Units Added

SANTA CLARA, Calif. — Intel Corp. has added three analog I/O subsystems and an optically isolated digital I/O subsystem to its SBC 80 single-board computer family.

The analog I/O boards are program- and pin-compatible for the same functions, and all the subsystems interface directly with the SBC 80 system bus.

The SBC 732 analog combination I/O board with 8/16 inputs and two D/A conversion channels costs $1,195.

The SBC 711 analog input board with 8/16 inputs costs $750.

The SBC 724 analog output board with four D/A converter channels and the SBC 556 optically isolated I/O board each cost $395.

Intel's OEM Computer Systems Group is at 3065 Bowers Ave., Santa Clara, Calif. 95051.

AMI Has Vmos RAM

SANTA CLARA, Calif. — American Microsystems, Inc. (AMI) is offering a 45-nsec, 1K by 1 bit static random-access memory (RAM) made from the V-groove metal oxide silicon (Vmos) LSI technology which, according to the firm, is price-competitive with bipolar devices.

The S4015-3 device costs $6.20 in plastic in lots over 100 from AMI at 3800 Homestead Road, Santa Clara, Calif. 95051.

Wintek Lowers Prices

LAFAYETTE, Ind. — Wintek Corp. has lowered the price of its 16K-byte Wince random-access memory (RAM) module to $399.

Other prices on the 6800 modules on industry-standard 4.5-in. by 6.5-in. circuit boards are $339 for 12K, $277 for 8K and $199 for 4K from Wintek Corp., 902 N. 9th St., Lafayette, Ind. 47904.

OEM Products

SLI Introduces Disk Drive With Winchester Heads

WOODLAND HILLS, Calif. — SLI Industries has announced the Sli Fox disk drive, which it said utilizes standard Winchester heads and media.

The unit includes deck plate, spindle, integral air filtration system, printed circuit board for electrical connection feed-through, disk cover and rotary positioner.

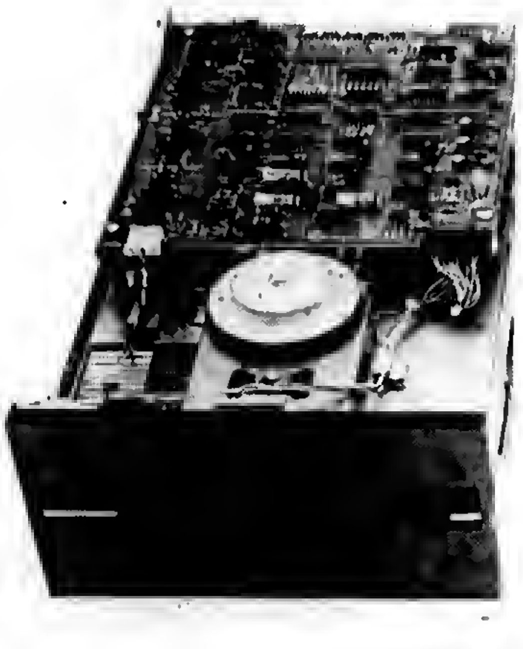
One to four disks can be mounted on the unit to allow a maximum of 70M bytes of unformatted data for each device, the firm said. The average access time is 40 msec.

SLI Industries said it has developed a standard set of servo electronics to support this unit and has its own servo writing capability available in preproduction or production quantities.

The Sli Fox costs $550 in OEM quantities from 21040 Victory Blvd., Woodland Hills, Calif. 91367.

Sli Fox

IBM-Compatible Disk Bows



ANAHEIM, Calif. — An IBM-compatible double-sided floppy disk drive has been introduced by General Systems International, Inc.

Called the FDD 200, the drive's capacity is 1.6M bytes, unformatted, the firm said. Electronics necessary to perform data transfer using only the interface-specified control commands are included.

A software interlock, which guards against operator error during data transfer, adds about $25 to the drive's price, which is in the low $400 range for OEM quantities.

The firm is at 1440 Allec St., Anaheim, Calif., 92805.

EMM Has Core For Rugged Sites

CHATSWORTH, Calif. — Electronic Memories and Magnetics Corp.'s (EMM) Severe Environment Products Division has unveiled the Sems-14, a core memory with a 32K by 18-bit basic module that stores 655K bits of data.

Operating speeds include an access time of 250 nsec and a cycle time of 600 nsec, the firm said.

Temperature range is -55°C to +85°C. Dimensions for each module are 6.4 in. by 9 in. by 1.4 in.

Bulk Memory Unit

A bulk memory unit can be concurrently developed to contain eight Sems-14 modules, power supply and interface circuitry and provide 256K by 18 bits of mass storage, EMM said.

The quantity price is $9,900 from the Severe Environment Products Division, 20630 Plummer St., Chatsworth, Calif. 91311.

GSI Has Autoloader For Floppy Diskettes

ANAHEIM, Calif. — General Systems International, Inc. (GSI) has introduced an automatic loader of floppy diskettes for use with its FDD 110 drive during certification and initialization processes.

The Model H155 horizontal autoloader permits processing of up to 30 diskettes without operator assistance, GSI said.

Data Transfer

The H155 can separate accepted and rejected diskettes into two bins. It can also be used for data transfer from cards, cassettes or tape to sequential diskettes for other tasks which require more memory than a single diskette can contain, the firm said.

Cycle time to load and unload the FDD 110 is less than 1 sec, a spokesman added. In single quantities, the H155 costs $3,500 from GSI at 1440 Allec St., Anaheim, Calif. 92805.

COMPUTERWORLD INDEX

SUBSCRIBE TO THE 1977 COMPUTERWORLD INDEX AND GET SIX MONTHS OF REFERENCE INFORMATION FREE.

The new Computerworld Index, published quarterly and cumulative, is an invaluable reference tool for organizations that have a need-to-know about what's going on in the computer world.

The first issue of the Index for example, covers the last six months of 1976, and it includes more than 4,000 entries by subject, author and name of any company mentioned. It breaks topics down into highly usable and convenient categories:

- There are entries by *product or service*, like *PRINTERS*, which has 37 entries in the six-month period covered; or *LEASING*, which has 10.
- There are entries by *industry*, like *INSURANCE*, under which there are 17 entries for various stories on the use of computers in the insurance industry.
- *Types of computer applications* is another way you can look something up in The Index. The category *INVENTORY SYSTEMS*, for example, has 21 entries.
- *Regulatory*, security and *social issues* are also indexed. There are 34 entries under *PRIVACY*, 10 under *PRIVACY ACT* and 9 under *PRIVACY PROTECTION COMMISSION*, for example.
- The Index also makes it easy to look into *legal aspects of computer use* with categories like *LITIGATION*, which has 24 entries in the last six months of 1976.
- Even *foreign countries* are indexed. The category *JAPAN*, for example, has 9 entries.
- ... and there are *others: KIT COMPUTERS* (the kind you build yourself) are the latest thing, and The Index shows 5 entries. *POINT-OF-SALE SYSTEMS* has 14 entries ... and there's much, much more.

Company Names, for example, are a very important part of The Index. Looking under IBM, we find *ten* categories:

- IBM GENERAL
- IBM LITIGATION
- IBM SOFTWARE
- IBM SYSTEM 3
- IBM SYSTEM 7
- IBM HARDWARE
- IBM PRICING
- IBM POLICY
- IBM SERIES 1
- IBM SYSTEM 32

Our special, no-risk offer:

Subscribe to one year of the Computerworld Index (4 quarterly issues, published three months after each quarter ends and cumulative) at the regular rate of $150; and we'll send you the Index for the last six months of 1976 FREE. In addition, we'll give you ten days to look over the 1976 Index AT NO OBLIGATION. Should you decide it's not what you need, just return it to us marked "cancel" and we'll cancel your subscription.

Computer Systems Specialists

Lockheed announces challenging career opportunities for qualified computer specialists in areas of hardware evaluation, planning, performance and systems software.

Hardware Systems Specialists

Qualified individuals will assume high level positions having direct interface with senior company management. Candidates should have a B.S. degree, at least five years in data processing experience, and knowledge of hardware/software systems. Individuals will perform evaluations, direct planning efforts, and manage the performance of current and future computing equipment for the company. Experience with IBM equipment, minicomputers, peripheral hardware, distributed systems, and data communications is desirable. For further information, call Dick South collect at (213) B47-6121.

Software Systems Specialists

You will be a member of a team maintaining the MVS operating system for two IBM 370-168's which support more than two hundred on-line terminals under IMS/VS, TSO, RJE and interactive graphics. The organization is moving rapidly this year into distributed processing with terminals attached to minicomputers in turn attached to the host 370. IBM 3850 Mass Storage and 3350's are already installed. Candidate should have at least five years experience in sysgens, installing PTF's, problem diagnosis, and assembly language coding. Most recent experience should be with MVS and prior experience with MVT. Degree in Computer Science is preferred. For further information, call Duane Bickel collect at (213) 847-6121.

These positions command excellent salaries and fringe benefits including savings, medical and dental plans.

Please write or send resumes to Bill McVeda, Lockheed Employment Office, P.O. Box 551, Burbank, CA 91520.

Lockheed-California Company
Burbank, California
An Equal Opportunity Employer M/F

Computer Professionals

Are you better than your present job?

Are you one of those people who fell into a pretty good job? With pretty good pay? With a pretty good company? And you're rocking along okay... but you *could* be doing a lot better. Consider a change to TI. We offer lots of challenge and outstanding opportunities to people who can prove their value. Positions require a bachelor's degree and U.S. citizenship.

IBM/370 Programmers

Requires experience on IBM/370 using COBOL/ALC working with IMS/DL 1 data base systems.

Systems Analyst/Project Leaders

Requires detail design and implementation of hierarchical data base systems to support engineering, production planning and control, materials management, shop floor control, and factory automation.

Computer System Engineer

M.S. or PhD in Electrical Engineering or Computer Science and 5 years' experience in hardware and software design of real-time computer systems.

Communication Network Engineer

Engineering or Scientific degree with 3-5 years' experience in the communication field with emphasis on data communications.

Software System Designer

M.S. in Computer Science or Engineering and 5 years' experience in design of software systems for real-time and interactive systems.

Programmers

B.S. in Computer Science, Math, Physics, Engineering or Business and programming experience with higher order languages such as Fortran, COBOL, PASCAL, or PL/1. Both scientific, business and real-time programmers are needed. Openings for these positions are in Dallas, Texas.

Minicomputer Programmers

Requires experience on 16 bit mini's using Fortran or Assembly languages working on data base management, communications, factory automation, interactive graphics and computer aided design.

Send your resume in confidence to: **Staffing Manager/ Equipment Group/P. O. Box 6015, M.S. 222/Dallas, Texas 75222.**

Software Systems Analysts:

If you're looking to get in on the biggest news in minicomputers today...

The hunt is over!

The unprecedented acceptance of our new family of minicomputers, the LEVEL 6, has created exceptional growth opportunities for Software Systems Analysts who are seeking positions that will enable them to utilize their abilities to the fullest. That's why, if you've been looking for a position that will really advance your career . . . the hunt is over!

We now have Software Systems Analyst openings in the Los Angeles, Chicago, New York and Atlanta areas. If you have more than 2 years experience in software development in the areas of communications software, compilers, operating systems, or support of these products in customer environments, then we want you for these challenging positions.

If you want to find out more about your possibilities with Honeywell and LEVEL 6

PLEASE CALL COLLECT RON SULLIVAN OR JACK WHITE AT (617) 964-3100, Ext. 6282

or forward your resume, including salary history, to Jack White, Honeywell, Dept. K822, 200 Smith Street, Waltham, MA 02154.

CAREER OPPORTUNITIES IN MARKETING

New York Chicago San Francisco

COMTEN's Technical Marketing Support department is firmly committed to provide pre-sales support services to the COMTEN sales force. The support functions provided are as follows:

- Product related Technical presentations
- Product related Technical Bulletins
- Product related Competitive Market Analysis
- Generation of proposals and price quotations
- Research of and Response to technical questions
- Various other duties as assigned by management.

The ideal candidate will be an assertive, creative Data Communications Professional with the appropriate academic and Data Communications systems background to fulfill the minimum position requirements. The personel qualities that will enable you to contribute to the groups growth — decisiveness, ambition, and excellent interpersonal skills - are very important. In addition, you should have a Bachelors Degree, or equivalent experience in a related field.

For the qualified data communications professional who is seeking a challenging position as a Marketing Support Analyst with a dynamic leader in the field of Data Communications, COMTEN offers an attractive salary and benefit package.

To further investigate these positions, please forward your resume, including salary history to Jerry Olson, COMTEN, Inc., 1950 W. County Road B2, Roseville, Minnesota 55113.

SYSTEMS PROGRAMMER OS/MVS/CPE

Looking for maximum career opportunity? Come maximize our computer utilization.

If you're an experienced specialist with a background in Computer Performance Evaluation (CPE), come grow with the Computer Planning Section of R.J. Reynolds Industries in Winston-Salem, N.C.

Our large-scale computer facility is undergoing conversion from DOS/VS to OS/MVS. You can play a key role in this changeover and make the most of your knowledge of OS and hardware and software monitoring of IBM 370s.

You'll be using hardware and software monitors, evaluating results, providing management with summary reports of utilization, and writing recommendations for improvements. You should have monitoring experience with IBM 370s and MVT, SVS, or better, MVS skills. Degree desirable.

We offer opportunity for rapid and sustained career growth, commensurate salary, and paid relocation to one of the most attractive living areas of the East Coast. Send resume and salary history to Mr. Oenis G. Simon, Manager of Employment, R.J. Reynolds Industries, Inc., 401 North Main St., Winston-Salem, N.C. 27102.

SYSTEMS PROGRAMMERS

IBM 370 SYSTEMS PROGRAMMERS
DEC-10 SYSTEMS PROGRAMMERS

Technical Services at Indiana University/Purdue at Indianapolis has challenging career opportunities at all levesl for systems programmers with experience on DEC-10's and/or 370's.

Positions exist in two areas:

Operating and Telecommunications Systems — B.S. and at least one year experience with TOPS-10. Knowledge of operating system internals a must. Familiarity with performance measurement and schedulers highly desirable.

Systems Software — B.S. and at least one year experience with editors, loaders, compilers, and other systems programs. This position will also support similar requirements on a CDC 6600 and Cyber 172.

A challenging position as lead systems programmer is open to the right individual with at least two years' experience with 360 or 370 operating systems, at least one year of which must be in DOS/VS or OS/VS. This individual will have full responsibility for operating system software on a 360/44 running DOS and on a 370/125. The 370/125 will be used for academic instruction in operating system theory and construction and will run DOS/VS, OS/VS1, and VM. It will also act as an RJE station to the DEC 1090 and a 370/158 running MVS. This position thus offers considerable opportunity for growth and technical challenge.

IUPUI has a student enrollment of 22,000 and combines the strengths of the curricula of two BIG TEN SCHOOLS and the largest school of medicine in the country. Computer equipment on campus supported by Technical Services includes IBM 360/44 and 370/125 systems and a DEC 1090. In addition, the group provides support and has access to a 370/158, CDC 6600, and CYBER 172 at our Bloomington campus, as well as a large number of minis in use for research at Indianapolis.

Fringe benefits are excellent. Salary is commensurate with experience.

Please submit resume to: Bill Scnlik, Personnel Division, Indiana University/Purdue University at Indianapolis, 1100 W. Michigan St., Indianapolis, IN 46202, An Equal Opportunity Employer.

Talk With Us About The Career Challenges In Telecommunications

CALL TOLL FREE

(800) 323-1966

In Illinois (800) 942-0491

Today thru Friday from 8 am to 5 pm cst

Telecommunications is one of the most rapidly growing segments of the software frontier. We have major projects underway now . . . forerunners of our long-term commitment to significantly advancing the state-of-the-art. We're working from definition and design through development and implementation in areas such as CAD, Data Base Systems, Simulation, Fault Recovery, Diagnostics and many areas of software design in an on-line, real-time environment.

SOFTWARE DESIGN

We're looking for an indepth background in the development of systems software and a minimum of 3 years' experience in structured design, testing and documentation of programs running on large data base, multi-file systems in real-time. Familiarity with HIPO design documentation, TSO usage and software simulation techniques as well as PL1, Fortran and assembler languages for the 8080 and PDP 11 programming is also important.

DATA BASE DESIGN

This position requires a minimum of 5 years' experience in the planning development, design and implementation of data base software, including data base management systems administration. Your primary responsibilities will be the development of data base system for a large on-going project including the implementation, support and administration of systems.

COMPUTER AIDED DESIGN

We are looking for an extensive background in the design of CAD/CAM systems and the development of Interactive access by the users of CAD/CAM functions. Required is 5-10 years' experience in both hardware and software aspects; DA systems operations, and design, and systems engineering. Your initial responsibilities will include evaluation of existing systems, and working with a project team in the Architectural Planning of a major new system.

MINI-COMPUTER PROGRAMMERS

We have specific assignments available on project development teams responsible for the design implementation of various telecommunication processing systems utilizing mini-computers as the processing element. Responsibilities will include the development of software programs for real-time operating systems as well as unique hardware elements incorporated into the systems.

If you have in-depth expertise in one or more of these areas, a BS, MS or PhD in Electrical Engineering, Computer Science, Math or other appropriate engineering discipline and have an interest in moving forward with one of the challenging new frontiers in computer technology, talk with us.

If unable to call, please send your resume to:

PROGRAMMER/ANALYST

DataPhase Systems Inc., a rapidly-growing leader in interactive database applications, has several challenging positions on its software staff. Responsibilities include system development and implementation, field support, and interfacing with vendors and customers. Limited travel. Two year's active experience in programming, including experience with MUMPS or MIIS, would be preferable, as well as familiarity with minicomputer systems. Good communication skills required.

We offer an excellent salary and benefits program, with exciting opportunities for personal and professional growth.

Please call or write in confidence to:

Mr. Lloyd F. Botway
Manager, Systems and Development, DataPhase Systems, Inc., 4528 Belleview, Kansas City, MO 64111 (816) 931-7927. EOE/MF

The Mini with a Mighty Future!

The minicomputer marketplace has tremendous potential and is increasing in size by leaps and bounds. At Sperry Univac, we are committed to becoming a major force in this market. Our V-77 family of high performance minicomputers is a fast, powerful trio that relate to most mainframes. This mini family presents an affordable high performance solution to existing computer problems. Each mini can work individually as a stand-alone computer or together as a true network hierarchy. They are specifically designed to grow and adapt to a variety of applications from scientific to data communications.

Challenges come in all sizes for Sales Engineers & Analysts

Commissions

Wa hava ona of tha industry's best incentive plans for Sales Engineers.

Sales Engineers

If you have...

a minimum of 2 years mini-computer sales experience in the Data Base, Data Communications and/or Distributed Processing marketplaca AND technical competence in hardware and softwara plus a racord as a closer who maintains account ralationships and gets new and rapeat business, check our Salas Opportunities – you can't miss.

Growth

We are growing - not promising - and this means real career opportunitias for the short term and the long term.

Field Analysts

If you have ...

at least 2 years experience with Data Base, Data Communications and/or Distributed Processing applications and considar yourself creative with a proven record in defining innovative solutions we have pre-sales analyst positions which will provide you raal challenge and push your technical competence to its highest level.

CSC

PROGRAMMER/ANALYSTS

AT CSC's SYSTEM SCIENCES DIVISION, YOUR OPTIONS ARE GREATER ....

Computer Sciences Corporation is a world leader in information sciences with more than 8,000 people working on governmental, commercial, and industrial projects.

CSC's System Sciences Division is creating more positions to meet project demands, offering you professional challenges and career choices commensurate with your ability.

Currently, we are expanding two projects: Our FAA assignment is to develop and implement air traffic control systems; and our NASA program supports three major projects. Professionals of all levels of experience are welcome to investigate opportunities now available in our organization.

AIR TRAFFIC CONTROL SYSTEMS

We are seeking experience on IBM 360/DS in any one of the following areas:

Simulation of air traffic patterns. Knowledge of JOVIAL a plus.

Design and implementation of data base management systems

OS/360 System generation and maintenance

Diagnostic design, development or enhancement and hardware orientation

Software test and validation including development of tools to test and validate real-time software systems.

Software Quality Assurance

BAL and/or high level language (preferably JOVIAL) experience highly desirable.

Positions are located in Jacksonville, Florida.

SPACE SCIENCES

Current positions in support of our Goddard Real-Time System, Space Tracking Data Network and Dn/Dff Site Project for the NASA Goddard Space Flight Center require a degree in Computer Science, Math, Physics, Astronomy, Meteorology or Engineering with experience using FORTRAN and/or Assembly languages on large-scale or mini-computers. These skills will be applied in the following concentrations:

- Telemetry application with multi-computer configuration
- Integration and testing of real-time display software
- Data base management
- Real-time scientific applications
- Network management
- Computer-to-computer communications
- System requirements definition
- Analysis and application of climatological data
- Simulation/modeling of real-time systems

CSC offers a liberal relocation policy in addition to a complete benefits package. For immediate consideration please send resume or call:

EASTERN MONTANA COLLEGE BILLINGS, MONTANA

The Computer Center of a comprehensive state college, responsible for computational services for academic and administrative needs, has three positions available in administrative data processing. We are expanding our facilities to a DECsystem-10 and if you qualify and would like to grow with us in an on-line environment, you may be interested in one of the following positions:

SYSTEM ANALYST II

Able to design, develop, program and maintain information and reporting systems. Three to four years of programming using COBOL with systems design experience and knowledge of the DECsystem-10 or other major time-sharing system required. Accounting background and/or experience in college environment with on-line systems preferred. Salary: $14,748.

PROGRAMMER II

Position requires one to two years of solid COBOL programming experience and ability to assist in determining and analyzing the system needs of users. DECsystem-10 or other major time-sharing system background preferred. Salary: $13,489.

OPERATIONS SUPERVISORY II

Requires supervisory and computer operations work and ability to coordinate the activities of the data entry and I/O units. Must have DECsystem-10 or similar equipment experience. Salary: $12,335.

We offer an excellent salary and benefits package and a congenial working environment — complemented by the ideal location and benefits of Billings. To apply, send letter of application, resume with references and salary history in confidence before September 6, 1977, to:

Jack C. Hall, Director, Computer Center
Eastern Montana College, Billings, MT 59101 (406) 657-2235

EDP WITH NCB

We are Ohio's largest national bank. Our Data Processing division has more than doubled in size to over 150 people in five years. We are OS with four large IBM 370 systems.

Systems, Banking and Customer demands in the areas of Electronic Funds Transfer, Branch On Line systems, Integrated Financial Services and EDP Auditing have created openings in both Banking and Financial application for:

SYSTEMS ANALYSTS

(Project coordination and design of large on-line systems)

PROGRAMMER ANALYSTS

(OS, BAL or COBOL programming and design)

SYSTEMS PROGRAMMERS

(Operating Systems Programming—OS/VS2-MVS)

EDP AUDITORS

(Analysis and design of security controls for new and extant systems)

All candidates must have a minimum of 2 years EDP experience in a large computer environment and any of the following qualifications' BAL, COBOL, OS/VS1-VS2, TP or CICS. Individuality and creativity is recognized and rewarded.

We offer excellent working conditions in a large, modern data center in the suburbs, but close to the Interstate public transportation and shopping — market adjusted, realistic salaries and excellent benefits including profit sharing.

Join a stable, growing, profitable industry.

Career Opportunities at.... BUNKER RAMO in Connecticut

With our on-going program of development and creation of new products and services coupled with the tremendous acceptance from business, industrial and financial firms, our prominent corporation, a leader in the field of sophisticated telecommunications and on-line computer terminal systems, has excellent openings available for talented, qualified professionals with expertise in the following areas:

MINI COMPUTER PROGRAMMERS

The career-oriented individuals we seek should have a degree in a related field, with at least 1 year Assembly Language Programming. Software experience related to Mini Computers, Micro Processors or Intelligent Terminals essential. Familiarity with on-line telecommunications helpful.

MARKET DEVELOPMENT SPECIALISTS

For these positions we require individuals with a Bachelors degree or equivalent in a related technical field. All applicants should have several years in-depth experience in computer programming, systems analysis, technical marketing or sales support. In-depth knowledge of General Purpose or Intelligent Terminals essential. Duties will include assisting sales department in proposal generation, presentations, trade shows and sales training. Good written and oral communication skills are essential. Related background in the insurance industry would be a plus.

In addition to excellent starting salaries and comprehensive company benefits, we also offer exceptional working conditions at our modern facility in Trumbull, Connecticut, one of the most up-to-date in the industry with easy accessibility to New York and Boston.

Qualified applicants should send detailed resume with salary history and requirements, indicating position desired, in strict confidence to:

Mr. Peter Soligon, Bunker Ramo, Information Systems Division, Trumbull Industrial Park, Trumbull, Conn. 06609. An equal opportunity employer/male and female.

BUNKER RAMO

The Software Documentation people we're looking for probably aren't looking for a job.

We're the Digital Software Documentation Group, a proud collection of Writers and Editors. We like being part of this organization, not just because Digital is an important computer company, but because we're important to Digital.

We are on an equal footing with the Software Development organization, not a step below it. This is reflected in our salaries, our autonomy, our enthusiasm, and our corporate clout. We're not used to getting a lot of empty promises. What we do get is the necessary funding for our projects and enough freedom to produce the kind of documentation end-users can really sink their teeth into.

We have some of the best software documentation people in the business. And now we want the rest of the best because this group is determined to produce nothing but the highest quality work. We're looking for great Writers, Editors, and Programmers with a flair for writing; people doing fine where they are but who would thrive in an organization that provides a great challenge to grow.

What Do We Offer You?

An opportunity to work for a comany that recognizes the importance of software documentation; to be an integral part of the development team.

An opportunity to work with a highly autonomous, highly charged group, where quality, not volume, is the objective.

An opportunity to experience real freedom, to take what has to be done and put your personal stamp on it.

An opportunity to have real impact on the support group, Digital, and the industry as a whole.

An opportunity to be catapulted forward in your career and choose your own directions to move in. You can follow either the administriave or technical path of our dual career program. Either way there will be personal satisfaction and, of course, compensation.

If this is the kind of involvement you're looking for — or if you'd just like to learn more about us — let's talk.

Forward your resume to Theresa Buckley, Digital Equipment Corporation, Dept. 8, 162 Main Street, Maynard, Massachusetts 01754.

We're the company looking for people.

POSITIONS IN COMPUTING AT CORNELL UNIVERSITY'S COMPUTER CENTER

Cornell University is located in Ithaca, New York, a small city in the Finger Lakes area of central New York. While enjoying freedom from pollution, traffic jams, and other urban problems, Ithaca is still a stimulating and intellectually active environment, and the lakes, parks, and nearby rural setting provide many recreational opportunities.

Administrator, Data Communications and Small Computer Systems Support.

Management of these rapidly developing areas require an individual with a broad background of technical expertise in both small and large system software and in data communications. Familiarity with digital logic and interfacing techniques would be useful as well. Given an adequate technical background, administrative and supervisory capabilities will be strongly considered.

Systems Maintenance Chief — 370/168

The Systems Maintenance Chief is responsible for the day-to-day software operation of Cornell's 370/168, running VM/370 and OS/MVT-HASP; for the evaluation, scheduling, and installation of software changes to the system; for hiring, training, and supervising maintenance staff, and for a variety of related activities. Minimum qualifications include a background in the relevant software areas and capability in management and administration.

Project Leader, Accounting and Management Information.

This position will be responsible for the development, operation and maintenance of automated systems which provide on-line and off-line computer use accounting, and for resource utilization and related management information functions. Although this position will initially be involved with the 370/168's VM and OS/MVT systems, future areas of activity will include accounting and management information for communications networks and distributed computing facilities. Previous experience in the design and implementation of business systems is essential, and management experience and growth potential are highly preferred.

Cornell offers an attractive benefits package and intends to offer competitive salaries for these positions. Please send resumes to:

Office of Computer Services, Langmuir Laboratory, Cornell University, Ithaca, N.Y. 14850. Cornell University is an Equal Opportunity Employer.

PRODUCT MARKETING PROFESSIONALS

For Advanced Dispersed Processing Systems

Make Your Future with the Leader

Datapoint Corporation has openings at its home office in San Antonio for product marketing analyst professionals to work with our advanced dispersed processing systems. Duties will span a wide range of responsibilities including competitive product analysis and providing marketing inputs on the design of new Datapoint products and the improvement of existing products.

Applicants should have three to five years of commercial programming experience with a background in operating systems, minicomputer time sharing and/or communications. Prior associations with a computer manufacturer as well as in end user operations would be a plus. Candidates should have good analytical skills on hardware/software developments, and the ability to articulate findings orally and in writing.

These positions offer the opportunity to fill a key role with Datapoint Corporation, one of the fastest growing companies in the computer industry. Successful candidates will receive excellent salaries and benefits, opportunity for rapid advancement and the challenge of a fast moving work environment. And San Antonio offers outstanding scope for quality living in a Sun Belt setting.

For more information, send resume with salary history to **Mr. Chuck Zeleny, Manager of Employee Relations, Dept. CW, Datapoint Corporation, 9725 Datapoint Drive, San Antonio, Texas 78284.**

CONTROL DATA CORPORATION

An Affirmative Action Employer M/F

We can give you 3 good reasons to call Robert Half for data processing positions:

1. Robert Half has been in business for about 30 years. Can you name an EDP personnel service that's been around longer?

2. Robert Half specializes. We've been an integral part of the data processing community through all its generations.

3. Robert Half's offices are staffed by experts in the EDP field.

and if 3 reasons aren't enough, we can give you 55 more:

55 offices. Robert Half is a network throughout the U.S., Canada and Great Britain. One call and you've searched the local market ... or the world.

and if 58 reasons aren't enough, we can give you Half a reason more:

Robert Half. Where integrity is a lot more than just HALF.

Personnel Management and Reporting

MSA'S Personnel Management and Reporting System keeps records on more people than live in Atlanta, San Diego, Boston and Los Angeles combined.

If you'd like to find out how this system can help you keep comprehensive personnel data in compliance with Federal Governmental EEO, ERISA and OSHA requirements, call Marge Kimbrough at (404) 262-2376 or send us this coupon.

ACCOUNTING SOFTWARE FOR DEC RSTS/E CTS-500 USERS

From one of the pioneers in commercial data processing using RSTS. Successful installations in manufacturing, distribution, service bureau uses. Completely on-line, interactive systems. If you are installing or have installed a RSTS/E or CTS-500 system, contact us first for cost-effective solutions in: ACCOUNTS PAYABLE; GENERAL LEDGER; FINANCIAL REPORTING

The design specifications for these packages were developed by accountants for use by accountants. All packages provide excellent audit-trail, extensive user prompting, fast data entry, full file-maintenance and inquiry capabilities, modular design and construction.

These are consolidating packages and support multi-division company and multi-company corporate accounting functions.

For more information, contact us at:

Our new "walkaway" leasing program is better than anything IBM has to offer.

Our new INVESTMENT TRUST LEASING PROGRAM offers short term "walkaway" operating leases on new IBM System 370 computer systems and all other current IBM equipment. And at prices that offer tremendous savings over IBM lease and rental rates.

DPF, a Fortune 500 company, is the largest independent computer leasing company in the country with a computer portfolio valued at over $450 million.

If you have an IBM system presently on order or need early delivery, we would like to save you a lot of money. Just call Mike Swords, collect, at DPF Inc., Executive Offices, 141 Central Park Avenue South, Hartsdale, NY 10530, (914) 428-5000. Or call any of our regional offices listed below.

Survey Finds Minis Claim New Territory

By Esther Surden
CW Staff

NEWTON, Mass. — While minicomputers are not yet ready to take over the mainframes' world, more and more are infiltrating the large systems' territory.

Many large users have turned to minis as a solution to at least part of their DP workload, a recent CW survey found.

More than 220 users, representing about 800 minicomputers from 35 different vendors, responded [CW, July 4].

About one third of those who participated in the survey had multiple minicomputers in their shops or in remote company locations. About one fourth either used their minis in conjunction with a mainframe or along with time-sharing on a large system.

While the use of minis continues to spread to both large and small companies, software support remains the bane of the mini user's existence with over a quarter of those responding to the survey calling their vendor's support poor. Even many of those giving their vendors good ratings pointed out deficiencies in support. (See related story on Page 7).

CW Special Report on Minicomputers and Small Business Systems follows Page 34.

Users did not single out any particular vendor for their criticism, and critical arrows hit large and small vendors alike. Users who were disturbed about software support were very vocal in making this known. As one sophisticated user with approximately 85 minicomputers under his control noted, "mini vendors sell hardware; there is not

Groups Explore Change Needed In Federal DP

By Edith Holmes
CW Staff

WASHINGTON, D.C. — A new federal agency is needed to consolidate government computer and communications procurement and management under one roof, according to several recommendations received by the President's reorganization team in the Office of Management and Budget (OMB).

This view, expressed by several computer industry associations and active individuals, contrasts with the view held by vendors such as IBM and Computer Sciences Corp. (CSC) and Rep. Jack Brooks (D-Texas) who have urged that federal oversight of agencies' computer and communications operations remain essentially what it has been for the last 12 years.

Oversight Divided

The existing structure, established in 1965 by the Brooks Act (P.L. 89-306), split DP oversight tasks among OMB, which is responsible for central and fiscal management review, the General Services Administration (GSA), which handles the acquisition of DP and communications equipment for most federal agencies; and the Department of Commerce, which houses in the National Bureau of Standards (NBS) the Institute for Computer Sciences and Technology — the standards-setting body in this field.

OMB has received "several hundred responses" as a result of its solicitation for comments from anyone interested in the management of federal DP resources [CW, July 11], a spokesman for the reorganization project said.

For the time being, comments from the federal agencies themselves are being treated as "advice to the President" and so are unavailable to the press and public, he added.

10 Attacks Within a Year

DP Center Bombings Plague Italy

By E. Drake Lundell Jr.
CW Staff

MILAN, Italy — An armed terrorist group here has singled out corporate and state computer centers as targets for attack, bombing at least 10 such centers throughout Italy during the past 10 months.

The group, which has attacked only computer centers to date, calls itself the Unita Combattenti Communiste, which translates to the "Communist Combat Unit." In the past 10 months it has attacked three manufacturing companies, three chemical firms, two universities, an oil company and a local government office.

And while estimates are not available for all of the bombings at this time, the damage amounted to well over $5 million for the five cases where such figures were available — or a little over $1 million in damages per bombing.

This wave of political computer center bombings is apparently "unprecedented," according to Donn B. Parker, a computer crime expert from SRI International. Parker noted that in the past 10 months there have been more such cases in Italy than have occurred in the U.S. in the almost 20 years he has been keeping statistics on the subject.

A general theme in the communiques left by the groups after each bombing is that computers are "instruments of the capitalistic system" and therefore must be destroyed.

The attacks appear to be well coordinated and to be the work of a group that has "cells" or "cadres" in different parts of the country, according to European security forces.

The attacks are all run in a military style, they noted, and the comuniques issued after the bombings use military phrasing.

In each case, the attacks have taken a minimum amount of time with the terrorists apparently knowing exactly where to go within the computer center to do the maximum amount of damage, they added.

The group's first attack took place on May 26, 1976 in the public terminal room of the tax collection agency for the local government here.

In this case a large group — 15 men — entered the room carrying handguns and submachine guns. They threw 10 Molotov cocktails, eight of which ex-

Court Orders New Trial For Greyhound vs. IBM

By Molly Upton
CW Staff

SAN FRANCISCO — Greyhound Computer Corp. will have a second chance to prove that IBM monopolized the computer leasing industry.

An appeals court here, after remaining silent for more than three years, overturned an earlier decision in the case that favored IBM and it ordered the matter retried.

The Greyhound case, filed in late 1969, was the first antitrust suit against IBM to go to trial, but the charges against IBM were dismissed by Judge Walter E. Craig in July 1972 before IBM presented its defense.

Craig ruled that the computer leasing company did not present enough evidence to support its charges that IBM monopolized the leasing market by restricting sales of its computer equipment.

Craig therefore entered a "directed verdict" in favor of IBM, even before that firm presented its defense before the six-person jury.

Greyhound appealed that decision in April 1974 and has been waiting since then for the decision of the Ninth Circuit Court of Appeals, which has now overturned Craig's ruling.

The appeals court, in a decision writ-

N.Y. Halts Software Tax

By Molly Upton
CW Staff

ALBANY, N.Y. — New York State Tax Commissioner Thomas A. Lynch last week declared a moratorium on audits and assessments on DP software and services pending further consideration of the matter.

Following a hearing on taxation of the DP industry attended by a standing-room-only crowd of over 50 persons, Lynch and counselors Peter Crotty and Arnold Glass indicated they would refer the issue to the full three-man tax commission for possible formulation of new regulations.

At the end of the hearing, Lynch stated that the commission will consider the matter at its next meeting in October.

Lynch instructed those present to remit to the state any sales taxes they had already collected from customers. However, he did not indicate what course of action DP firms should take in the interim, observed Sandy Goldberg of Roberts & Holland, attorney for the Association of Data Processing Service Organizations (Adapso). Goldberg surmised one should continue collecting the taxes.

IBM Antitrust Suits Boiling Again

By Molly Upton
CW Staff

SAN FRANCISCO — The recent Ninth Circuit Court ruling throwing the Greyhound Computer Corp. vs. IBM antitrust case back into the courts adds one more ingredient to what may prove to be a boiling pot for IBM.

IBM has Cravath, Swaine & Moore attorneys actively engaged in the U.S. trial and hanging on the line in the event that the case of California Computer Products, Inc. vs. IBM comes back to life as Greyhound did.

As in the Greyhound case, IBM received a directed verdict in the Calcomp suit against it.

Meanwhile, IBM is already busy defending itself on the West Coast in the recently opened trial of a suit filed by Forro Precision, Inc.

This, even before the scheduled January opening of the Memorex vs. IBM antitrust case.

The law firm retained by IBM for the Memorex action, O'Melveny & Myers of Los Angeles, is also handling its defense against Forro.

Forro, a disk drive components manufacturer, file the suit in 1974 after IBM had the instrument maker's plant searched as part of its research into alleged thefts of disk drive trade secrets by former employees of IBM's San Jose facility.

$36 Million Sought

Forro seeks $36 million in treble damages on antitrust grounds and also charges IBM with seizing its records and trying to put it out of business.

IBM's $25-million counterclaim alleging unlawful market presence and misappropriation of trade secrets is also part of the jury trial which is expected to last until October.

Speaking for IBM, attorney Henry C. Thumann said, "Far from showing any damage to Forro from the activities of IBM the evidence in this case is going to show unjust, unlawful profits enjoyed by Forro Precision through its exploitation of IBM technology and IBM specifications, which it knew [were] obtained unlawfully in violation of the rights of IBM."

Forro attorney Joseph A. Alioto said evidence will show "the effort made by IBM to infiltrate Forro and find out as much information as they could about Forro and, by reason of that information, about IBM's peripheral competitors, information they knew they could not otherwise get in the marketplace itself."

Alioto charged that in 1970 IBM hired a man to "get into Forro and find out what Forro had, find out what its production was, find out who its customers were, prices and things like that."

Greyhound vs. IBM, Act 2

(Continued from Page 1)

ten by Justices Browning, Wallace and Moore (who normally sits on the Second District Appeals Court in New York), said the trial should have been allowed to run its course because the jury could have found that leasing general-purpose computers for commercial applications could have constituted a relevant market for antitrust purposes.

The decision also found evidence in the record "from which the jury could reasonbly infer that IBM possessed monopoly power in the leasing of general-purpose commercial computers."

The court, the ruling continued, is "bound to view the evidence in the light most favorable to [Greyhound] and to give it the benefit of all inferences which the evidence fairly supports, even though contrary inferences might reasonably be drawn.

"The jury [also] could have concluded that IBM maintained its monopoly power in the leasing of general-purpose computers in part by practices that unnecessarily, even deliberately, excluded leasing companies from an opportunity to compete," the ruling said.

Further, "Greyhound offered direct evidence to prove that the conduct complained of did occur and that it restricted the competition of leasing companies in the leasing market, in which IBM possessed monopoly power," the appeals court stated.

"This was sufficient to establish the prima facie case. Greyhound wasn't required to prove the source of IBM's power to do what Greyhound's evidence indicated IBM in fact did," the court ruled.

An IBM spokesman contacted last week stated: "We are confident that given the opportunity to present our case we will prevail on the merits."

IBM Strategy

Greyhound contended IBM sought to make the purchase of computer equipment by lessors economically unattractive through the use of the fixed-term plan, discontinuance of technological discounts, increase of the lease/purchase ratio and unbundling.

The appeals court found Greyhound failed to prove the fixed term plan was not a reasonable response to competition. But it indicated the jury could have found the other actions either intentionally or effectively anticompetitive.

Original Decision

In the original decision, Judge Craig had ruled the evidence was "insufficient" to establish a relevant market and IBM's share of the market.

In addition "the evidence was insufficient to establish IBM's control of a market."

Furthermore, "the share of any market IBM holds has been achieved as a result of superior skill, foresight and industry," Craig had ruled.

According to the original ruling, "IBM's activity of which Greyhound complains was a competitive response to economic factors over which IBM had no control; and "Greyhound's damages were 'purely speculative.' "

The appeals court also took time to refute certain of IBM's arguments.

The appeals court let stand Judge Craig's finding that IBM had not breached an obligation to provide services to Greyhound's lessees who were first users of the machines and it ordered the rest of the case back to trial.

QUESTION

If 13 of the 15 most profitable U.S. companies use SyncSort, can you afford to be without it?

Call (201) 568-9700

for a free six-step sorting survey.

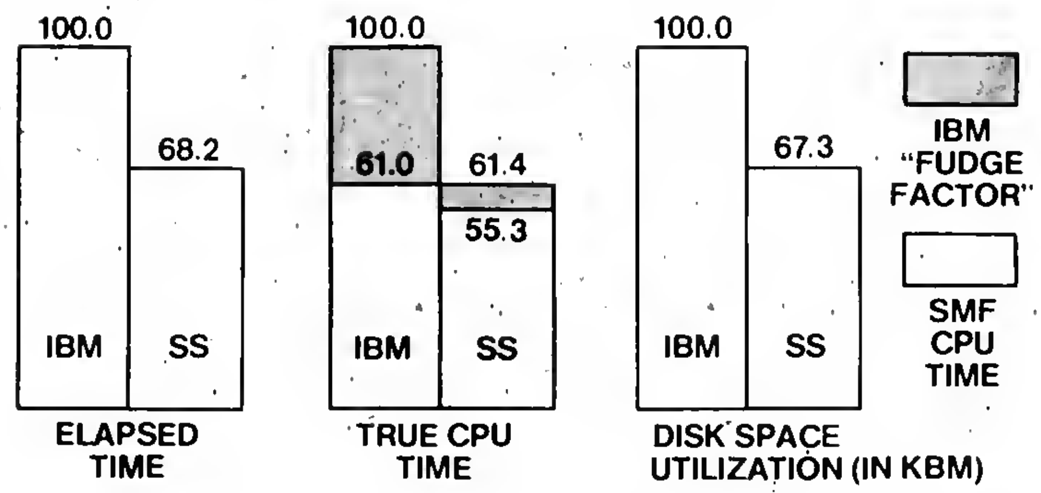
One thing that makes us particularly proud of SyncSort is the company it keeps—and the companies that keep it.

A glance at the list below will show you the source of our parental pride. These are the 15 most profitable companies in America, as selected by the Forbes Magazine Profits 500 list:

RANK	COMPANY '76
1	American Tel. & Tel.
2	General Motors
3	Exxon
4	IBM
5	Ford Motor
6	Mobil
7	General Electric
8	Standard Oil (Ind.)
9	Standard Oil (Calif.)
10	Texaco
11	Gulf Oil
12	Shell Oil
13	Sears, Roebuck
14	Eastman Kodak
15	Dow Chemical

Thirteen of these winners—we're sorry we can't identify them—sort with SyncSort. And we don't think that's just pure coincidence. All of the 13 have benchmarked SyncSort against competitive sorts, on their own files, and they've simply come to the conclusion that our sort sorts best.

If you'd like to do the same, we'll be glad to oblige you. Just give us a call and we'll arrange a free sorting survey, the highlight of which is the benchmark. If you want to compare SyncSort against, say IBM's SM1-5740, Release 3, on your files, under exactly equal conditions, you can expect savings in computer resources that look like this:



A fourteenth name on the list is going through the SyncSort testing phase right now, and any day we hope to be able to announce that we have 14 out of 15.

Will we ever get all of them? Alas, probably not. A glance at name No. 4 will tell you why.

IBM, you may soon be the only company on the "most-profitable-15" list that *doesn't* sort with SyncSort!

Federal DP Needs Consolidation, Observers Say

(Continued from Page 1)

The request for public comments on the issues OMB has identified in the federal DP and communications areas is one of the first steps in the reorganization of federal data processing. OMB hopes to give its final recommendations to President Carter within 10 to 12 months, the spokesman stated.

Afips Panel

Representing its member associations, the American Federation of Information Processing Societies (Afips) set up a panel to develop recommendations. That panel determined that while OMB "should continue to provide government-wide enforcement" through fiscal control, an independent agency should be established whose "sole mission" would be responsibility for all federal DP and communications procurement and management.

Afips envisions such an agency as having authority over all other agencies in management policy, procurement, technical support and standards development and implementation.

The agency, which would thus consolidate the functions now performed by OMB, GSA and NBS under the Brooks act, would also perform long-range planning of DP and communications operations as part of the regular budget cycle, according to the Afips scheme. Agencies would undergo "mandatory periodical total system performance evaluation and analysis" by this organization as well.

The independent body would maintain an inventory of well-documented software packages with information on their performance and provide technical consultants to other agencies, Afips stated.

Finally, the agency would make recommendations to the Civil Service commission regarding adequate job categorization. A particular emphasis would be placed on software personnel and the provision of adequate continuing education to enable federal personnel to keep abreast of technological change, Afips said.

The Computer & Communications Industry Association (CCIA) would consolidate the present Brooks Act functions under one organization, too, but that organization would have a different focus. The CCIA would place GSA and NBS within OMB, strengthen OMB by providing it with "a realistic five- to 10-year long-range planning capability," and elevate the management and budget agency to a cabinet-level position.

"All of the centralized procurement functions now scattered among GSA, OMB and NBS would logically fall within the scope of this single agency as ADP is, afterall, a management tool," the association wrote to OMB. It suggested that the "single agency" might be called the "Department of Planning and Management."

"Any reorganization in the federal ADP arena must begin with a renewed commitment toward standardization of ADP equipment," the CCIA added.

Grosch's Response

Speaking as "a Brooks Bill veteran" and as "a computer pioneer" rather than as president of the Association for Computing Machinery (ACM) or as a member of the Afips panel, Herbert R.J. Grosch recommended that any central authority the reorganization project decides to put together "must be predominantly technical.'"

These people need not be "chip designers or laser physicists," Grosch wrote, but if they are unable to easily cope with extreme technological innovation "used against them as a weapon by IBM and the other suppliers and by the fancier agencies," the organization "will be outflanked daily."

While the Commerce Department might be a good temporary home for such a body, Grosch would like to see it become independent eventually — along the lines of the central computer agency in Great Britain or the Swedish statskontoret.

"There is absolutely no hope for rapid or significant progress in DP standards in the U.S. until Cbema [the Computer and Business Equipment Manufacturer's Association] is taken out of the circuit," Grosch said, noting that Ansi's X3 committee is currently "operated" by the association.

While Grosch and Cbema clearly clash over this issue, they are in agreement in wanting to see the federal agencies' procurement of DP and communications equipment speeded up.

Need for Clarity

Cbema and several vendors expressed the need for clearer regulations in the area of equipment acquisition. IBM offered to share its planning and management techniques.

The computer industy leader also told OMB it "supports the separation of ADP policy and procurement responsibilities which currently exists between OMB and GSA."

IBM further stated its belief that the DP and communications equipment the federal government now has is behind the state-of-the-art and behind that of most other users.

Rep. Brooks interprets federal agency complaints that procurement takes too long as efforts to undermine the Brooks Act. In a memo to OMB, he expressed his belief in the system as established by the act, suggesting that the oversight agencies — OMB, GSA and Commerce — are at fault for not enforcing it.

"Without a firm commitment by OMB, GSA and Commerce to eliminate the historical barriers between these agencies and without the establishment of effective centralized ADP management in each agency, little hope exists that the government will be able to effectively manage and control its ADP resources," Brooks wrote.

To strengthen centralized DP management in the executive agencies as well as the oversight roles of OMB, GSA and Commerce, the congressman suggested greater support and funding be given to the federal government's software conversion program with a view toward limiting interim system upgrades.

The reorganization project is currently evaluating the comments submitted to it. In October, task forces will be organized and assigned to study such areas as procurement, standards and career development for DP and communications, the spokesman said.

Rash of Bombings Plagues DP Installations in Italy

(Continued from Page 1)

ploded, destroying eight of the 70 IBM 2740 terminals installed in the area. The center was down for a day and a half after the attack.

Then on Oct. 13, 1976, the second commando attack took place. This time, plastic explosives destroyed an unidentified computer system at De Angeli, a pharmaceutical company here.

A more documented action took place on Dec. 19, 1976 at Data-Montedison, an in-house service bureau for the huge Montedison conglomerate.

In this case, three men and one woman, carrying a large package approached the plant's security guards and told them they wanted to leave a present for a coworker.

The guards opened the gate to the plant, at which time the terrorists overpowered them and forced them to open the computer center. The terrorists went immediately to the communications controller in the center, doused it with gasoline and ignited it.

Immediately after this attack in Milan, three armed men in Rome — 500 to 600 miles away — forced their way into a private radio station and forced the radio personnel to read a statement defending the bombing. This led security personnel here to the conclusion that they were dealing with a nationwide organization.

Steel Plant

The next assault took place on Jan. 17, 1977, when the group planted a bomb above an IBM 370/135 computer at Sias, a steel manufacturing company here. The bomb broke through a bulletproof glass panel and did about $30,000 in damage to the center.

Immediately after this bombing the Sias DP manager was given permission to buy fireproof safes for his tapes — a long-standing request that had been previously denied by management.

The next case came on April 15, when a production control system was destroyed at Liquichimica, a petrochemical company in Saline Ioniche, Calabria. The four attackers again carried hand and submachine guns and doused the computer with gasoline, resulting in damage of about $1 milllion.

University Next

Then in April 21, two masked men and a woman forced their way into an intelligent terminal center at the University of Bocconi here and used explosives to blow up the center. The communique from this bombing, left in San Marco Church here, said the university was a center for the training of high-level executives "that will join the capitalistic forces" in the future.

The bombings prove the small teams of guerillas can attack the capitalists, the communique added.

The next major guerrilla move came on June 10, when three women broke into the computer center at the University of Rome and destroyed a Univac 1110 worth more than $4 million.

The women were armed with submachine guns and hand guns. They held the guards hostage while they evacuated the computer center, then covered the CPU with gasoline and ignited it. The action seemed well timed to catch the evening news and was prominently featured on Italian TV that night.

Three Other Attacks

Security personnel in Europe said there were at least three other attacks claimed by the group, but they would not publicly identify the companies involved except to say that one was an oil company and the other two involved manufacturing companies.

In addition to those attacks on computer centers, IBM and Honeywell Information Systems offices in Italy have also been the subject of terrorist attacks, the security men indicated.

'It Could Happen Here'

MENLO PARK, Calif. — Terrorist attacks on computer centers like those now taking place in Italy "could happen here," a noted computer crime consultant here indicated last week.

Donn Parker, a researcher with SRI Inc. (formerly Stanford Research Institute), warned that the U.S. Department of Justice has indicated there may be a step-up of terrorist activity in this country and indicated such activity could be directed toward computer centers.

Parker, who has studied computer crime for almost two decades, said "we have no history of any related attacks of this size" anywhere in the world.

In the late 1960s, he said, computer centers were targets of several bombings related to the antiwar movement, but since 1971 there have been almost no such attacks.

The Italian computer center attacks show we are "entering the era of high-technology terrorism," according to Wallace S. Bruschweiler, director of international operations for Data Security Holding, Inc.

And, he admitted ruefully, there is little that can be done to stop attacks like the 10 that have recently taken place in Italy.

While a computer center can, and should, set up fairly rigid access controls it is difficult to stop terrorists armed with submachine guns from pushing their way in, he indicated.

Verbatim™

The whole message is quality.

You want to record your message verbatim—word for word—whether it's bits, bytes or "Dear Folks" translated into word processor language.

Our objective in manufacturing recording media for the electronics industry—digital tape cassettes, floppy disks, mag cards, computer cartridges—is to give you the finest, the best, the most dependable, the most cost-effective.

That means rugged, long-lived, abrasion-resistant recording media with superior magnetic qualities. If we made tires, they'd be steel-belted radials.

We delivered our first digital grade certified tape cassettes back in the beginning, 1969. We made the first commercial 3740-compatible floppy disks that didn't bear IBM's name. And the first Flippy® reversible flexible disks with *anyone's* name on them. The first mini data cassette is ours. And we've got the newest miniature flexible disk, the MD 525.

Now, **Verbatim** media. It's a new formulation of ferric oxides, an advanced macromolecular binder system to adhere it to the tough polyester film, and a process control system that demands over 200 separate quality checks before the material is cut, packaged, and certified to be 100% error-free.

The final quality check? "Make it pretty!" Our production people tell us that magnetic recording media is one of the rare instances in manufacturing where aesthetic appearance translates directly into final product quality. It has to look beautiful to work beautifully.

We have the formulas, the machines, the technology to make high quality recording media. But it takes the best people in the industry to deliver Verbatim disks, cards, cartridges and cassettes. You'll find them here. Write or call for our new monograph, "Data and Word Storage Media." Phone (408) 245-4400. TWX 910-339-9381. 323 Soquel Way, Sunnyvale, CA 94086.

Minis Moving Into Large Systems Domain

(Continued from Page 1)

much concern for software".

An overwhelming majority of those who replied used their small systems for multiple applications, and most of the respondees preferred to do their own programming rather than get a turnkey system or outside help.

Selection Criteria

Price/performance ranked as the No. 1 criterion users gave for choosing their particular mini system, while software capability and vendor reputation were close behind. Many readers gave a combination of these factors as the reason for choosing their systems, while others mentioned vendor proximity, the vendor's ability to provide remote maintenance and good field service organization or a low bid.

Over 90% of the users rated their hardware maintenance service either good or excellent, and a majority called their maintenance service excellent. Several readers said they did their own maintenance.

As to what users will do when they outgrow their present systems, many stated they either did not expect to outgrow their systems or that an upgrade (adding more disk, another terminal, more memory) would take care of their growing pains for the foreseeable future.

Over half of those responding indicated that their next course of action would be to get a larger mini when their present system becomes overloaded. The second most popular answer was to "offload the system with another small system."

Purchase Decision

The area of the most diversity among those who returned the survey was the matter of who makes the final purchasing decision with respect to minicomputers. Although a central DP department was cited most often as having the final word on system purchases, many users said that a combination of the end-user department, central purchasing department and central DP department came up with the final go-ahead.

Some smaller users noted that top management, managing partners or the president had the final word, while some larger users followed a more complex and well-defined procedure.

In general, users seemed pleased with their small systems, as evidenced by their willingness to stay with minis when their present systems were "outgrown." Very few users chose the alternative of growing into a mainframe when they looked to the future.

Although most users were not as vocal as a coordinator of computer services of a junior college in Massachusetts who said "minis will eventually replace almost all mainframes," many did express their commitment to the small systems in various ways.

Minis 'Underated'

An IBM 5100 user said "minis are underrated as a good solution to the problems of smaller businesses," and a DP manager for a Seattle company noted "transaction-oriented minis are great. They give users control of their systems and the price/performance is outstanding."

Of all those who took the time to reply to the survey there was only one detractor. "We feel distributed processing is a big mistake," this user of several mnis noted. The firm said that when its distributed system is outgrown, the firm will "go on-line to a mainframe."

People with "low education, low literacy and low management skills at remote locations cannot run a small terminal, much less a small computer system," this user added.

N.Y. Halts Software Tax

(Continued from Page 1)

The state will continue to mail out "desk audits," or questionnaries, according to observers, but will cease sending auditors for on-site work.

Presentations by several industry members succeeded in removing the mystique from data processing by succinctly outlining the various aspects of programming, systems analysis and contract programming and explaining the differences and similarities between time-sharing and batch services, observers indicated.

In addition, both David Campbell, vice-president of the Computer Task Group, a Buffalo firm, and Rhoda Minowitz of Queens Data Processing described their plights caused by the assessment of taxes for past years.

Borders on 'Immoral'

Commissioner Lynch agreed with Campbell that his situation, in which the assessment exceeds the net value of his firm, "borders on the immoral."

Miniowitz indicated a $90,000 assessment rendered her unable to sell her business. "How can you buy a business with a $90,000 liability?" she asked.

The Data Processing Management Association (DPMA) was represented by Robert Sherin, president of Nova Computing Services, Inc., and speakers for Adapso were attorney Goldberg, Al Eisenstat; general counsel of Tymshare, Inc. and David Campbell.

Not Quite Right

Jerry Dreyer, executive vice-president of Adapso, called the meeting "excellent" and observed that the moratorium may indicate the state feels something is not quite right with its taxing policies.

The state representatives seemed "very sympathetic to the problem of retroactivity." They also indicated a tendency to view DP as producing a personal service rather than a tangible piece of property, Dreyer observed.

Adapso will once again place high priority on efforts to draft model legislation concerning taxing DP services and software, according to Dreyer.

Cannot Escape

He also said he is not so naive as to believe the industry can escape taxation completely. However, he said what is needed is equitable taxation — the DP industry should be treated in the same manner as other fields, such as accounting.

After the meeting, Lynch invited Adapso representatives to return within a month for another meeting, Dreyer said.

In Survey of 220 Sites

Mini Users Found Critical of Software Support

By Esther Surden
CW Staff

NEWTON, Mass. — Users responding to a recent CW survey had a lot to say about the software support available for their minicomputes — most of it critical.

The survey of over 220 users representing over 800 minicomputers revealed that software support for minis is at best spotty and that levels of support vary from location to location.

Although 75% of users rated their software support as either good or excellent, many of those who called their vendors' support good pointed to problems yet to be solved.

A common complaint was that the vendor had no local software support or the support available was spread too thin. Poorly trained software personnel and software. that was delivered full of bugs were also frequently cited.

No particuar vendor was the target of the criticism. Users praised or complained about large and small vendors alike, including those noted for their user support reputation.

Digital Equipment Corp. came in for its share of criticism from a user who complained of "no commitment to the PDP-8 community." A PDP-11 user was even more vocal, saying that "lousy design, poor language (Basic-Plus) and excuses" characterized his software service.

On the other hand, a DP manager for a Colorado company was pleased with the software support DEC offered and praised the vendor's "involvement and interest."

Criticism of IBM

Even IBM with its reputation for user support received some criticism. An IBM 3/10 user noted that he "purchased an industry application program and the local people were not familar with it."

An IBM 3/12 user said "IBM is no longer playing a major role in support," and still another 3/10 user said "the systems people aren't aware of changes."

In general, however, most users called IBM's support excellent.

A user of both Hewlett-Packard and Digital Equipment Corp. equipment noted there was "no local software support" for his systems. A U.S. government user of HP equipment complained that that "vendor's customer engineers are hardware-oriented, not backed by software support personnel."

A user satisfied with HP's software support appreciated the fact that "software updates" were available "at low cost."

A Peoria, Ill. user of HP, DG and Computer Automation, Inc. minis said that both support and maintenance for his systems were excellent. He pointed to "fast response and willingness to work long hours to find problems" as evidence of this and said that vendor's representatives are always available for questions.

A DG user at a junior college called his support good but "technical manuals are terribly written." The people "are pretty sharp," however, this user stated.

Another user of DG Corp. equipment rated software support as lacking. "Problems with RDOS and DG Basic set back our software house severely, resulting in significant delays in delivery. Fifteen months later, DG adopted TAC-Basic," the DP manager noted. Another DG user said that the software support he received from the vendor was good as the result of "a field-proven operating system and languages including Algol, Fortran and Basic."

'Some of the Worst'

A user in an engineering research company said "Interdata has some of the worst software I have every seen" in response to the software support question. Another Interdata user complained that "they have not provided what they promised" in the software area.

A disappointed Datapoint user said the vendor "is unable to fulfill our technical needs without failures," and a Chicago consulting firm said that sometimes "they know less than we do." Other users rated Datapoint's support as good.

NCR's staff is small and "poorly trained," according to one NCR 101 user, while another user of 34 minis from that vendor said the service and support he has received have been excellent. However, NCR 399's "programs are unwieldy and require excessive computer time," a government user stated.

A Burroughs user rated the vendor's hardware maintenance as good, although the "adequate talent sometimes lacks depth and quick response." He said that software support was poor because the vendor was "seldom willing to accept blame" for malfunctioning software.

Because the vendor "supplied canned software free of charge," a Boston Wang Laboratories 2200 C user was very pleased with the software support and a hospital user of the Jacquard J-100 small business system with multiple terminals called the software support he receives from that vendor "excellent."

Instructor: Ralph G. Berglund.	Dec. 12-13	Nov. 17-18	Nov. 21-22	—	Oct. 20-21
WORD PROCESSING: Guidelines for Planning, Design, and Implementation— An in-depth presentation that encompasses evaluation criteria, techniques of data collection, systems design and implementation. Topics include equipment selection and cost justification. Instructional Staff: Truax, Smith and Associates.	Oct. 12-14 Dec. 7-9	Nov. 9-11	Sept. 26-28 Nov. 30 to Dec. 2	Oct. 26-28	—
EFFECTIVE COMPUTER OPERATIONS MANAGEMENT— Responds to the ever-growing demands of top management for accountable and tightly controlled EDP operations. The most effective methods, procedures and techniques are examined. Instructors: Thomas H. Farello and Michael De Vincenzo.	Oct. 3-5 Nov. 2-4	Sept. 19-21 Nov. 9-11	Sept. 12-14 Dec. 12-14	Oct.12-14 Dec. 7-9	Oct. 24-26
NEW **COMPUTER PERFORMANCE MEASUREMENT: Tools and Techniques for Increased System Productivity**—Features discussions of and work with currently available tools to examine system performance and action plans designed to increase system productivity. Instructional Staff: L. Kreuter Assoc.	Dec. 7-9	Oct. 24-26	Oct. 31 to Nov. 2	Dec. 14-16	—
DATA BASE MANAGEMENT SYSTEMS: General Concepts and Planning Guidelines— Offers a full understanding of the concepts of data base management, and explains what these systems are all about, where their real economic advantages lie, and how to begin. Instructional Staff: DBD Systems, Inc.	Sept. 28-30 Nov. 30 to Dec. 2	Oct. 12-14 Dec. 7-9	Oct. 26-28	Nov. 9-11	Oct. 26-28
MINICOMPUTERS AND MICROCOMPUTERS: Selection and Usage Guidelines— Analyzes today's small computers and how their new roles are changing all the traditional rules of EDP. Guidelines are presented for understanding, selecting, and utilizing today's minis and micros. Instructor: William E. Augustine.	Oct. 13-14	Dec. 12-13	Nov. 17-18	Sept. 29-30	—
NEW **DATA ENTRY AND SOURCE DATA AUTOMATION**— Improve data entry by using the latest methods and techniques. Topics include new key entry technology, transfer of data entry to the source, new management techniques, equipment selection, costs, and more. Instructor: Freeman H. Dyke, Jr	Nov. 30 to Dec. 2	Nov. 2-4	Dec. 7-9	Nov. 14-16	—
NEW **DATA PROCESSING: An Introduction to Concepts and Systems**— Equips the newcomer to EDP with an understanding of what computers can and cannot do, their applications, techniques, modes of operation, how to acquire and apply a computer, and much more. Instructor Elizabeth F Severino.	Oct. 26-28	Nov 30 to Dec. 2	Nov. 2-4	Dec. 12-14	—

System Helping AMC 'Americanize' Engine

DETROIT — The Americanization of a German four-cylinder engine for American Motors Corp. is getting a major assist from a U.S.-built computer.

Recently AMC purchased a complete engine manufacturing plant from VW-Audi, the West German auto producer. However; the facility's machinery and 4,000 drawings for assembly and operation were designed to metric standards and used European electrical systems that operate on different current from those normally used in the U.S.

AMC engineers and DP staff members developed a computer program to speed conversion of the drawings and assembly specifications from the West German standards to those applicable for U.S. operations. Their program runs on a Honeywell large-scale dual Model 66/60 system at the corporate information service center here.

From Richmond, Ind., where the new equipment is being installed, an engineer creates a file on a particular part or circuit using one of 60 electrical symbols stored in the host computer's 512K words of main memory. Another symbol indicates whether the circuit is in series or parallel.

Using a Tektronix CRT, the engineer interfaces "on-line with the Honeywell host over a dial-up, 1,200 bit/sec asynchronous line with synchronous modems at both ends. In the data center, a Calcomp 936 printer produces a rewired schematic complete with interconnections and parts cross-references.

"The part and specifications are added to the data base, a tape is produced and the plotter prepares the finished drawing," according to Joseph W. Balnave, AMC director of the corporate information service center.

"It is then available for recall, update or reference whenever needed; meanwhile, the finished drawings are relayed to Richmond in a one-hour turnaround.

"Previous methods took up to six hours to convert a simple diagram to American standards," Balnave said.

Included with the dual Model 66/60 system is a Datanet 6632 front-end network processor that coordinates communications over 20 lines to AMC sites in the Midwest and East, 10 dual-density Honeywell disk units, eight tape units and two 1,200 line/min printers. Nineteen Honeywell 7700 Series VIP terminals are used in AMC engineering and manufacturing centers.

The Honeywell computers were installed in November 1976 to replace a Honeywell Model 635 and will soon assume current loads running on an IBM 370/145.

To manage the engine's conversion program data base, AMC uses Honeywell's Integrated Data Store/II data base manager. The Transaction Processing Executive software package handles terminal-to-host instructions, while the Network Processing Supervisor drives the Datanet 6632.

ACM '77 Set For Seattle Oct. 17-19

SEATTLE — The Association for Computing Machinery will hold its annual conference — ACM '77 — here Oct. 17-19 at the Olympic Hotel.

In-depth sessions will be offered in areas such as data bases and software engineering, computer graphics, computer-aided-instruction and hardware architecture — for minis, micros and mainframes.

Other sessions will explore computer personnel turnover, the Freedom of Information Act, a data base standardization report and long-range computer planning.

Registration forms and further infomation on the conference and its technical program are available from Harvey Z. Kriloff, technical program chairman at (206) 773-0567 — or James S. Ketchel, general chairman, at (206) 623-4987 or (206) 935-6776.

For information on the exhibits contact Michael Rose at (206) 235-3022 or Lawrence Gaylord, special events chairman, at (206) 655-8892.

There's nothing hard about Sycor software. Our step-by-step approach guides your operator through the maze of data processing procedures. Simply. And virtually without errors.

Even untrained clerical help can become comfortable with it—and productive—after a day or two of familiarization:

The reasons are simple. Sycor terminals and software are operator-oriented. They simplify data entry tasks by greatly reducing the number of keystrokes.

Our step-by-step approach has built-in checks to insure completeness and correctness of data. Since the system assures accuracy, your operators can concentrate on speed.

COBOL, BASIC and TAL II.
Sycor speaks your programmers' language. We now offer multi-terminal COBOL, so your programmers can use one industry-standard language for both data entry and distributed data processing tasks.

We also offer BASIC and TAL II. All three languages can be easily programmed to perform index file look-ups, range checks, calculations and edits of numerical information.

This kind of versatility gives your programmers the software capability they need to customize data entry programs. The result is software that answers your needs for fast, accurate performance.

You can communicate with Sycor.
You can operate in your own communications environment using Sycor software. We have BRJE, remote job entry software that operates in a Burroughs communications environment, and IRJE, for interactive remote job entry needs in an IBM environment.

For your multi-leaving applications, Sycor has software that can handle your HASP work station requirements. We also offer spooling, powerful systems utilities and command chaining to help get your jobs done as quickly as possible.

Rather Than 'After the Fact'

DP Audit Role Seen Needed Early in Projects

By Frank Vaughan
CW Staff

HOUSTON — DP auditors should become involved with systems while they are under development, rather than "after the fact," especially since most management has stopped looking at the audit function as a review of historical events.

Michael I. Sobol, DP audit supervisor for the Gillette Co. in Boston, made that observation to a recent gathering of the EDP Auditors Association here.

Another reason for auditors' involvement during development is that it is less costly to develop controls up front than to go in after the fact.

In addition, systems development people are less sensitive to audit involvement, and proper "hooks" can be designed and built into the system to reduce audit involvement and time in future system audits. These "hooks" may include special audit reports, special control totals or an integrated testing facility, he explained.

Auditors who are going to be involved with systems under development must have a formal written statement of audit responsibility. A verbal expression of management support is not enough, Sobol said.

Communications is extremely important, he noted. Auditors must be provided with immediate and long-range plans, status reports and other important information. Verbal responses in many areas are insufficient and DP managers should expect requests for formal communications.

It is especially helpful if the auditor is allowed to review the DP department's correspondence file and is placed on the distribution list for project correspondence, he suggested.

Total Involvement

At project initiation, the audit interface is limited. The project initiation report should be reviewed for informational purposes on all high-risk projects and selected medium-risk projects.

When the project reaches the business proposal stage, the problem specification report should be examined for all high-risk and certain medium-risk projects. The audit response at this point should involve limited comments on control features that should be included in the system design report, he said.

The main audit concern during the detailed systems design phase of the project should be with the design of the security and control features. Depending upon the system risk, involvement may vary from total participation on a high-risk project to general controls review for low-risk systems.

During the programming stage of the project, the auditor may be required to spend 25% to 40% of his total time expenditure on the project. Involvement is required in program testing and review, systems testing and review and conversion control.

Parallel Implementation

Following successful system testing, data center implementation and user implementation usually proceed in parallel, Sobol said. The auditor is primarily concerned with the adequacy and completeness of the operational documentation and systems documentation.

He will also want to make certain that user departments receive proper education and training.

The auditor does not usually take part in the final project reviews, but should receive a copy of the final report.

BASF invented magnetic tape 40 years before Memorex broke their first glass.

Back in 1932, when Hoover was still president and radio was the big noise in home entertainment, BASF invented magnetic tape and the technology that made today's high-density data processing media possible. The state of the art has evolved considerably since then, and we're no longer alone in the magnetic media field. That's why, while we know we were first, we'd rather you know that we're the best. And we've put more effort into being the best than anyone else in the business. That's why we design and manufacture our own testing apparatus, and why we use up 75,000 miles of computer tape every year in our development department. Because at BASF, "good enough" just isn't good enough. We've been around for a long time . . . long enough to know that it's what we've done for you lately that counts. Ask our customers . . . most people who choose BASF make it their only choice. BASF Systems, Bedford, Massachusetts 01730.

Data Control Seen as Basic Management Goal

By Molly Upton
CW Staff

TORONTO — Maturity in data processing will be reached when "management is as comfortable with managing data resources as with managing money or material resources," according to a paper prepared by Richard L. Nolan of the Harvard Business School.

First, however, management must focus on managing data rather than concentrating solely on the CPU and related hardware, Nolan said in his paper, presented at the International Federation for Information Processing (Ifip) Congress 77 here recently.

The paper presented a starting point for a panel discussion on ways to implement the concept of data resource management. Some of these ways include a charge-back system based on a value-added concept, implementation of data base technology, implementation of data administration functions and the dispersal of functional analysts and programmers into user departments, according to Nolan's paper.

Nolan expanded from four to six the various stages of DP management, from the inception of DP to maturity, to reflect the assimulation of data base technology. The first four stages involve building applications, the DP organization, DP management planning and control and developing user awareness.

With data bases facilitating the separation of data from individual programs, the DP department can manage the data resources of the firm and the user/managers can manage the functions, such as processing and payroll, the paper indicated.

Prediction for 1980

Nolan predicted that by 1980 three types of computers will comprise the typical DP installation: a data machine, a processing machine and a control machine.

The data machine will handle management of the organization's data and will be linked with the data bases. The processing unit will perform value-added functions of "combining, mutating and distributing data to produce information," the paper said.

The control machine will provide accounting, scheduling and monitoring as well as billing.

To accompany the changing technology, the organization structure will include a senior executive, probably a vice-president, with two line functions of data administration and data processing. The latter will be similar to current sophisticated operations activities, but functional systems analysts and programmers will work with the user departments to develop programs that reflect the user's needs, the paper said.

In a brief explanation of the chargeback scheme, Nolan's paper indicated users would be charged for the cost of the data plus the value-added services of processing it.

Walter Carlson, corporate marketing consultant for IBM, expressed skepticism that the DP installation would be as Nolan described it by 1980; he said, perhaps it will be within 10 years.

He agreed the real question is how long it will take people to realize DP revolves around data rather than the CPU.

Through a statistical analysis of customer records, IBM has deduced that a small sample is arriving at Nolan's fifth and sixth stages, and an even smaller fraction is going toward greater end-user involvement in the shape of distributed processing.

Carlson asked how Nolan is going to explain that phenomenon.

Although he agreed with the concept of charge-back for data on a value-added basis, he warned this should not be left to accountants. Such an intangible subject as data, which can be possessed simultaneously by more than one entity, will "drive accountants up the wall," he said.

Perhaps some dramatic proposal — such as the DP department paying a price for the data it uses and charging customers for the data it delivers — should be suggested in order to start the use of this scheme. Possibly one could estimete the latter charge by calculating the expense that would be incurred by the using department if the DP department didn't exist and dividing that sum by some number, he suggested.

Carlson would place the DP resources controller outside of the DP department and under the corporate controller or in each of the firm's profit centers.

The proposal for a DP resources controller is "the key to making the DP department an efficient and respected partner in corporate goals," he said, urging experimentation with the concept.

Irwin Sitkin, vice-president of corporate DP at Aetna Life and Casualty, commented there will be more stages of growth. Perhaps there are four rather than six, with the four being repeated. "It's not important how many stages there are, but you do need a feeling for where you are," he said.

Aetna has been shifting emphasis from managing hardware to managing data, he said.

Samuel Kahn, manager of the information system department at E.I. DuPont, said he felt corporate management had been allowed to abdicate the responsibility of managing DP. "We have failed to convey the idea that DP is a technology that can be managed like any other technology," he said.

Everyone's Going To Georgia, U.S.A.

Why Should You Attend INTELCOM 77?

Everyone that's interested in Telecommunications is headed for Georgia October 9th to 15th. Why are they going to Georgia? To attend the first International Telecommunications Exposition to be held in the United States. INTELCOM 77 will be held October 9th to 15th and will include Technical Programs, Financial Seminars, Applications, Mini Telecommunications "University" Courses and 250 of the World's largest communications manufacturers exhibiting the most up-to-date equipment in the world today. . .along with live demonstrations to show you how it works. All segments of the Telecommunications Industry worldwide will be there. You'll hear experts analyze today's and tomorrow's trends in computers and telecommunications technology, and you'll see what's available today and what's coming tomorrow. . .all in one short week in Atlanta, Georgia, October 9th to 15th.

Meet informally with your peers from around the world. In addition to a large contingency from Canada and the United States, there is already a number of delegates coming to INTELCOM 77 from such countries as U.K., France, Germany, Italy, Spain, Belgium, Sweden, Greece, Turkey and Israel in Europe. From Eastern Europe, we have delegates from U.S.S.R., Hungary and East Germany. From the Far East, there will be delegates from Japan, Australia, Hong Kong, Indonesia and Korea. Over 12 countries from the Middle East will have delegates at the Exposition, as will 8 African countries. South America will also be represented at INTELCOM 77.

Simply run your eye down the column pertinent to your telecommunications function. If at least two areas of Intelcom 77 apply to your work, attendance at Intelcom 77 will more than pay for itself in short order.

Pinpoints Partner Attitudes

Word-Analysis System Examines Marital Flaws

By Jeffry Beeler
CW Staff

DES MOINES, Iowa — If your marriage is on the rocks or just heading that way, perhaps you can get the expert counseling you and your spouse need from a series of computerized word analysis programs.

Dubbed the Marital Climate Inventory (MCI), the three programs help marriage counselors and professionals in related fields pinpoint the source of problems in husband-wife relationships, according to Dr. Charles Cleveland, president of Grey Matter here, which developed the programs. Grey Matter also uses the programs to counsel engaged couples, Cleveland added.

The programs analyze troubled marriages by asking husbands and wives to answer 58 open-ended questions dealing with nine topics — love, sex, money, relatives, communication, religion, selfishness, children and freedom. A Control Data Corp. 415 keypunch unit is used to convert the results usually totaling about 1,000 words) into machine-readable text, which a 49K-byte CDC 6400 scans and compares against a computer-stored lexicon of 15,000 frequently used English words.

Interpreting each word in the responses, a Grey Matter program identifies the main attitudes characterizing the couples' relationships and reports its finding on 10-page printouts.

With their knowledge of how certain attitudes correspond to various degrees of marital harmony, Cleveland and his colleagues can then assess the emotional health of their clients' relationships and spot major flaws.

Field Tests

In field tests at the University of Iowa, Grey Matter's computerized diagnoses agreeed 91% of the time with the independent findings of three practicing marriage counselors, Cleveland claimed.

Besides marriage counselors, typical customers of Grey Matter's word-analysis programs include clinicians, physicians, lawyers and the clergy.

The programs particularly benefit clinicians, Cleveland says, by allowing them to diagnose marital ills after only one or two meetings with their clients. This is important because couples seeking marriage advice frequently become discontent and discontinue their counseling if clinicians do not quickly identify the cause of their domestic woes, he explained.

In addition to the other hardware modules, Grey Matter's configuration incorporates a Cyber 74 mainframe, a CDC 844 disk drive, a CDC 501 printer and a CDC 604 tape drive.

ICCP Extends CCP Deadline

CHICAGO — The deadline for registering for the Certificate in Computer Programming (CCP) examination has been extended from Aug. 31 to Sept. 15.

The examination, which is being offered by the Institute for Certification of Computer Professionals (ICCP), is being given on Oct. 22 in over 100 colleges, universities and test centers around the world.

Study guides for the examination may be obtained from ICCP's New York Office at 304 E. 45th St., New York, N.Y. 10017.

Register Now For CDP Exam

CHICAGO — The Institute for Certification of Computer Professionals (ICCP) has begun accepting registrations for the Certificate in Data Processing exam, slated to be administered on Feb. 18.

Applicants will automatically receive a study guide containing a new outline for the test. Applications and fees must be submitted to the ICCP by Dec. 15.

Send requests for applications to 304 E. 45th St., New York, N.Y. 10017.

Computer Selection

Make sound management decisions based on computer selection techniques developed by Dr. Edward O. Joslin, a leading authority in the field.

INDEXED
216 pages $20
ISBN: 0-89321-201-6 1977 Hardcover

This book presents a systematic approach to resolving management problems in computer selection. Demonstrates practical methodologies. Shows business managers and computer professionals how to avoid common mistakes and how to establish cost-saving procedures when selecting computer systems. The contents of the original edition, already a classic in business, industry, government, and academia, are now further enhanced in this *Augmented Edition* by the addition of *Five New Chapters*. These provide essential information about *The Role of Management, Requirements Costing, Procurement Plans, Workload Descriptions,* and *Small Computer Systems*. In the *Foreword*, the author is referred to as "a pragmatist and a theorist in his area of expertise."

Editorials

First Things First

The governmental stamp of authenticity has descended on the information industry with a dull thud.

Confirming what members of the DP community have known for a long time, a Department of Commerce report claimed that the total "information sector" accounted for 46% of the U.S. Gross National Product [CW, Aug. 22].

What makes the percentage more impressive is the fact that it was based on 1967 statistics. Without doubt, this figure has grown in the last 10 years.

Recognizing that the U.S. is moving from an industrial society to an information society, the Office of Telecommunications report calls on the executive branch to formulate a national information policy. Part of this policy would be to "adopt a prospective look at future applications of information technology," the report said.

The implications of a national information policy include the use of information (and the the ability to convey that information) as an instrument, perhaps, in international diplomacy. A rudimentary beginning to this type of information use may lie in the standards struggles now associated with the interconnection of national public data networks on an international scale.

The unfortunate part of such forward thinking is that the global issues are surfacing before the primary issues have been addressed. A society that has not yet decided how it can guarantee individual privacy against the onslaught of ever-enlarging data bases is now called upon to formulate information policy.

There is no doubt that the ability to gather and process data will become increasingly important in the years to come. It is probably inevitable that nations which become sophisticated in manipulating and moving this information will have a significant power.

But a national policy for dealing with information will be successful only after the rights of the individual have been ensured against unwarranted intrusions into personal data.

A society dedicated to the use of information for the common good should not hesitate to limit the uses of data gathered from the private sector.

No Easy Answers

The computerization of a job may have a dehumanizing influence on the worker. This was one of the findings presented at a session on job satisfaction and computers at the recent Ifip Congress.

It is not surprising that workers feel less in control when their jobs become automated. But this means there is more to achieving worker efficiency than simply installing a computer.

One of the panelists at the session told of bank tellers who no longer considered themselves "bankers" after they began to work with an automated system.

There are no easy answers to these types of peripheral problems.

It is hard to argue that computers should be used sparingly and only when they do not dehumanize the workers involved.

Some type of management assurance might have to be given that the machine will never replace the reasoning power of the worker.

In some cases, problems have been avoided by involving the workers who will be using the system in helping to design it.

There has been much discussion in the past of whether computers actually replace people. Perhaps the real issue all along has been whether the computer leads the worker to assume the role of a disinterested onlooker.

Data Past

Five Years Ago
Aug. 30, 1972

BETHESDA, Md. — A government advisory committee was told here that it might be too late to stop the trend toward the use of the Social Security number (SSN) as a universal identifier.

While no conclusions were reached, witnesses before the committee, formed by Secretary Elliott Richardson of the Department of Health, Education and Welfare, described planned or already-implemented computer files with the SSN as chief file access.

— — —

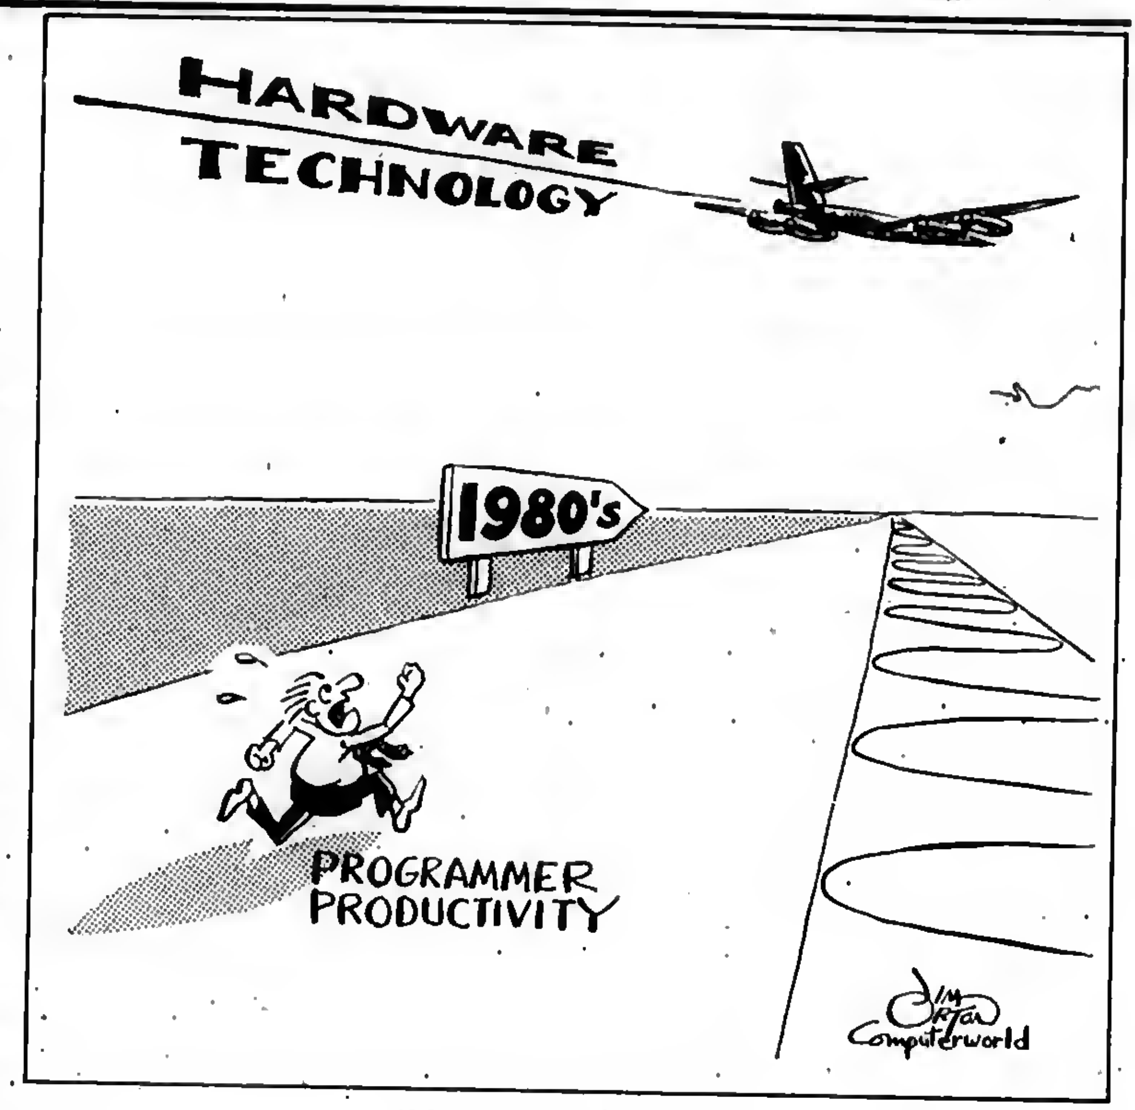
SAN FRANCISCO — Itel announced a 7305-2 fixed-head file that was plug-to-plug compatible with the IBM 2305-2; a 7305-3 file that offered slightly lower performance; and a 7835 control unit, compatible with the IBM 2835.

Eight Years Ago
Sept. 3, 1969

WHITE PLAINS, N.Y. — IBM introduced the 54-nsec system 360/195. The company described it as big, very fast and priced to offer users more for their money than large-scale systems made by other companies. Delivery was scheduled for 1971.

— — —

LOS ANGELES — Computer Sciences Corp. announced it would offer a broad range of facilities management services, including equipment installation, checkout/testing and maintenance. The services were being offered to users as an alternative to hiring IBM's field and systems engineers.



'Hey, Wait for Me!'

Letters to the Editor

Credit Should Go to RCA

How quickly we forget! The Aug. 8 editorial, "New Heyday Coming?", stated that Amdahl is "generally credited" with the "concept of the alternative system."

My associates and I vividly recall that RCA was the first to offer (and sell) CPUs that would run IBM operating systems. That was back in 1970, before many folks knew how to spell Amdahl.

Jerry B. Nesmith
Atlanta, Ga.

Unfair to Withington

The headline on page 3 of the Aug. 8 issue as well as the first paragraph are unfair to Frederick Withington. To suggest that his reluctance to testify against IBM stems from his contractual relations with that company is laughable to anyone who knows the gentlemen, but unfortunately may affect his reputation to those who don't.

The issue in the case was whether the govenment, in it efforts to show IBM monopolized the industry, had the right to force an expert to disclose in court the knowledge he gained from his employment without agreeing at the same time to pay an expert's fee.

The Court of Appeals in New York noted that Withington had agreed to testify but later declined at the direction of his employer, Arthur D. Little. The court also noted that questions of conflict of interests were considered before ADL appealed.

The issue, said the Court, was well stated by Withington when he said "the government is seeking the very core of my expertise which I do not wish to provide and which I consider to be a proprietary asset available solely to my employer or to those for whom I wish to work."

For CW now to imply that Withington's real reason for protesting the government action was that he owned IBM stock and had received payments from IBM as advances for a book to be published through Addison-Wesley, his longtime publisher, does dishonor to an honorable man.

Satisfied Micro User

As a dedicated computer hobbyist and professional programmer, I read with dismay E. Dijkstra's statement that micros produce unreliable output ["Micro Programmers Seen Facing Old Problems," CW, Aug. 15]. I speak from personal experience when I say that the output from micro-based systems is at least as reliable as that from a large system.

My own micro, built from a kit, has enjoyed a perfect record of performance in the eight months it has been operating.

I think the reliability problems we hear so much about are mainly caused by unfamiliarity with kit building or using the cheapest available parts instead of the best.

I. Barron's statement, quoted in the same article, that "What is really needed is a 4- or 5-bit word length" appears to be the result of rather fuzzy thinking. The 4-bit word is available in the 4004 processor from Intel, but I don't see very many people using it in computers.

If we went to 4-bit words, what would happen to the magnificent APL character set? Efforts in computer graphics and artificial intelligence would be crippled by Barron's suggestion.

Automated Physician Seen Design Fantasy

By Jack Stone
Special to CW

Surely all of us will speculate on the real utility of computing systems in medical practice if we have to enter a hospital for diagnostic or therapeutic procedures. One conventional style for reporting on the effectiveness of the technology in this area is to interview a well-known physician who has had great success in using it.

But circumstance provided me with an alternative — extended informal discussions with articulate members of the new generation of medical practitioners.

A few weeks ago, I traveled to the Rangeley Lake region of northwest Maine; I had been invited there to catch up on some writing commitments and enjoy the beauty and serenity of the area. It was a serendipitous event when I met two of the other houseguests.

One was Karen Hendrickson, a 24-year-old registered nurse from Washington, D.C.'s George Washington University Hospital, a facility associated with the George Washington Medical School. The second was her escort, Gordon Anderson, 28, a third-year medical student at George Washington.

We talked about many aspects of their careers, including subjects of professionalism, humanism and ethics in the practice of medicine. Karen and Gordon easily related to my questioning regarding the role and potential impact of computers in medicine. Here is a relevant distillate of our converstions:

Question: Where do you feel that computer technology has been particularly helpful to the medical profession?

Karen: Computer-based instrumentation in emergency situations has been of inestimable value. It has assisted physicians in saving many lives because it provides physiological information very quickly.

Question: Do questions of instrumentation accuracy or reliabililty give you cause for concern?

Gordon: Not really. We all recognize we're dealing with machines which, although they are expertly engineered, will break down from time to time. The equipment is always under the watchful eye of a trained person who has the experience to react to a machine malfunction.

Oh, I'm sure that human and machine errors have been made, but the net of it is that many, many more lives have been saved with the equipment than have been lost.

Question: How about outside of emergency situations?

Gordon: New computer-based systems are regularly arriving in hospitals today because of the falling costs of hardware. For example, computer-controlled X-ray scanning instruments are providing answers to medical questions which previously were available only from exploratory surgical procedures.

As another example, hospitals use computer-based patient monitoring equipment in the intensive care units. This gear allows continuous monitoring of a group of these patients by a relatively small number of medical personnel, thus releasing highly skilled people for other crucial assignments, a goal of great concern to most hospitals because of shortages of personnel in this category.

The Human Connection

Question: How about the uses of computers in the educational process?

Gordon: We have remote access to a comprehensive computer-assisted instruction [CAI] system from a terminal in our library. Our CAI provides literally hundreds of hours of tutorial drills in such subjects as anatomy, physiology and biochemistry. I only wish I had more time to spend at the terminal.

Question: What do you think is the area of greatest need for computer support?

Karen: That's easy — automatic storage and retrieval of patient medical records. These records are typically unsorted pieces of many different forms, haphazardly filed.

Frankly, the records are in such a mess that, in the interests of saving time, doctors and nurses are often forced to repeat medical history interviews and lab tests, which naturally result in more trauma for the patients and more cost to the hospital.

Question: There is speculation about the completely automated doctor — over a machine which interfaces directly with the patient, conducts the history interview, makes the diagnosis and dispenses the medicine. What are your comments on this possibility?

Gordon: If such a machine were built, I guess I would keep an open mind before I accepted it or rejected it for my practice. But I would surely want to carefully study the results from tests by research and clinical physicans, as well as patients' comments, before I ever used it with my patients.

You see, I believe in the treatment of the whole person, trying to understand and respond to not just the physical ailments, but to the patient's emotional and social problems. This philosophy is of growing importance today, since perhaps 70% of the people visiting the doctor's office have symptoms derived from other than purely physiological causes.

A successful treatment program of this kind is strongly dependent upon proper diagnosis, which in turn is dependent upon the willingness of the patient to communicate symptoms accurately.

Based on what I know now, I feel that it will be a long, long time before human affections are machine-programmable.

Kahn's Ideas Reduce Overbooking's Damage

Overbooking by the airlines is a computer optimization problem that is continuing to plague the public. Alfred Kahn, the new chairman of the Civil Aeronautics Board, understands the concepts of optimization as well as any DPer.

However, in his personal set of equations for the optimization function, Kahn includes certain variables not often included by systems designers.

The Taylor Report
By Alan Taylor CDP

He includes, most importantly, factors that measure the amount of damage to society — and then seeks to minimize that damage. This factor may well be the most important missing variable in innumerable computer applications.

It is therefore not surprising that the answers Kahn comes up with differ from the ones that others develop. A measure of this difference was evident in one of Kahn's first press conferences.

At that conference, he suggested a different approach to solving the overbooking problem, an approach that minimizes the damages while retaining the advantages of overhooking.

Kahn brings the passengers into the equations by suggesting they have a say in the matter. In his off-the-cuff comments, he suggested offering $100 to any passenger who volunteered to be bumped from a flight.

Dutch Auction

Another idea — that the pilot conduct a type of Dutch auction before take off to get enough passengers to deplane — is interesting enough to follow through beyond the simple monetary amount Kahn suggested. Many passengers are not going to stop flying at the end of one leg of their journeys, so they could be offered alternative routings to their final destination, as well as the compensatory cash.

Other passengers flying on some of those odd connections — the ones that can keep you in the air for eight hours at a stretch without more than repeated peanut snacks — might well fall for a deluxe dinner.

The number of positive inducements that can be offered to encourage deplaning would be limited only by the imagination of the auctioneers.

Negative inducements — items which would make deplaning very unwelcome — could also be figured into the equations. For instance, a passenger's worry about the people who will be waiting at the airport to meet him is a most powerful deterrent to deplaning. An airline that used its own resources to track down and inform those people would be way ahead — particularly if there was some form of hospitality offered to those meeting bumped passengers.

Yet another way to reduce the social damage from overbooking might be to exclude certain passengers even from being asked to volunteer to deplane or from having to take part in a lottery. Grandmothers traveling to grandchildren's weddings, anyone going to a funeral, children flying to their parents, for instance, could reasonably be given preference on a flight.

All of these methods — positive inducements, negative inducements and priority rankings — can by their mere exercise reduce the social damage of overbooking. Even if a person is bumped from a flight, the damage is reduced because he knows that he and the other passengers have made the decision jointly with the airline, rather than having been the subject of an arbitrary act by itself.

The Ultimate Situation

One of the problems with the Kahn technique would be in identifying the ultimate problem size. Currently the figures show thousands who are unable to reach their destinations within four hours — but the figures are silent regarding the number who are drastically disturbed by late arrival, be it two hours or 12.

Yet it is in the number of really serious events (such as the Ralph Nader bumping) that the problem really exists. If there is a serious situation, such as the last flight out on Christmas Eve where no one wants to be bumped, even for $200, then some decision has to be reached. Presumably a lottery would choose the unlucky one — but the need to hold such a lottery would, of course, be a reportable event.

Naturally, the question of whether overbooking of that specific flight (as opposed to other flights) was proper could be looked at, and hopefully if the same situation recurred the algorithms would take the cause into account. In fact, the very existence of "ultimate situation" reports would indicate a variable missing from or miscalculated in the current algorithms. And finding missing and incorrect variables is exactly what any proper optimization technique should do.

The Kahn approach, therefore, could operate to optimize situations in a way we currently do not. As well as looking at the social dangers, it also improves the technical situation. And that's an excellent result.

'I'd Flunk CDP Miserably'

Letter to Lord From Rigo: 'Sorry, No Deal'

By Joe Rigo
Special to CW

Dear Ken Lord,

Thanks for the offer, but it's no deal.

I read your challenge to me in the July 25 issue of this paper to take and pass the exam for the Certificate in Data Processing (CDP). Now, the exam may or may not be any good, but on one point you are absolutely right: I would flunk it miserably.

I can say this with some authority. I've been flunking tests like this for years.

This is one reason why I am so opposed to the CDP and to its illegitimate stepchild, the Certificate in Computer Programming (CCP). If I ever have to pass one of these things to keep my job, it will be the end of a beautiful career.

My problem, alas, is that I have become an old man. It is not that I turned 44 a couple of months ago. The important figure is that I have been in data processing for 13 years now.

Tests like this are for kids just out of school. Kids are equally ignorant in all areas. Their heads are filled with useless facts. They can remember the difference between AND and OR without looking it up.

Reader Commentary

My brain is pockmarked with hills and valleys. Things like AND and OR are hidden away with my sixth grade lists of the major exports of South American countries.

A lot of us old people are like that. We remember what we need for today's job, and we learn what we will have to know for tomorrow's. The rest gets rusty.

Then there is the question of motivation.

Admittedly, I could improve my chances for the exam by hitting the books. But what's the point?

I have been around for a while. I have a track record. Good or bad, the products of my work are available for inspection. Even worse, there are living witnesses who will blab the truth to anyone who asks.

Acquiring a CDP would do nothing to improve my failures or reduce my successes. It certainly would not inspire any of the witnesses to change their minds.

Finally, let us consider whose leadership I would be following.

There can be no question that some very good people have acquired a CDP. I have purchased the Brooklyn Bridge myself a couple of times over the years. But let's not confuse the buyers with the sellers.

Consider for a moment the words of the Chief Professional Prof. G. Gary Casper, CDP.

Casper is one of your people, Ken. He is this year's president of the Institute for the Certification of Computer Professionals (ICCP). He is in charge of peddling certificates to an industry that seems to get along very well without them.

I quote from his article in the July issue of *Infosystems*:

"The trade and technical press, convention speeches and publications of the professional societies are full of examples of massive and pervasive incompetence on the part of computer practitioners . . .

"An even more appalling situation is that our computer systems are designed, implemented, operated and controlled by people who virtually lack any commitment, social responsibility or ethical control. The only responsibility many of these people accept is the periodic gathering of a paycheck."

Now be honest, Ken. Do you really expect me to do business with a guy who goes around saying that my friends and I are nothing but a sleazy bunch of bums?

As an alternative source of leadership, let me throw out the name of Carmine Vona.

I worked with Carmine a few years ago at one of the large banks in New York. I like to think of him as a chief programmer in the best sense of the term. He prefers to be classified as a systems analyst, but that topic is for another article.

Carmine was a professor of nuclear physics in Italy. He worked there for IBM for a while, spent a year teaching school in northern Brazil and eventually made it to the U.S.

When I knew him, he was dragging the bank, kicking and screaming, into modern systems design. He investigated the application, designed the system and supervised the analysts and programmers who implemented it.

When he says the next project phase will take X weeks and cost Y dollars, you can set your watch by it.

Carmine drives his people mercilessly, but everyone wants to work for him. Somehow he always finds time to drill some of the fine points of system design into the head of a young programmer.

I have never heard Carmine say a bad word about anyone. He makes everyone around him look good. His managers are constantly getting promoted. His systems work, and his users love him.

Carmine does not have a CDP. He is not active in any of the professional societies. He does not attend industry conventions or user group meetings. He works like a demon all day on the job, and he goes home to his family in Brooklyn at night.

Alas, I am no Carmine Vona. I am up to my eyeballs in professional associations. I look forward to meeting old friends at the conventions. And I am hopelessly addicted to writing these occasional articles for CW.

But I still have a few years to go.

Chief Professional Casper and his ilk can go on ranting about how rotten we all are. You can have him, Ken. You can also have the CDP, the CCP, the code of ethics and Professionalism.

I just want to be like Carmine Vona when I grow up.

Letter to the Editor

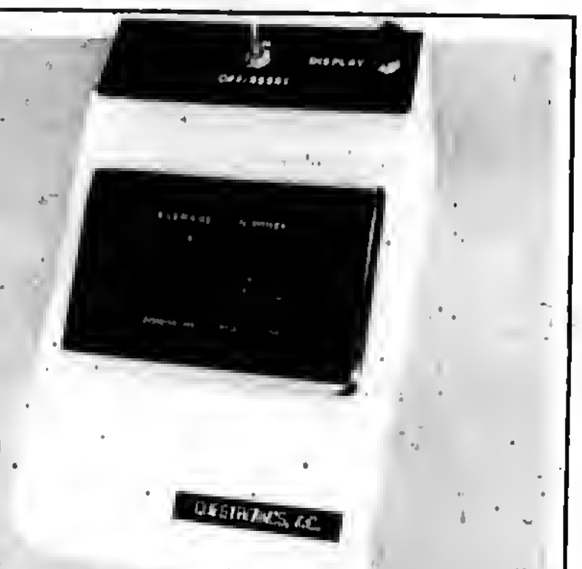
Chess Schedules at Ifip

I must correct an implication of the caption to the Aug. 15th front-page photos of the chess tournament at Ifip Congress 77.

The caption reads "Some played games as others crowded into technical sessions." In fact, the chess tournament was held entirely during hours when no technical sessions were being held. One could watch all the chess games and still attend a full schedule of technical sessions.

Daniel Glazer
Washington, D.C.

Terminal response time diagnosis.



If you suspect response time problems, find out for sure. Get the real response time with a TERMINAL RESPONSE TIME MONITOR. This is a hardware monitor that measures the average, minimum, and maximum response time along with the number of transactions. Terminal connection is by optical coupler which eliminates internal probe points. Operation is unattended and automatic. Price: $950.

For more information contact: QUESTRONICS, INC.
3596 South 300 West
Salt Lake City, Utah 84115
(801) 262-9923

Now from Digital– a low-cost paper tape reader.

digital prs01

The PRSO1, Digital's new low-cost, portable paper tape reader for high performance terminals.

Now you can easily load your programs, bootstraps and diagnostics into any make or model of computer or terminal you currently own through an approved 20 mA interface. Available in 300 baud and 2400 baud versions, the small (12"x8") and light (3kg) (6.5 lbs.) self-contained unit can go just about anywhere you need an input device. All for a mere $750.

For complete information on the PRSO1, call your nearest Digital office; or write Digital Equipment Corporation, Traditional Products, 125 Northeastern Boulevard, Nashua, N.H. 03060.

Help Wanted

A special report on Data Base Management Systems (DBMS) will be part of the Oct. 31 issue. We welcome suggestions on topics to be covered and user-written articles describing experiences with the systems.

Write-ups should focus on problems and solutions affecting any part of the user's expectations, selection, implementation or use of the DBMS — or, if appropriate, why the project failed.

Contributions should not exceed 1,200 words (four or five double-spaced pages) and should reach Don Leavitt, Computerworld, 797 Washington St., Newton, Mass. 02160, by Sept. 24.

Names Asked For CPE Prize

WASHINGTON, D.C. — The annual A.A. Michelson award recognizes a significant contribution in the realm of computer performance evaluation (CPE). Nominations for this year's award are now open and suggestions from anyone "would be most welcome," according to selection committee chairman Phil Kiviat.

Presented by the Computer Measurement Group (CMG), the 1977 award will be made in late November when CMG holds its annual meeting. This year the meeting will be held jointly with the Association for Computing Machinery Special Interest Group on Measurement and Evaluation (Sigmetrics).

Started just three years ago, Michelson awards have gone to Kenneth Kolence, Thomas Bell and, in 1976, to Kiviat.

The names of award candidates and summaries of their accomplishments should be submitted by Sept. 15 to Phil Kiviat, Technical Director, Fedsim, Washington, D.C. 20330.

Annual Survey Finds

'Average' DOS Site Has 135

By Don Leavitt
CW Staff

MINNEAPOLIS — The "average" IBM DOS installation has a purchased 370/135 with 3340 disk drives. The most popular software products are Cobol, Power, CICS and Dbomp — all from IBM — and Panvalet from Pansophic Systems, Inc. These are among the conclusions of the latest annual survey of the Minnesota DOS Users Group, according to Tom Teresi, president of Advance Computer Systems Co. and former president of the group.

Adamantly independent of IBM, this group is one of the largest and most active organizations of its kind in the country. It has over 300 members, many of whom are from the upper Midwest. In addition to conducting the annual survey, the group holds monthly meetings to discuss common problems and, hopefully, solutions.

"This year's survey was our largest ever. We had 160 installations representing 175 IBM 360/370 CPUs," Teresi said. "All machines supporting DOS or DOS/VS were represented. They ranged from a 360/22 with 32K to a 370/158 with 3M bytes (real). We even had a response from a [Control Data Corp.] CDC 480 site.".

Detailed survey results were provided free to members of the group who completed a questionnaire on their installation.

Some Surprises

The results contained a number of surprises. Most notable, as far as Teresi was concerned, was the finding that only 67% of the installations have 370s installed; one-third still had only 360s.

Equally distressing to IBM must be the fact that only 21% of the on-order 370 CPUs are replacing installed 360s. "There is no joy in Armonk over these conclusions," Teresi mused.

"Evidently the 360 series continues to offer a good bang for the buck. The 360 users' resistance to upgrade has forced IBM to make improvements to the 370 line (e.g., VS, 138, 148). Similarly, improvements in the 370 line have brought about significant price reductions in the 360 series.

In the software category, only one product was able to command a larger following than the IBM alternative. Panvalet was the most popular source library system, even surpassing the free source statement library facility of DOS.

However, IBM's hardware and software products were the most popular in all other categories. Of the 87% who spooled, nearly three-fourths used IBM's Power. Fully 50% of the teleprocessing uses chose CICS. Surprisingly to Teresi, only 60% of the users reported having an on-line system.

A data base system was used by 43% of the users. In what turned out to be a close "race," IBM's DL/1 with 15 installations edged out Total from Cincom Systems with 12 users. However, neither package could match Dbomp with 29 installations.

As expected, Cobol is used as a primary language at 65% of the installations.

Further information about the group's meetings or the survey is available from Teresi at Advance Computer Systems Co., 3333 Regent Ave. N., Minneapolis, Minn. 55422.

APL-Based 'Quickplan' Helps Financial User

BETHESDA, Md. — The APL*Plus Quick Planning (Quickplan) system, now on the Scientific Time Sharing Corp. remote-computing network, is designed to help in corporate planning and reporting, according to a network spokesman.

The vendor sees Quickplan as particularly useful in generating a variety of financial reports including balance sheets, income statements, budgets, spread sheet analysis; forecasting, sales projections and lease/buy analyses.

Although the system is based on APL, little or no knowledge of that language is required to use Quickplan. Most of the user's responsibility lies in responding in English to the system's requests about what data is wanted and where it should be placed.

The system supports the naming and positioning of page headings and column titles in that way as well as the assembly of data from existing files. Simple mnemonic operators give the user basic tools to define what fields or lines are to be accumulated for subtotals and totals.

In some cases, the system calls on the user to indicate which of several possible choices he wants Quickplan to follow by keying in one of APL's special symbols, but its use in such a situation is unrelated to the symbol's conventional use within APL.

Practically the only time the user needs to be aware of how APL works is when the report program and, if desired, a calculation program to determine new values from givens, have to be brought into "workspaces," a concept unique to APL, before they can be used.

Scientific Time Sharing Corp. is headquartered at 7316 Wisconsin Ave., Bethesda, Md. 20014.

IF YOU'RE MAKING FINANCIAL DECISIONS WITHOUT TIMELY INFORMATION, YOU NEED THE MMS GENERAL LEDGER.

When your financial management makes decisions without accurate, timely information, they might as well be blindfolded.

But you can give your decision-makers *all* the information they need, in any format they feel comfortable with, and deliver with fast-ball speed.

All you need is the MMS GENERAL LEDGER. The proven financial reporting system, it's scoring an impressive record in more than 800 major corporations around the globe.

A data-base system, MMS GENERAL LEDGER knows how to handle all the league-leaders, including DOS, O/S, IMS, IDMS, DL/1 and TOTAL.

If your requirements need a heavy-hitter, the MMS GENERAL LEDGER is available with an additional *ON-LINE MODULE* that makes financial reporting a whole new ball game.

Best of all, MMS GENERAL LEDGER is only one member of Software International's all-star team, which features Accounts Receivable, Accounts Payable, Net Change MRP, Filetab Report Writer and three for Systems/3 — General Ledger, Accounts Payable and Accounts Receivable.

When the pressure is on and you can't afford mistakes, call or write Software International. Get the champion performer, MMS GENERAL LEDGER.

Take me out to a whole new ball game of financial reporting. Please send me more information about:

☐ MMS General Ledger
☐ MMS Accounts Payable
☐ MMS Accounts Receivable
☐ Net Change MRP
☐ Filetab Report Writer
☐ S/3 General Ledger

DEALERS...AJ WANTS YOU

Anderson Jacobson, a leading manufacturer of data communications products, would like to introduce you to our new minicomputer, the AJ System 1500. And we need your expertise to make our small business system successful.

Here's what we have to offer:.

- Good margins
- Exclusive territories
- A small business nucleus of application software at no *charge* to you
- Excellent client accounting software, also at no *charge*
- A multi-programming, multi-terminal system that is *fully* expandable
- AJ field service available in selected areas of the United States
- Floppy or hard disk systems

If your are interested in being a part or AJ's successful future, call or write Bob Reed, National Marketing Manager, for more information.

Once you compare THE SPOOLER you can't afford not to call us.

THE BENCHMARK RESULTS ARE IN! We now have comparisons of THE SPOOLER with competing enhancement systems for DOS and DOS/VS.

THE SPOOLER vs. POWER/VS:

- 35% increased THRUPUT
- 33% fewer CPU cycles
- 82% less Virtual Memory
- 61% smaller Working Set
- And it ran COMPLETELY VIRTUAL.

The following are results from a comparison of 40 features found in enhancement systems:

System	No. of Features	% of total
ASTEC	13	33%
GRASPVS	22	55%
POWER/VS	15	38%
THE SPOOLER	37	93%

Compare. Call us for details on how THE SPOOLER can mean 10% to 100% INCREASED THRUPUT for you. You can't afford not to.

Computer Science Group Seeks Curriculum Reaction

J. Daniel Couger On Education

The working report on curriculum for an undergraduate program in computer science has been released for comment by the Association for Computing Machinery (ACM) Curriculum Committee on Computer Science (C^{3}S).

Revision of "Curriculum '68," the widely accepted model for degree programs, has been a long time in the making. The revision cycle began in July 1974. More than 50 persons provided direct input to the basic C^{3}S committee composed of: Richard H. Austing (University of Maryland), Bruce H. Barnes (National Science Foundation), Della T. Bonnette (University of Southwestern Louisiana), Gerald L. Engel (Virginia Institute of Marine Science) and Gordon Stokes (Brigham Young University).

This column will discuss the curriculum model. The next one will review the committee's recommendations related to staff and facilities.

The computer science curricula fans out from Computer Programming I and II to Assembly Language Programming, Introduction to Computer Organization, Introduction to File Processing or Organization of Programming Languages. The Assembly Language and Computer Organization courses each lead to Operating Systems and Computer Architecture I, while the File Processing course leads to one on Data Structure and Algorithm Analysis.

The computer science major consists of these eight courses plus four others, selected from a range of elective advanced courses. The committee purposely omitted a course in "Computers and Society." The reason will be explained below.

These 12 courses represent 36 of the 48 semester hour minimum requirement for the computer science major. The remaining 12 hours would be taken in mathematics.

The student begins at a very practical level and progresses to more conceptual and theoretical material. At the junior level the student program is strongly conceptual, while the senior year the program may be fully theoretical or involve a significant amount of theory supplemented with laboratory activities.

Ambiguous Math Requirements

The report appears somewhat inconsistent in its math recommendations. Page 3 states, "It was recognized in the process of specifying this core material that no mathematical background beyond the ability to perform simple algebraic manipulation is specifically required as a prerequisite to an understanding of the topics."

Page 12 says, "The interaction of mathematics with the computer science curriculum is clearly indicated by the prerequisite chart given. It is specifically recommended that all computer science students take Introductory Calculus, Mathematical Analysis I, Linear Algebra and Discrete Structures. Depending on computer science electives chosen, Mathematical Analysis II and Probability and Statistics may be required."

Engel clarified this problem: "The eight core courses could be taken as a minor in another field, independent of the math courses. Students majoring in computer science are expected to take the math courses."

Only two courses were added to the curriculum model published in 1968, according to Engel: the file processing course and the computers and society course. Contents were updated for the remaining courses.

Societal Issues Left Out

The course on computers and society was omitted from the program so that prerequisites could be simplified to admit non-computer science majors. The report states that "a mixture of majors . . . would provide broadening interchange and would benefit both computer science students and the other majors."

When asked to indicate other major changes, Engel said "the integrated approach for teaching operating systems and computer architecture is new. Also, a new way of thinking is required to combine algorithms and data structures into one course."

Special Topics Courses

The report recommends that special topics courses be offered in addition to the 25 courses identified in the program, because "the available matrial is changing rapidly." Examples of the special topics recommended for consideration in such a course are: Microprocessor Laboratory, Performance Evaluation, Telecommunications/Network/Distributed Systems, Systems Simulation, Graphics, Artificial Intelligence, Structured Programming, Software Engineering — Large Systems Design, Topics in Automata Theory, Topics in Computability, Topics in Formal Language Theory and Simulation and Modeling.

Copies Available

The 16-page working report was published in the June 1977 issue of *SIGCSE Bulletin*. Copies may be obtained for $2 each from ACM, 1133 Avenue of the Americas, New York, N.Y. 10036.

C^{3}S is soliciting comments on the proposed curriculum. They must be submitted by Dec. 1 to Gerald Engel, Department of Computing and Statistics, Virginia Institute of Marine Science, Gloucester Point, Va. 23062.

Couger is professor of computer and management science at the University of Colorado.

T/S Net Adds Foreign Data

WALTHAM, Mass. — A financial data base covering balance sheet and profit-and-loss account items for each of 2,000 foreign companies, Exstat was developed in England and is now available through the international time-sharing network of Interactive Data Corp., a spokesman said from 486 Totten Pond Road, Waltham, Mass. 02154.

DP Dialogue

Notes and observations from IBM that may prove of interest to data processing professionals.

Litton's 'Blue-Collar' Job for Finance System

At a Litton plant in Van Nuys, California, Liliane Perini enters production data, encoded on a magnetic stripe, into a terminal of the IBM 3600 Finance Communication System.

Designed to meet the diverse needs of today's financial institutions, the IBM 3600 Finance Communication System is also proving highly useful in the manufacturing environment.

At the Data Systems Division of Litton Industries in Van Nuys, California, and Lubbock, Texas, a 3600 controls the flow of materials through plants that produce command and control systems for the United States Government. The key component is the 3604 Keyboard Display. Used as a teller terminal in many banks, it serves as a data entry and display terminal at Litton.

Whenever a shop order is created, the 3604 encodes product information on the magnetic stripe of a "traveler card"—much like a personalized bank card—which accompanies the material being processed as it passes through a series of work stations. After work is completed at each station, the worker inserts the card in a 3604 Keyboard Display, which reads the encoded data, times it and enters it into Litton's IBM System/370 Model 158.

Production workers enter information at the 3604 through easy-to-use function keys, with step-by-step guidance provided by the system. Data captured at the 21 shop-floor terminals updates master files of open orders stored in IBM 3601 controllers, which act as local processors.

"The exact status of any order is available to production supervisors at any time through the terminals," says Bertram Voddon, vice president of operations. "Each night, accumulated data is forwarded to the computer in Van Nuys, where it is processed and made available the next morning in the form of production reports and analyses."

As John Lawrence, vice president of finance for the division, points out, the online 3600 system does for shop orders at Litton what it does for bank accounts at financial institutions—it makes full, up-to-date information available to authorized personnel.

"And with 9,000 shop orders active here at any one time, that's no small accomplishment," he adds. "The 3600 is keeping us on top of operations in a way that was never possible before."

J.I. Case: Super Service on Spare Parts

"We've been able to cut inventory by more than 12 percent," says Jack A. Chobanian, director of service parts supply systems at J. I. Case, one of the largest and oldest manufacturers of farm tractors and construction vehicles in the United States.

Four years ago, Case converted the management of its service parts inventory to an online computer system which it calls AIDS (Automated Inventory Distribution System).

"Even while reducing inventory, we eliminated 75% of our backorder count. Conversely, our 'fill rate'—the proportion of items delivered without backorder—improved by 8% in the same period."

Case, a Tenneco company, fills 2,000 orders a day, shipping a total of 20,000 line items from its main warehouse in Racine, Wisconsin, to ten regional warehouses and a network of distributors and dealers.

To support its broad line of current equipment models, in addition to earlier models spanning the past 35 years, the Case Service Parts Division maintains an inventory of 155,000 separate part numbers.

"We were able to cut $8 million out of inventory while increasing the fill rate because the online system gave us much better forecasting data," Chobanian notes.

"Previously," he continues, "we based our inventory projections on replenishment orders from the warehouse. Now, with order entry as an online system, we can look at accurate figures for real dealer demand."

AIDS runs on a System/370 Model 168 in Case's corporate computer center in Racine, under Multiple Virtual Storage (MVS) and Information Management System/Virtual Storage (IMS/VS). The system is accessed through 85 IBM 3277 Display Stations in warehouse and office locations.

Major online subsystems include order entry, depot replenishment, order inquiry, purchasing, receiving, forecasting and warehouse control. Under AIDS, orders received before 1:00 PM are shipped on the same day; those received later go out the next day.

"Before we installed AIDS, the division's warehouses were full to capacity just with agricultural parts," Chobanian notes. "When spares for the construction equipment line were added to its responsibilities, the division wanted to add new warehouse space. Now, with AIDS, we are handling both product lines from the same space.

"At least as important as the purely financial gains from slimmer inventories and fewer backorders," Chobanian asserts, "is the way AIDS has improved customer service. The lack of a small part, worth a few cents, for a work vehicle can stall an entire construction project at a cost of thousands of dollars a day. Similarly, a farmer's losses can be devastating if a tractor goes out of service during a harvest.

"With the online AIDS system, we're getting repair parts out where they're needed, faster than ever before. And our customers really appreciate it. We can't measure the business gain directly, but we know it's important."

AGRI KING
case

J.I. Case uses an online IBM computer to help insure that service parts are always available for farm tractors (above) and construction equipment.

Project Control Still Seen as Vital Application

• Net Adds 'Prosys/80'

WOODBURY, N.Y. – The Prosys/80 service is a project control system that integrates project scheduling, cost control, accounting, resource leveling, forecasting, performance measurement and data base management, according to a spokesman for Calldata Systems, Inc., which offers the service.

Among the graphic and tabular outputs of the service are schedules, comparison schedules, network logic diagrams, cash-flow reports and manpower leveling charts.

Users may specify their unique input, output and computational requirements while still using the system's standard algorithms, the spokesman claimed: Major items that Prosys/80 will control include time, manpower, costs, quantities and equipment needed for a project.

The system should be especially useful for projects in construction, engineering, plant maintenance and shutdown, education and manufacturing, as well as research and development and government programs, the spokesman suggested.

The facilities of Prosys/80 are available on the Calldata remote-computing network or in a software package that can be installed on an IBM 370 or many other CPUs that support standard Fortran.

On the network, the user is charged for time and resources used. The packaged version of Prosys/80 requires some 300K of main memory and a mass storage system and costs approximately $50,000 depending on modules selected, Calldata said from 20 Crossways Park N., Woodbury, N.Y. 11797.

• Cobol Base Of 'N5500'

CENTURY CITY, Calif. – The N5500 package from Nichols & Co., Inc. is described by the vendor as an efficient project management system designed to effect cost and time savings for its users. Written in ANS Cobol, it can be used with almost any modern CPU, the spokesman added.

An extension of the company's previous Procon 3 package, N5500 provides a range of capabilities including project analysis, simulation, forecasting, project costing and billing and manpower loading, he said.

Dictionary Used

The planning process supported by the package is based on a transaction-loaded dictionary, which may be easily updated, according to Nichols. Improved planning efficiency is also maintained through dynamic load leveling which feeds tasks within projects by set priorities, the spokesman noted.

Automatic resource assignments will select the individual or group that can best accomplish the specific task, and there are nine priority levels available for resource allocations, he said.

Self Starter

Also supporting and enhancing the planning efficiency provided by N5500 is an automatic project-generation facility. This allows for the creation of new projects from existing ones, bypassing all the effort usually required to establish a project under control of N5500, he continued.

The current package produces 20 reports and two output files, the latter interfacing with a graphic plotter and "any in-house system," according to Nichols.

VS Operation Best

It has been implemented in 140K in an IBM 370 environment and functions better under VS than OS, the spokesman noted. Honeywell, Univac and Burroughs sites can also install the package, he continued.

The ANS Cobol source code is available under a 35-year lease plan for $18,500, Nichols said from 1900 Ave. of the Stars, Century City, Calif. 90067.

Motorola 6800s Get FP Support

DENVER – A floating-point (FP) package and a cross-assembler with FP pseudo-operations are available from Scipro, Inc. for use with Motorola 6800 microprocessors. The basic floating-point package, FPP/6800, performs the arithmetic operations and Ascii I/O conversions, Scipro said.

An extended package also performs square root, exponential, logarithm, arctangent and trigonometric functions as well as floating-point comparisons. Three versions with 4.5, 7 and 10 digits can be selected to suit the user's applications, the vendor said.

The FPP/6800 packages are available on NS5204 and 2708 extended read-only memory chips. Custom formats and licensing for source code are available. The normal packages range from $120 to $360, according to Scipro.

The cross-assembler is written in Fortran IV and may be adapted to any computer with a minimum word length of 16 bits. The assembler accepts Motorola 6800 assembly code with additional features for forming FP constants.

The cross-assembler costs $450, Scipro said from 2600 W. Second Ave., Denver, Colo. 80219.

HASP–II GOT YOU BY THE QUEUE?
Cause You Can't Spool Print To Tape
THE HASP REPORT MANAGER
Will Solve Your Problems!!!

Panelists Agree

Networks Need User/Carrier Confidence

By Ronald A. Frank
CW Staff

TORONTO — Users must build up a "confidence factor" with their carriers when planning international data networks, according to Charles Gobeil, a former data communications manager with Chrysler Corp.

Speaking at a panel session dealing with telecommunications management at the recent Ifip '77 here, Gobeil said he wanted to dispel the idea that "the user needs a little pot of gold in his back pocket" to get needed facilities from international carriers. "This world doesn't exist anymore," he said.

Robert McEwen-King, telecommunications director for Massey-Ferguson in Great Britain, said the user has to understand the operating rules in the country in which he intends to operate. Then he should contact the telecommunications administration accordingly with requirements that are reasonable.

It is important for a company to establish local telecommunications managers who know how to deal with local problems, he added.

Provide for Standards

Users would welcome more up-to-date standards, but usually they do not keep up with technological change because of the lead time required for standards formulation and agreement, he said. In allowing for changes, users should configure networks with built-in provisions for standards and technology upgrades, McEwen-King said.

Michael Ford, head of international service policy for the British Post Office, called for faster development of standards so that users of international data nets will not have to deal with different telecommunications administrations in each country.

"The user can't continue to negotiate with 15 different bodies," Ford warned his fellow panelists. The pressure of events will force much more rapid development of standards, he predicted.

As a case in point, Ford mentioned the evolving X.7X standard for the international interconnection of public data nets, which he said should be forthcoming "hopefully within a year.

"Many monopolist telecommunications carriers are criticized for their inertia and apparent disinterest in meeting the needs of individual users," Ford told the attendees.

"It is my experience that the truth is far from this. There are groups of specialists . . . who obtain great satisfaction from providing tailor-made facilities for user organizations," he said.

Because of the need to interface with many telecommunications administrations, the necessary staff and technical resources to get into international data nets are only available to the largest users, the panelists agreed.

"I really don't enjoy operating a large network and having to deal with 15 different agencies," McEwen-King said, "but I don't think it will change very soon."

Ford said the user should not expect too much from the carriers he is dealing with. The user is in the best position to deal with the vendors involved in supplying equipment for the network. "It is normal for the user to assume overall coordinating responsibility," he added.

Arnold Scully of Teleglobe Canada agreed with this concept. "The carrier is not in a good position to coordinate data communications nets," he said. Because of the various suppliers involved, the user is in the best position to exert pressure when it is necessary, he said.

Ford cautioned that in many European countries the biggest problem often is transmitting data from the user's office to the local exchange. "Sometimes even moving to the other side of the street can make all the difference," he advised.

Because of these types of operating problems, Ford urged users to select project managers who are familiar with the environments in which service is required.

Comten Front-End Processors Replace 270X and 370X Units

ST. PAUL, Minn. — Comten, Inc. has extended its line of communications processors with a programmable front-end replacement for IBM 270X and 370X processors.

In addition, it introduced what it called an advanced software processing and control system for distributed networking applications and announced peripheral equipment for Comten processors using the software system.

Comten's 3690 communications processor is a modular, programmable unit designed to operate in medium to large networks with IBM 360 and 370 CPUs or as a stand-alone data switching system.

Up to 512 full-duplex communications channels can be attached to the 3690 through 32 modem interface modules, providing the user with an aggregate channel throughput of 15.4M byte/sec for both storage banks within the processor, according to the firm.

The 3690 supports up to eight IBM host CPUs, provides support for IBM and non-IBM terminals and is qualified for satellite communications and advanced data switching networks, Comten said.

As a front-end system, it can relieve the host CPU of many processing functions including line control, polling, addressing, code translation and error recovery, the company added.

It can also operate as an advanced network control processor, performing networking functions, message switching and global control functions under the Comten Data Switching System (DSS), according to a Comten spokesman.

The 3690 is available in five configurations, varying in the amount of storage and other options.

Switching System

Comten DSS is a network processing and control software system that enables the Comten 3650 II, 3670 II and 3690 communications processors to act as front ends, remote terminal concentrators and data switchers, the company stated.

DSS is a group of licensed program products which are compatible with and are said to extend IBM's System Network Architecture (SNA). DSS also supports user applications, allowing them to communicate with host 360 or 370 systems in a distributed processing network.

The first two releases of DSS (Releases 1 and 2) can perform applications processing at the network level and can provide multiple host access for terminals, including IBM 3270 CRTs operating under BSC control, Comten said.

Hundreds of Terminals Operating On Datapac

By Ronald A. Frank
CW Staff

TORONTO — Datapac, Canada's packet switched network operated by the Computer Communications Group of Bell Canada, is serving more than "several hundred terminals," according to Andrew McMahon, vice-president.

Datapac was given final authority to begin operations in mid-1977 and at that time there were about 10 host CPUs on the network. For competitive reasons, McMahon said he could not give the total CPUs now on the network, but they include mainframes from Honeywell, Digital Equipment, Amdahl, IBM and Univac.

The objective of Datapac is to relieve the user of the many complex networking functions which must be done in-house to operate private-line nets. As a by-product of this goal, McMahon said Datapac will strive to have total compatibility and interchangeability with major terminals and mainfames.

Host of Applications

Among the applications now on the packet net, McMahon listed banking, trust administration, time-sharing and interactive teletypewriter traffic. In the finance area, it may soon be possible to access any credit data base with any credit card, if current Canadian plans materialize, he said. In this regard, a payments system is projected for Datapac that would link not only banks but also small stores that could do their accounting and credit processing using compatible terminals.

NCR is providing a service bureau operation designed to serve small retailers that have only a few locations. Part of this service includes the NCR 721 communications processor, he said [CW, Aug. 22].

Datapac is now operational in 57 Canadian cities and in addition, Bell Canada has agreements with CNCP to serve users in areas not covered by Bell.

Discussions have been held with regard to establishing Datapac connections with similar packet nets in Europe, but right now there does not appear to be a great user demand for that type of service, McMahon said.

An interconnection between Datapac and U.S. nets such as Telenet has higher demand from users and will probably be the next goal in widespread interconnections of packet networks. The best standard for packet operation and the one which appears to have the most support from standards groups is the X.25 protocol approved last year by the CCITT, McMahon said.

Comten Unveils 370X Front Ends

(Continued from Page 23)

Both releases of the software can also perform message handling, message switching, network security, statistics accumulation and maintenance aids for isolating and correcting system problems.

In addition, DSS Release 2 can support the new peripheral equipment, including Comten disk systems, magnetic tape systems, card readers and a line printer.

Peripheral Equipment

Comten disk drives feature a storage control unit with either fixed or removable media drives.

The fixed-media drives provide storage capacities of 24M- or 48M bytes. The removable-media disk drives provide storage capacities of 150M- and 300M bytes.

The company's magnetic tape drive consists of a magnetic tape unit and controller in one cabinet, the company stated.

The Comten card readers can read 80-column cards at speeds up to 600 card/min (Model 7305); the Model 7306 can read up to 1,000 card/min.

Comten also introduced the Model 7406 line printer, which can print at speeds up to 600 line/min at a density of 136 char./line.

Prices, Availability

The 3690 and DSS Release 1 processor will be available in the first quarter of 1978. DSS Release 2 and the peripherals are scheduled to be available in the fall of 1978.

A basic 3690 will cost $92,900 or $2,991/mo.

DSS licensed programs will have monthly license fees ranging from $250 to $450, Comten said from 1950 W. County Road B-2, St. Paul, Minn. 55113.

Micom Line Drivers Eliminate Data Sets

CHATSWORTH, Calif. — The Micom 410 asynchronous line drivers are designed for short-haul, in-house data transmission at distances from one to 12 miles over twisted pair cable.

Two versions are available: the Dumb Driver and the Smart Driver. Both are designed to operate in full-duplex mode at speeds to 9,600 bit/sec.

In addition, the Smart Driver version provides Bell 113A/113B-type simulation of all dial-up handshaking sequences, the company claimed.

The Micom 410 costs $150 for the dumb version and $185 for its smart counterpart, the company said from 9551 Irondale Ave., Chatsworth, Calif. 91311.

to lease computers for less or not...

For qualifying companies, it may be possible to lease computers and peripheral equipment at rates that are well below prime.

That's why it's important for you to talk to us at General Electric Credit Corporation before finalizing any decision on financing or leasing new EDP equipment.

With over $3 billion worth of equipment on lease, we have the know-how and experience to help you arrive at the right leasing . . . or financing . . . decisions.

Because of our size, we're able to apply the same care and dedication to every transaction regardless of size. Whether it's a custom-tailored lease to acquire equipment or a National Vendor Program to help create more sales.

Our resources enable us to be in the market at all times. And we have offices nationwide . . . so, we're easy to reach . . . easy to deal with.

You'll find it makes good sense to talk to us first.

Computer Professionals...

Your career is 1/3. Your life is 2/3.

You'll all like NCR-Wichita.

We provide a state-of-the-art challenge in realtime architecture, develop network design and communication control for distributive processing in a revolutionary data processing minicomputer environment. Here you are given the chance to create and are treated as the unique individual you are. In our metropolitan location, the old west hospitality still prevails. In the midst of modern shopping centers, great restaurants, theatre groups, 52 parks, a solid school system and an opportunity for continuing education at three state universities. You can see the night sky like you have never seen it before and if you like outdoor sports, you will find this location gets your muscles working up to par. The people are friendly, the air clean, the water pure and there is plenty for all. Some of our opportunities are:

COMPILER DESIGN PROGRAMMERS

Serve as a team member for design development and testing of APL, BASIC, FORTRAN, COBOL, RPG, Compilers.

OPERATING SYSTEMS

Senior level Analyst with minimum of 6 years experience in minicomputer based interactive systems development. Responsibilities will include system architecture for an interactive system currently under development as well as being a major contributor to system enhancement for other development projects.

DESIGN AUTOMATION ENGINEER

Five years experience, scientific programming and BSEE. Develop and enhance logic simulation, test generation, P.C. layout aids and automated documentation systems.

Monitor Works With IBM 3277-2

SEATTLE – The Model 277 hardware monitor from Temco Products here is designed to capture and display the number of transactions passing through an IBM 3277 Model 2 terminal and also display each transaction's response time.

Power for the monitor is supplied by the terminal. The transaction and response time information, however, is displayed with zero system overhead, Temco claimed.

There is no increase in the attached terminal's response time because of the monitoring activity, the company added.

The 3-in. by 5-in. by 1-1/4-in. monitor has two constant LED readouts and a display reset and is attached to the terminal by internal connections.

The 277 monitor will not alter users' maintenance agreements with IBM for the 3277-2s, because none of the terminal's internal circuitry is altered, a spokesman explained.

Temco's response time and transaction monitor can also be used to monitor operator performance and costs $350, from 2150 N. 107th, Suite 110, Seattle, Wash. 98133.

Penril Has LSI Modem To Replace Bell 201s

ROCKVILLE, Md. – The Data Communications Division of Penril Corp. has introduced a 2,400/1,200 bit/sec synchronous LSI modem.

The 2400 LSI is designed for 1,200- or 2,400 bit/sec operation over two- or four-wire dedicated or dial networks.

The modem employs a four-phase modulation technique conforming to CCITT Type A or B and is on-line compatible with the Bell System 201B or C data sets and most other PSK modems, as well as the Bell 801 automatic calling unit.

It features fast synchronization for use in multistation polled networks and point-to-point applications, Penril stated.

The 2400 LSI is equipped with an equalizer that is strappable in either the transmit or receive sections, the company said.

Strap options are provided for selecting transmitter output levels, carrier detect level, internal or external clock, carrier detector response time, RTS/CTS delays and equalization, it noted

When operating over the direct-distance-dial network, automatic answer circuits enable unattended call answering when connected via a CBS or CBT-type data coupler

Built-in local digital and analog loopback diagnostic capabilities reduce the time required to localize system malfunction, Penril added A built-in test pattern generator and receiver pattern detector simplify on- and off-line testing and troubleshooting

No external test equipment is required to install or troubleshoot the 2400 LSI, which costs $795 for dedicated lines, according to Penril at 5520 Randolph Road, Rockville, Md. 20852.

Datapro Seminars Slated for Users

DELRAN, N.J – Datapro Research Corp. will offer two-day introductory and three-day advanced data communications seminars this fall!

Each course costs $425 for current Datapro subscribers and $475 for nonsubscribers and will be held in Philadelphia; Washington, D.C.; San Francisco; and New York, Datapro said

The research firm can be reached at 1805 Underwood Blvd., Delran, N.J 08075

Hazeltine puts performance into economy terminals

The Hazeltine 1500 Series—our third generation of microprocessor-based terminals—puts performance up front! Every feature you need to speed and streamline your data communication operation is available in one of three levels of performance. No extra cost options! Features include:

- Integral numeric keypad.
- Switchable upper/lower case.
- Ultra high-resolution video display—designed and built by Hazeltine; the Company that has pioneered video displays for over three decades.

Best of all, you get all this "Hazeltine Performance" at an economy price, with a nationwide network of trained Hazeltine specialists available for on-site service. Call for a convenient demonstration.

Hazeltine 1500

A new definition in conversational terminals thet includes most features usuelly found only in higher priced terminels.

Hazeltine 1510

A buffered editing terminel with e unique concept in function keys.

Hazeltine 1520

A multi-processor terminal system, with programmable peripheral controller end interfece.

Computer Professionals...

Your career is 1/3. Your life is 2/3.

You'll all like NCR-Wichita.

We provide a state-of-the-art challenge in realtime architecture, develop network design and communication control for distributive processing in a revolutionary data processing minicomputer environment. Here you are given the chance to create and are treated as the unique individual you are. In our metropolitan location, the old west hospitality still prevails. In the midst of modern shopping centers, great restaurants, theatre groups, 52 parks, a solid school system and an opportunity for continuing education at three state universities. You can see the night sky like you have never seen it before and if you like outdoor sports, you will find this location gets your muscles working up to par. The people are friendly, the air clean, the water pure and there is plenty for all. Some of our opportunities are:

COMPILER DESIGN PROGRAMMERS

Serve as a team member for design development and testing of APL, BASIC, FORTRAN, COBOL, RPG, Compilers.

OPERATING SYSTEMS

Senior level Analyst with minimum of 6 years experience in minicomputer based interactive systems development. Responsibilities will include system architecture for an interactive system currently under development as well as being a major contributor to system enhancement for other development projects.

DESIGN AUTOMATION ENGINEER

Five years experience, scientific programming and BSEE. Develop and enhance logic simulation, test generation, P.C. layout aids and automated documentation systems.

WE'RE WORTH AN EXTRA-SPECIAL LOOK...

Get in touch today

Monitor Works With IBM 3277-2

SEATTLE — The Model 277 hardware monitor from Temco Products here is designed to capture and display the number of transactions passing through an IBM 3277 Model 2 terminal and also display each transaction's response time.

Power for the monitor is supplied by the terminal. The transaction and response time information, however, is displayed with zero system overhead, Temco claimed.

There is no increase in the attached terminal's response time because of the monitoring activity, the company added.

The 3-in. by 5-in. by 1-1/4-in. monitor has two constant LED readouts and a display reset and is attached to the terminal by internal connections.

The 277 monitor will not alter users' maintenance agreements with IBM for the 3277-2s, because none of the terminal's internal circuitry is altered, a spokesman explained.

Temco's response time and transaction monitor can also be used to monitor operator performance and costs $350, trom 2150 N. 107th, Suite 110, Seattle, Wash. 98133.

Penril Has LSI Modem To Replace Bell 201s

ROCKVILLE, Md. — The Data Communications Division of Penril Corp. has introduced a 2,400/1,200 bit/sec synchronous LSI modem.

The 2400 LSI is designed for 1,200- or 2,400 bit/sec operation over two- or four-wire dedicated or dial networks.

The modem employs a four-phase modulation technique conforming to CCITT Type A or B and is on-line compatible with the Bell System 201B or C data sets and most other PSK modems, as well as the Bell 801 automatic calling unit.

It features fast synchronization for use in multistation polled networks and point-to-point applications, Penril stated.

The 2400 LSI is equipped with an equalizer that is strappable in either the transmit or receive sections, the company said.

Strap options are provided for selecting transmitter output levels, carrier detect level, internal or external clock, carrier detector response time, RTS/CTS delays and equalization, it noted.

When operating over the direct-distance-dial network, automatic answer circuits enable unattended call answering when connected via a CBS or CBT-type data coupler.

Built-in local digital and analog loopback diagnostic capabilities reduce the time required to localize system malfunction, Penril added. A built-in test pattern generator and receiver pattern detector simplify on- and off-line testing and troubleshooting.

No external test equipment is required to install or troubleshoot the 2400 LSI, which costs $795 for dedicated lines, according to Penril at 5520 Randolph Road, Rockville, Md. 20852.

Datapro Seminars Slated for Users

Datapro Reports On OCR

By Frank Vaughan
CW Staff

DELRAN, N.J. — Datapro Research Corp. here recently published a report, "All About Optical Readers," in which 85 optical mark reader (OMR) and optical character recognition (OCR) users evaluate their equipment. In addition, the report includes comparison charts listing the features and prices of 71 optical readers from 34 manufacturers.

The report examines the current technology and concludes "OCR is as mature, or more mature, than any technology in DP, and the machines have always been very reliable." The stigma or unreliability must mainly be attributed to the actions of "over-zealous salesmen" or to the "naive DP manager," it said.

Looking at the current role of OCR, Datapro observed that OCR has a definite niche within data entry operations, and the report encourages knowledge and understanding of OCR as "an alternative means of data entry."

The report also examines the reasons behind — and difficulties caused by — the lack of a "standard" OCR equipment design. It also explains why there is no such thing as the standard OCR document, what companies usually want when they look toward OCR.

For the user's ratings portion of the report, Datapro summarized and averaged responses to a survey taken in February. Equipment was judged in the areas of overall performance, ease of operation, reading reliability, document handling reliability, document design flexibility, ease of job changeover and maintenance service.

The report costs $12 from the firm at 1805 Underwood Blvd., Delran, N.J. 08075.

80% Savings Claimed

One-Step System Processes Remittances

By Edith Holmes
CW Staff

WASHINGTON, D.C. — Computer-Link Corp. introduced a one-step remittance processor at the recent OCR Users Association meeting here and promised that the stand-alone unit will reduce the payment processing costs faced by businesses by between 80% and 90%.

Called the SORC/800, the remittance processor contains Digital Equipment Corp.'s LSI-11 microcomputer with a 32K-word memory and contained communications capability.

The device is further self-contained in that it includes dual diskette drives, an interactive CRT display with 240 characters and alphanumeric operator instructions, a keyboard, an optical character recognition (OCR) scanner, a punch-card reader, an audit trail printer with 200 alphanumeric characters and a programmable check endorser, the firm said.

In one operation, the SORC/800 can process over 1,000 payments per hour at a cost of under 2 cents per payment — approximately 6 cents less per transaction than the batch remittance-processing method, the company added.

The unit can handle almost any style of multiple documents that must be simultaneously processed with fixed or variable information from a single document, including insurance premiums, loan payments, credit card payments, bank-by-mail, subscriptions, deposits, tax payments, monthly installments and mortgage payments, Computer-Link stated.

SORC/800 automatically inspects and compares the amounts of bill payment stubs with checks, reconciles the amounts and inscribes an audit trail. It endorses and separately batches both bills and checks, then produces payment records and deposit slips for transfer to the bank, a spokesman for the firm said.

The device will accept documents from 2.7 in. to 5 in. high and 4 in. to 9 in. long, as well as American Bankers Association (ABA) standard checks, and 16-pound to 32-pound paper and card stock, Computer-Link said.

Micr Inscriber

An ABA Magnetic Ink Character Recognition (Micr) inscriber required for automatic processing of endorsed checks is another SORC/800 feature.

The OCR scanner included in the device reads OCR-A alphanumeric, OCR-B, 407, 1403 Standard .095, 1428, E-7B, E-13B, E-12F, punched cards and hand print fonts, the firm stated.

Selling for between $32,000 and $37,000 depending on the kind and type of scanning required, the SORC/800 is available from Computer-Link at 14 Cambridge St., Burlington, Mass. 01803.

In-House Systems Best Choice For Fast-Growing Credit Unions

By John P. Morgridge
Special to CW

The in-house, general-purpose computer system offers a number of advantages to a large, expanding financial institution such as a credit union. Use of outside commercial service bureaus or of software houses/system builders on the other hand, has serious disadvantages for growing credit unions.

An increasing number of the nation's approximately 22,600 credit unions are studying their current and future DP needs. The business has seen an annual growth of nearly 15% per year since 1970, making it the fastest-growing segment of the U.S. banking and credit community.

As this business grows, the demand for additional member services grows even faster. Share drafts, loan drafts, preauthorized lines of credit, variable-interest-rate savings plans, 12-year unsecured loans, 30-year home mortgages, traveler's checks and money orders are now authorized, and legislation allowing unions to issue credit cards has recently been signed into law by the President.

Credit unions have three options for satisfying their DP needs: to purchase DP services from a commercial service bureau; to purchase a special-purpose system from a third party such as a system builder or software house; or to lease or purchase a general-purpose computer system for in-house use.

While service bureaus offer ease of entry to DP for smaller credit unions with no DP experience, and while third-party special-purpose systems can provide satisfactory solutions in certain situations, the in-house, general-purpose computer system offers significant demonstrable advantages for the larger credit unions.

Ease of Growth

Most service bureaus can accommodate their client's growth, but each workload increase results in a parallel cost increase. Since service bureaus itemize charges by account, transaction, report and so forth, each time the workload doubles, the service bureau billings also normally double.

Most computers obtained from software

DIABLO HY-TERM YEAR-END SALE SPECIAL
The $2595 Hy-Term*
FROM DDI, AMERICA'S LEADING TERMINAL SUPPLIER
*Model 1620-1 or a Model 1620-3 for $2795
Offer ends Dec. 15, 1977
Branch offices: New York City • Morris Plains, N.J. • Philadelphia (Cherry Hill, N.J.) • Washington, D.C. • Detroit (Southfield) • Chicago • Atlanta • Dallas • Houston • Los Angeles (Encino) • San Francisco

Favorable pricing is just one factor in the value equation which assures you your best buy comes from DDI.
With DDI, you also get:
- A single source for DEC, TI, ADDS, DIABLO, OMNITEC, TECHTRAN.
- Full range of new products.
- Choice of rent/lease/buy plans.
- Unique Combination Savings Plan.
- Nationwide maintenance service.
- Nationwide branch network for prompt response to your needs.

TEL: (203) 661-1700

In-House Route Best for Large Credit Unions

(Continued from Page 27)

houses or system builders are tailored to an assumed workload. Although some expansion ability is normally built in, when the expansion limit is reached, the credit union would need to purchase a second system (doubling its investment) or purchase a larger system and attempt to dispose of its outgrown equipment.

I recommend general-purpose computers purchased or leased directly from the manufacturer because they are highly modular. First, a user can add functions, increase capacity and even accelerate internal operations without replacing the CPU.

Second, field-installed upgrades are fast and economical. They can usually be installed between shifts.

Third, the workload can double and redouble with only moderate cost increases and without making the computer obsolete.

And fourth, even if the rapidly-growing credit union outgrows its general-purpose system, upward compatibility protects its investment in programming, applications and training when moving up to a larger system.

Software is the key to harnessing the power of the computer for constructive tasks.

The disadvantage of service bureaus is that they offer a fixed software capability. The same functions are performed the same way for all credit unions and it is difficult and expensive to modify software needs of individual users. In addition, service bureaus are unable to generate special one-time reports on demand, and new applications are limited to the service bureau's offerings.

While somewhat more flexible, specialized third-party offerings from systems houses come with limited software custom-tailored to existing applications. The hardware/software offerings are the same for all users in a given industry. Adding new applications, if possible, involves a major additional investment with the system supplier.

The User's Choice

Conversely, major computer manufacturers offer a wide selection of systems and applications software. The user has a choice of easy programming languages for inexperienced programmers or powerful languages for increasing sophistication.

The general-purpose system has extensive facilities for data management, communications with branch offices and utility functions. And new applications can be programmed in-house (with vendor assistance if you desire), obtained from a vendor or exchanged through users' trade associations. As credit unions expand, they need this easy, inexpensive access to new services applications.

The in-house system allows the user to control work schedules and priorities, avoiding service bureau drawbacks such as dependence on the service bureau's schedule and competing customers, reliance on complex communications links to large, distant service bureaus, or transportation of data to and from small local service bureaus. It also allows the user to retain its confidential files in-house where security is easier to control.

And finally, it should be remembered that large, established manufacturers have long-standing commitments to the DP industry. They offer strong financial resources and large research and development budgets for solving customer problems.

Morgridge is vice-president for General Systems Operations at Honeywell Information Systems, Inc.

NUMBER CRUNCHER

Maxi FORTRAN power at mini computer prices.

If you need heavy number crunching capabilities but your budget can't take the cost of mainframe computers, Interdata has the answer...our 8/32 Megamini® FORTRAN Processing System.

This FORTRAN system is more powerful than any other minicomputer. It has a 32-bit word length for extensive addressing and manipulation—useful for image processing and simulation. Our 32-bit word length lets you address up to 1 million bytes of memory—just the ticket in linear programming and matrix processing. There's more...floating point hardware, writeable control store, and an optimizing FORTRAN compiler.

Amazingly, this FORTRAN system is priced like a minicomputer...1/7th the cost of an IBM 370/158 or Univac 1108, the traditional number crunchers for scientific work until our 8/32 system came along. Your budget wins with appreciably lower cost per instruction.

If you have requirements or plans for large FORTRAN programs, investigate our Megamini's experience in the scientific community. Call your local Interdata office or contact me, Gary Doninger, Interdata Scientific Manager. (201) 229-4040.

Send me information on your 8/32 FPS.

Perkin-Elmer: System Integration by Design

Our design engineers spend a lot of time talking to each other. In fact, we insist on it.

Thanks to all the talk at the drawing boards, we can offer you systems that perform. At peak efficiency.

We realize that the more fully you can utilize the power of your system, the happier you'll be.

That's why we design every single product to suit the system. And every system to optimize its parts.

Perkin-Elmer Data Systems designs and builds a complete line of minicomputers from our Interdata division; mass storage devices from our Wangco division; and I/O terminals from our Terminals division. They're all designed for system integration.

Excellent price/performance. Complete software. Field-proven hardware. Integrated sales and service. Worldwide customer support. Perkin-Elmer Data Systems supplies the tools and support you need.

Give us a call at our toll-free number: (800) 631-2154. We have a lot to talk about.

370/158 Add-On Debuts

BEDFORD, Mass. — Cambridge Memories, Inc. (CMI) has introduced an add-on memory system for IBM 370/158 CPUs that reportedly increases the main storage capacity to 16M bytes.

The Stor/158-4 permits the attachment of 16M bytes of storage to uniprocessor, multiprocessor or attached processor versions of the 158 Model 1 or 3, he said.

IBM has memory limits of 4M bytes and 6M bytes respectively for the uniprocessor versions of these models and limits of 8M bytes and 12M bytes for the multiprocessor versions.

No software changes in the 370/158 are needed to accommodate the add-on memory, CMI claimed. The memory sells for approximately $110,000 per megabyte. CMI is at 12 Crosby Drive, Bedford, Mass. 01730.

3M Introduces Four Disk Packs

ST. PAUL, Minn. — The 3M Co. here has introduced four disk packs for specific disk drives.

The 934 disk pack is designed for the Burroughs Corp. B9484-4, B9485-4, B9486-4, B9489-8 and B9383-6 disk drives. With a track density of 200 track/in. and a bit density of 4,400 bit/-in., the 934 offers 8,120 track/pack and has a maximum capacity of 121M byte/pack, according to a spokesman. The 934 sells for $375 each.

The 935-0 was designed for the Calcomp 225 disk drive and the 935-32 was engineered for the Univac 8440 disk drive. Both packs offer 220 track/in. and 4,400 bit/in. providing 8,120 track/pack and a maximum capacity of 116M byte/pack. The packs sell for $450 each.

The 949/40, designed for the Control Data Corp. 9760 and Ampex Corp. DM940 disk drives, is a soft-sectored pack with 192 track/in. and 6,038 bit/in. There are 404 data track/pack and a nominal capacity of 40M byte/pack. It sells for $325 per unit, the spokesman said.

All 3M disk packs offer Crashguard disk coating which protects against damage and headcrash, the spokesman added. 3M can be reached through P.O. Box 33600, St. Paul, Minn. 55133.

Sycor 440s Get Printer Option

ANN ARBOR, Mich. — Sycor, Inc. has enhanced the peripheral flexibility of Its 440 series of distributed data entry and processing systems by enabling cable-connected serial printers to be located up to 2,000 feet from the CPU.

The "distant printer" feature allows one or two Sycor Sprinter bidirectional serial printers to be remotely cable-attached to a 440 system, according to a spokesman.

The distant printers can be field-installed by adding a special I/O feature to the 440 control unit, he added.

The distant printer option costs $500 plus the cost of the cable from the firm at 100 Phoenix Dr., Ann Arbor, Mich. 48104.

Getting and keeping timeshare business:

Remote computing services and batch service bureaus face a number of problems.

Problems which, if not solved, could mean the beginning of the end for most of them.

Maybe even your company.

Batch, but only batch.
There's no denying the demand for on-line services. (Look how some of the remote computing services have prospered.)

So there's the problem of adding a timeshare capability. At low cost, so you can offer a low-cost service. But with the capability to grow with your business.

There's the problem of security for proprietary software and data. The problem of delegating control of system resources, without losing overall control. The problem of accounting for system use—especially use of added-value software. And the problem of knowing what is happening anywhere in the system, at any time.

Solving these problems could make you successful in timeshare as well as batch.

Remote, but losing business.
For remote computing services, keeping customers is often the biggest problem.

After a time, many customers begin to feel they're putting out too much money for your service. They check out your competitors. Or think about an in-house system.

Finding a way to extend your services downward in cost could turn your biggest problems into even better customers.

Small, or just starting out.
You may already have a small timesharing company. Or you're planning to start one. Your first problem is finding a computer you can afford. One that's also a real timesharing computer. With the management features the big timeshare computers offer.

Solving this problem could make your small company a big success.

Problems solved here.
These problems you're facing in your firm, timeshare or batch, large or small, can be solved with the computer made by us:

Basic Timesharing, Inc. We're the computer manufacturer with timeshare experience. We understand the unique problems of your business.

And that's what has helped us produce a computer so uniquely right for the timesharing business.

The BTI 4000 Interactive Timesharing System.

A remote computer's computer.
The BTI 4000 was built from the drawing board up for timesharing. To maximize operational capabilities. To minimize operating costs. To give you more.

You can start for just $35,950. For that you get a ready-to-go system with 10 megabytes of storage and 8 ports—just add terminals.

You also get BASIC-X, an unusually powerful extension of the BASIC user language, enhanced for business programming.

You get hierarchal account organization, allowing you to "sublet" portions of the system. Which lets you earn income without overhead, while still maintaining total control.

You get protection for your proprietary software that allows *you* to sell systems with your software on them—and still keep your software proprietary.

You get continuous system availability, because software housekeeping can be performed with users on-line.

You get room to grow, because the BTI 4000 is a modularly-expandable system. Add disk storage to 400 megabytes; expand user capacity to 32 ports; add peripherals like industry-compatible magnetic tape and a line printer.

And you get around-the-clock, on-line support for all your systems, no matter where they're installed.

The BTI 4000. To help you get more timeshare business, and keep the business you have.

Get the complete details today.

The BTI 4000 Means Business.

Basic Timesharing Inc., Headquarters: 870 W. Maude Avenue, Sunnyvale, CA 94086. Sales Offices: East: Cherry Hill, NJ (609) 662-1122; Midwest: Minneapolis, MN (612) 854-1122, Chicago, IL (312) 298-1177; West: Sunnyvale, CA (408) 733-1122, Anaheim, CA (714) 533-7161

For Better Patient Care

Minis Facilitate Prescription Control

MONTREAL — Three minicomputers linked to several micros at remote locations are helping RX Information Center Ltd. here provide better patient care, according to the user.

The DP center was formed to acommodate the needs of Jean Coutu Pharmacies, a retail chain; Farmic, a pharmaceuticals distributor; and Casgrain and Charbonneau, manufacturer of pharmaceuticals and medical supplies, The minis are located at Casgrain and Charbonneau's head office here.

The system provides on-line prescription retrieval and creation at each pharmacy as well as on-line receipt/labels with directives for each prescription entered. Drug allergy warnings, doctor look-up and verification and comprehensive renewal controls are also provided.

The system also keeps a patient history of prescriptions, allergies and drug interactions as well as personal patient data. Automatic pricing and production of welfare and other government reports is also provided. Along with this, the system provides a comprehensive business program for the pharmacies' accounting and statistical applications.

"To expect any supplier to accommodate these requirements, I had to provide a comprehensive request for proposal," Robert Dionne, General manager, said.

After months of analysis and then subsequent evaluation of all proposals, Dionne made his choice. "I was looking for the best price/performance in hardware, but not having my own programming staff, I also needed either a software subcontractor or a supplier who would be totally responsible," he said.

Cygnet Minicomputers Ltd., a Montreal-based minicomputer vendor, was selected for the complete hardware and software implementation. Knowing full well that this was a specialized system and it would be difficult to project terminal response times, Dionne insisted on hardware and software performance guarantees before the work began. A maximum four-second response time was specified.

Paperwork Cutbacks

Now that the system is running, RX expects to cut costs and time in the paperwork side of prescription processing and to improve customer service. Prescriptions are prepared through a microprocessor-controlled visual display with a Centronics Data Computer Corp. 306C printer attached.

The data base at the central site retains all prescriptions for a period of two years (inactives are automatically deleted from the system). Patient profiles and prescription re-

Mini Bits

Meet to Explore Office Automation

SAN FRANCISCO — A conference for those considering combining word processing and DP in their offices will be given by the American Institute of Industrial Engineers (AIIE) in two cities this fall, winter and spring.

The first day will include a survey of functions and systems of the automated office, the organization said. On the second day, concurrent workshops will examine word and text processing technology and systems and DP, software and communication technology trends influencing office automation equipment. They will also cover selected case studies.

The conference will be given here Sept. 28-30 and in Washington, D.C., Dec. 7-9 and March 13-15. It costs $265 for AIIE members, $295 for nonmembers and $195 for teams. Information is available from the organization at P.O. Box 3727, Santa Monica, Calif. 90403.

Floppy Gets Bootstrap Loader

SANTA CLARA, Calif. — Data Systems Design's DSD 210 Digital Equipment Corp. compatible floppy-disk system has been enhanced with the introduction of a hardware bootstrap loader.

The bootstrap capability allows a DEC PDP-11 or LSI-11 user to load RT-11 from the diskette unit with a single command. The bootstrap instruction sequence is contained on a programmable read-only memory which is a part of the DSD 210 interface, the firm explained.

The DSD 210 including the bootstrap feature is available 30 days after receipt of the order and costs $3,295, the firm said from 3130 Coronado Drive, Santa Clara, Calif. 95051.

Printers Interfaced to PDP-11

AUSTIN, Texas — Houston Instrument has interfaced its 8200 series line printers to Digital Equipment Corp. PDP-11 minis through the use of a DEC Unibus compatible interface and cable, the firm said.

The interface mounts in a four-slot wide card position in the mini. It contains all the logic and hardware necessary to control the printer and respond to the Unibus commands, according to a spokesman.

The interface option costs $1,150. The 80-column 2,400 line/min 8210 printer costs $3,450 and the 132-column 1,400 line/min Model 8230 printer costs $3,785, the company noted from One Houston Square, Austin, Texas 78753.

Small System Tracks Beer, Wine

By Esther Surden
CW Staff

GRAND RAPIDS, Mich. — Wine and beer, although similar in alcoholic content, are quite different when it comes to keeping track of orders and inventory.

This, combined with the increasing complexity of a business that must abide by tough state and federal regulations, prompted Kent Beverage here to seek help through purchasing a small business system.

The firm is a beer and wine wholesaler with about 560 accounts, according to its president, Larry Gary.

"Wine is usually a presell inventory, which can be kept on the computer. The system generates a picklist and the wine is directed to the correct customer," according to Kevin Gary, general manager in charge of the small system.

Beer is a direct-sale item so it is necessary to keep a truck inventory log over age of a consigned item. The beer salespeople make direct sales and receive cash. After the cash is brought to Kent headquarters, it is counted out manually and the resulting numbers are input into the mini via a CRT terminal. The system cost-verifies the amount and prints out a sales analysis, Gary said.

Increasing complexity in the alcoholic beverage business prompted the firm to look for a small system, the general manager said. "There are a huge number of laws wholesalers have to follow. For example, we have to keep seven years of data storage and you can imagine the size of the data file."

Both Garys looked at several systems before choosing their present model, Keven Gary noted. Cascade Data, Basic Four Corp., Litton, Burroughs Corp. and IBM all were contacted, and the company looked at several on-line service bureaus. "But I was not satisfied with any of the programs," Gary said.

He explained he was looking for an application package that would completely take care of his problem. The general manager had taken several computer courses in college and knew what his firm needed in a software system.

Finally, the wholesaler contacted a neighbor who happened to be a distributor for Randal Data Systems, Inc. The neighbor's firm, Minicomp Systems, Inc., was willing to write the basic programs and Gary decided to write the rest, using his

(Continued on Page 33)

Definitions Sort Out Chip Memory Functions

BOSTON — Almost everyone in the computer industry would agree that minicomputer memory technology is changing rapidly. No sooner did the mini move from core to large-scale integration technology with its plethora of read-only memory (ROM), programmable read-only memory (Prom), random-access memory (RAM) and erasable programmable read-only memory (Eprom) chips than it began looking toward charge-coupled devices and bubble memories on the horizon.

Where are we today? Bogged down in a quagmire of acronyms and buzz words, with even the most sophisticated user seeking a simple explanation for these abbreviations. In response to several reader requests, CW is presenting a few of these definitions as they appeared un a catalogue designed for hobbyists and compiled by the Computer Warehouse Store.

Memory can be grouped into two major categories — read-only memory and read/write memory (misnamed random-access memory). Both categories of memory are actually random-access; that is, any address may be immediately accessed.

ROM — The process for making ROMs requires the creation of an expensive mask, but copies of the ROM are themselves inexpensive. This means that for large volumes the ROM is ideal.

Any ROM is nonvolatile; that is, it keeps its memory contents even when the power is shut off. This makes it extremely valuable as a bootstrap for setting a system started from a power-up condition. It is also used extensively in the simple monitors that permit a user to examine, modify and run programs in memory. The user may not change the contents of the ROM.

Prom — This is a special memory which can be programmed using electrical means. It does not require the expensive mask process but, once programmed, it performs exactly as an ROM. It is reasonably inexpensive in small quantities and makes a good memory for low volume systems.

Eprom — As the name implies, this is a Prom that can be erased and reprogrammed. It costs more than the Prom, but with the capability of being erased and used over again, it may actually be cheaper to the hobbyist or during system development.

RAM — The microcomputer always needs some memory that it can alter to maintain data. For certain applications, the amount of RAM memory may be extremely small, perhaps only a dozen or so bytes for a dedicated instrument or simple process-control system. Other applications may need tremendous amounts of read/write memory, thousands of bytes, to hold both programs and data.

The advantages of RAM memory are that it can be modified by the computer and it can hold data and programs. The disadvantages are that it is more expensive than the ROM types of memory since it requires write circuitry as well as read circuitry, and it is volatile; that is, it loses its contents when power is turned off or is seriously interrupted for a brief duration.

Minis Expedite Prescriptions

(Continued from Page 31)

cords are retrievable by the prescription number or by a combination of surname and birth date. A prescription is accessible, regardless of where originally created, by any drugstore in the network.

One print cycle produces the label for the vial directions, a three-part customer Medicare receipt, a laboratory file copy and a cashier's stub. The construction of the form alone, with hardware modifications to the printer, took Dionne, Centronics and Paul Finlayson of Cygnet V.P. Systems three months to complete.

Communications Lines

The network extends from Montreal east to Sherbrooke, north to Lac St.-Jean, west to St.-Jovite and south to Valleyfield. Polled multidrop, private and Dataroute 1,200 bit/sec telephone lines are used for communications.

Central-site hardware consists of four identical Cygnet Series 2002 minicomputers. Three are used as prescription CPU, management CPU and communications CPU. The fourth is redundant and serves as backup to any of the others.

Disk Drives

Disk drives are 300M-byte Ampex units dual-channeled to the prescription and management CPUs. Failsafe procedures have been implemented through a magnetic tape audit of all transactions processed during the day.

"In fact," Dionne said, "with the redundant hardware plus the fact that two CPUs can handle the total requirements with only a degradation in response, we have the ultimate in backup security."

Three hundred line/min, OCR-A-font chain printers serve the government welfare reporting. Reports are prepared during the evening and forwarded to the individual pharmacies on a daily basis. The average number of prescriptions processed daily by a pharmacy ranges around 500.

How to jump into key-to-disk, without giving up your

Granted, key-to-disk equipment does good things for data preparation in high-volume applications.

However.

This is one big jump that is best accompanied by a little foot-dragging. Because, in your enthusiasm for the things key-to-disk can do, you may forget what it can't do: read and punch cards.

And the punched card is still very much alive. Particularly as a turn-around document. But the useful unit record is also a pain in the processor for most key-to-disk systems. Leaving you with an awkward I/O problem, and possibly some dissatisfied using departments, too.

But what can you do? Hire, and train, two staffs of operators? One for keypunch, the other for key-to-disk? Double up on equipment? Establish two different work-flows?

Don't.

Instead, call us. Ask to see one of our key-to-disk-compatible interpreting data recorders. It works *with* your key-to-disk system to give you multi-media capability. You can use it for I/O. Or flip a switch and slip into off-line keypunch mode. Each unit combines keypunch, verify, interpret and reproduce functions so you can have a lot of scheduling flexibility without getting a lot of machines.

The best of both worlds? Why not? Use the coupon to find out just how easy it is, or call 800-523-5948.

Efficient ID System

Bar-Encoded Labels Simplify Librarians' Duties

By Joyce Kamanitz
Special to CW

NEWTON, Mass. — Although bar-encoded labels have run into problems in some applications [CW, May 30], they are well-suited to library applications.

In fact, libraries across the U.S. and Canada have been using bar-encoded label's since 1972 to identify their patrons and books.

Promptly dubbed "zebra labels" by the librarians, the labels help the library's minicomputer turnkey system keep track of the books in each collection and prepare reports on the collection's usage.

The system works as follows: Every library patron receives a zebra label on his library card that uniquely identifies him to the system. Each book also has a zebra label attached to it.

To perform a checkout, the librarian simple reads the patron and book zebra labels with an optical scanner to make the connection between the two for the duration of the loan period. For checkins, the librarian scans the book's zebra label and the system removes the connection.

Behind the scenes, the system checks for conditions that formerly took hours to determine, if they were checked at all.

For example, by identifying the title connected to the zebra label, the system can tell if any holds have been placed on a book presented for checkin.

If so, the system notifies the librarian and the book is set aside to be picked up by the next patron who has requested it. The system then sends a notice to that patron informing him the book has been returned.

Library staff and patron reactions have been very favorable because this combination of minis and bar codes makes checkout and checkin faster and more efficient. Scanning the patron's zebra label instructs the system to examine the patron's borrowing status. Thus, the librarian knows immediately whether the patron requesting a book has exceeded the library's delinquency thresholds.

The librarian then determines whether to allow the patron to check out the book, thus rewarding borrowers who follow the rules and warning those who don't that privileges may be denied.

Without the on-line access to the data base facilitated by the zebra labels., the librarian does not have the patron's borrowing status readily available.

As part of each checkout, the system updates the circulation count for the type of patron and the type of book in the transaction. Librarians thus determine the types of books being circulated and the level of usage by patron groups. With these statistics, the librarian can ensure that the library purchases the kinds of books its patrons want to read.

The first part of the patron and book zebra labels is a library code. When the librarian scans a zebra label, the system always knows the branch at which the patron is registered and the branch which owns the book.

In library systems that honor branch libraries' cards, this feature enables the system to automatically keep track of the number of checkouts to patrons of cooperating libraries and to immediately identify any books erroneously returned that belong to other branches.

Bar-encoded labels in the library application have not run into the problems facing other applications, notably the supermarket systems.

Since item pricing is not an element of normal library transactions, objections based on item pricing do not apply.

Kamanitz is a technical writer with CL Systems, Inc., a turnkey library system vendor in Newton, Mass.

System Tracks Inventory Flow

(Continued from Page 31)

computer training. "I realized that no one really had a package for beer and wine distributors, so price dictated that we get this system," he said.

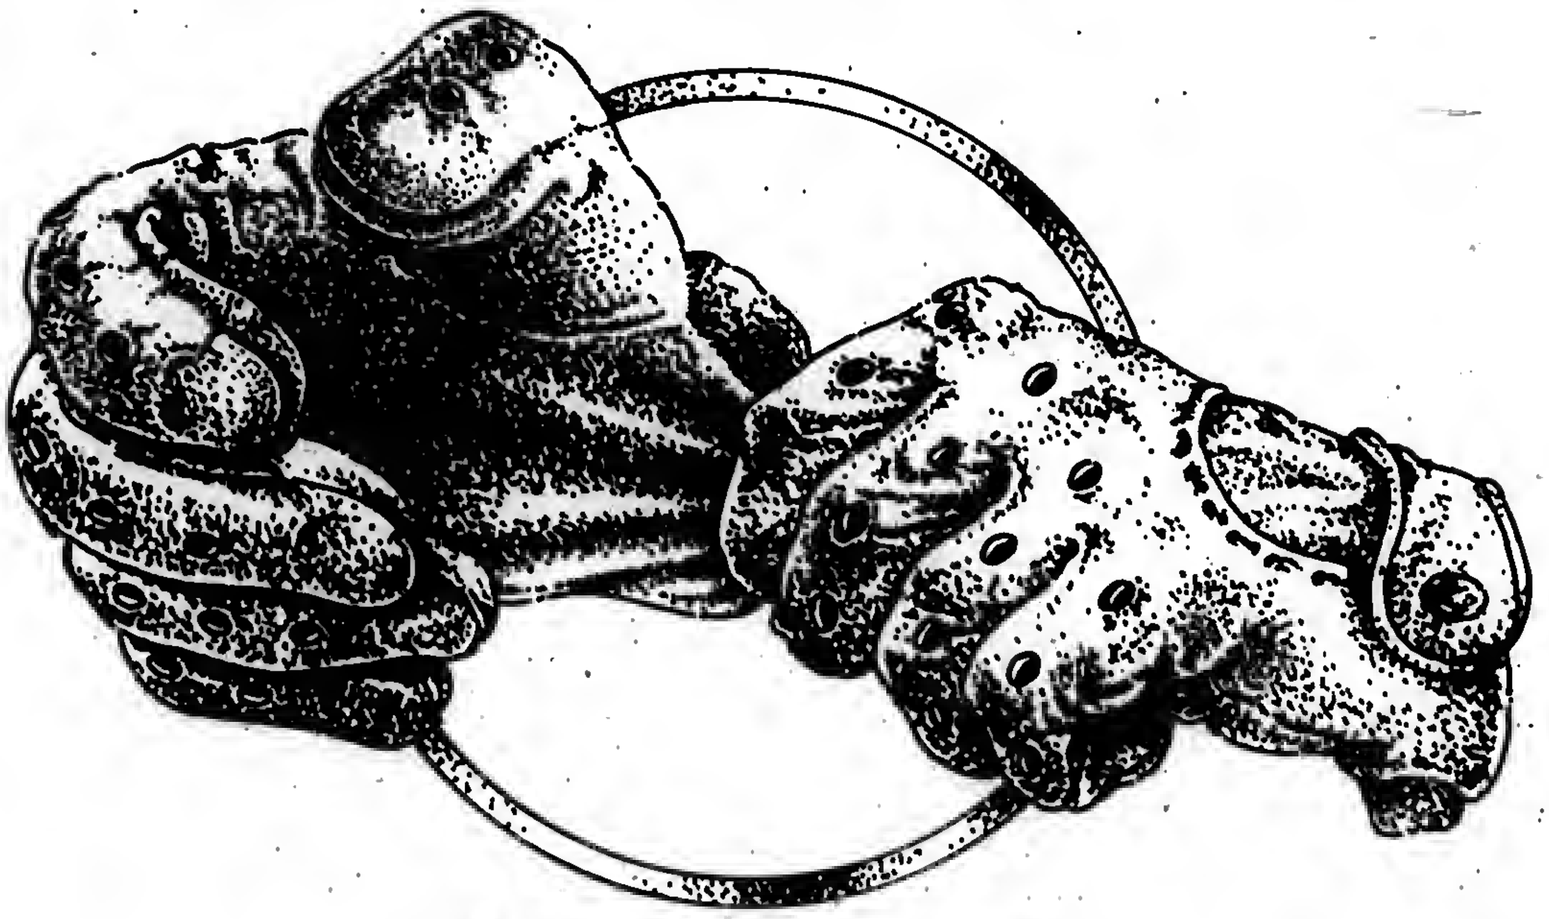
The system includes a 70 line/min printer and floppy disk. Although one CRT is presently used on the system, Kent has another on order and has decided to switch to hard disk for more capacity. The switch requires a CPU upgrade, he noted. Initial cost was $17,000.

The firm doesn't have a hardware maintenance contract with Randal, Gary noted, because he chose to do all the maintenance himself. "The Randal equipment is as good as any other piece of hardware. Downtime has been only 1/4%," he stated. The only problem the firm has had was a burned out printer motor. "Service is fantastic — we get spare parts the next day."

Because the system is located in a high dust area, "I installed our own filters around the compressor," Gary noted.

He programmed the system in Randal's Basic, which includes some variances that make the language simpler to use in writing programs, he said.

Data Base/Data Communication



The Perfect Fit from Cincom Systems

"Data base and data communication software must go 'hand in glove' to realize their maximum contribution to an organization's information system plan."

This statement is heard over and over again from the *successful implementors of complex, on-line systems.* It certainly is logical! Yet...we still see the occasional disappointed user who has violated this principle and attempted to get by with the old interface approach.

Cincom's performance-oriented solution to this DB/DC requirement is to "perfectly fit" the strong "hand" of the *TOTAL Data Base Management System*...serving nearly 2000 customers worldwide ...with its fully integrated "glove," *the Environ/1 Data Communication System.* The on-line results of such meticulous tailoring include:

Optimum Performance and Efficiency
- Self-optimizing core management.
- Fully re-entrant COBOL-XT application code.
- Conversational programming.
- Multi-threaded operation.

Maximum Flexibility
- Operating system independence.
- Terminal device independence.

Comprehensive Integrity and Security
- Automatic logging, backup and recovery capability.
- Concurrent update protection.
- Dynamic task sign-on and dispatching.

Ease of Use
- Batch to on-line programmers in hours.
- Off-line program testing and simulation.
- Debugging aids and statistical analysis.
- On-line data collection and editing options.
- On-line application program maintenance option.

These state of the art capabilities, coupled with Cincom's international support organization, have made TOTAL and ENVIRON/1 the modern DB/DC choice for many of the world's most progressive companies.

If you are evaluating data base, with immediate or future data communications requirements, Cincom would like the opportunity to show you the perfect DB/DC fit for your organization. We have 34 offices in major U.S. cities and worldwide.

Cincom Systems, Inc : We create efficiency.

Orderly Selection Route Ensures Best Decision

By Joseph Dresnok Jr.
Special to CW

NEW YORK – "How can we expect to merchandise in a constantly changing environment when our 'most current information' is 45 days old?" is a question asked by many small businesses.

The problems are easy to define: inaccurate sales and inventory informtion, reports so late that they are virtually useless and lack of control of the information by users head an uncomfortably long list.

Seligman and Latz, Inc., a company dealing in beauty services and products, needed to implement a solution for these problems which would serve the distribution function for the cosmetics and beauty salon products divisions, as well as provide merchandising information for the fine jewelry division. The solution had to be tailored to the varying capabilities and specialized requirements of each of the three divisions to be served.

To organize the decision process, a hierarchy was developed. After documenting "musts" and "wants" from the users, the decision hierarchy became:

- Identify the optimum mode of operation (batch, remote batch, on-line).
- Specify hardware type (mainframe, minicomputer(s), data collection devices).
- Select the communications method (if appropriate).
- Evaluate vendors and recommend one.
- Determine the organizational structure that optimizes successful implementation probability.

At each decision level in the hierarchy, top management was involved with the intent of gaining its insights and obtaining concurrence. We quickly realized that involved, well-informed corporate management would be an invaluable asset in reaching an optimum solution. Budget revisions, when necessary, became intuitively obvious to everyone involved in the decision process.

Based on the first-level decision, the minicomputer was selected as the hardware type. The necessary larger mainframe would have exceeded the acceptable cost limit and data collection devices could not satisfy the on-line requirement selected in the prior decision level. A cost evaluation to corporate management detailed the reason for the decision to use minicomputer capability.

The communications mode selected was 9,600 bit/sec leased lines on the basis that the number of sites is limited and the transaction volume is high.

The minicomputer vendor evaluation became the most difficult part of the investigation. Again, "musts" and "wants" were identified, this time by the management level of the MIS department. "Musts" included the following:

- Ansi Cobol capability to maximize in-house programming capability with a minimum of retraining.
- Data base file handling techniques to optimize the access and utility of data by the users.
- Single source responsibility from the CPU manufacturer to limit the "finger-pointing" anguish to the CPU vendor and the telephone company.

RFP Questionnaire

An RFP was developed which included a hardware and a software questionnaire. Sent to seven major vendors, one submitted a "no bid" and one exceeded the acceptable cost limit (which was now broken down by hardware, system software and applications software.) Of the five remaining vendors, only two were able to meet the "musts." The final evaluation was performed on the basis of two separate rating schedules.

The final decision in the hierarchy was to determine the best organizational structure for implementation. Based on our environment and the importance of timely installations, the project team approach was selected.

It is important to note that many of the alternatives that were not selected were reasonable and would have offered many advantages. In retrospect, we are pleased with our decision and have received the endorsement and cooperation of top management.

Dresnok is director of systems at Seligman and Latz, New York, N.Y.

THE MATCHMAKER

Very little stands between your mini and the disk drives of your choice.

Just Telefile's little Matchmaker disk controller. With it, we can put your minicomputer together with *any* of the latest 3330-type disk drives: Ampex, Memorex, CalComp, Control Data, or Diablo. You'll have a system no one else can match.

Greater flexibility.

Special tailor-made, compatible interface modules make changing minicomputers a snap.

To change drives, simply switch circuit boards. Capacity can grow from 13.3 million to 1.2 *billion* bytes per system.

Interface software included.

Telefile even provides handlers that make the Matchmaker software transparent to the operating systems of most major minicomputers.

Unmatched features.

Telefile's Matchmaker controller brings to minicomputer users the latest large mainframe disk technology with such features as: *Search and read command* to help you with data base management. *Write protection* to the sector level. And *Advanced error recovery* techniques.

The Matchmaker even comes with a separate maintenance module for offline disk pack formatting and test exercising.

And Telefile stands behind the system not only with hardware and software, but with nationwide service support in major metropolitan areas.

Write for our authoritative book.

100 fact-filled pages on the universal Matchmaker concept including operation, functional specs, features, diagnostics, installation, and maintenance. Get it free by writing: Telefile Computer Products, Inc., 17131 Daimler St., Irvine, CA 92714. Or call toll-free (800) 854-3128. In Calif., (714) 557-6660.

Small Processors the Answer

Firm Uses Net to Solve 'Saturation' Problems

By David Langley
Special to CW

VANCOUVER, B.C. — In 1974, Finning Tractor and Equipment Co. had a critical DP problem.

The company, a heavy equipment dealer, maintained a parts inventory worth $15 million — some 250,000 different line items — at full service branches and depots throughout British Columbia and the Mackenzie Valley region of the Northwest Territories, from the Canadian/American border to the Arctic Ocean. Processing 3,300 orders per day and servicing such a vast territory caused a formidable logistics and DP problem, specifically for DP manager C.A. Harris, who recognized the "saturation point" had been reached on the company's Honeywell 2040-A batch processing system.

So the task of investigating the DP solutions to this problem was undertaken. Front-ending the Honeywell system with a communications processor, perhaps a minicomputer, was one of the first avenues explored, but the ensuring operational upheaval and software conversion diminished the attractiveness of this approach. The Honeywell solution at that time was also limited to fewer terminals than the 100 — both CRTs and line printers — that Finning wanted.

A second approach was a traditional "upgrade" one, and large-scale processors from Honeywell, IBM and Digital Equipment Corp. were evaluated. However, Harris felt this route would merely establish another "saturation point" further down the road and was not sufficiently flexible to accommodate a variety of future plans. Neither proposal adequately addressed the problem of on-line system reliability, he said.

The eventual decision was that a network of small processors coupled with the appropriate software tools would provide the most effective solution and at a fraction of the cost of a large mainframe system. Data General was selected as the primary supplier (DEC provided the remote terminal printers) primarily Harris said, because of the price/performance characteristics of the Eclipse and Nova processors and the availability of an extensive data base file management system, Infos.

Experienced Design Team

The major supplier having been chosen, Harris then established a special "computer systems design group" to develop and maintain software products to support the envisaged network. Doug Dyment, former vice-president and software designer for Data General Canada, is manager. Another senior member is Michael Haines, former Data General systems programmer. This group, building on their experience, provided a "margin of safety" that practically ensured the success of the most critical portion of the project, Harris stated.

The network currently utilizes 29 processors, six of which communicate over a DG high-speed data channel link installed at the central site in Vancouver. These local processors — two 256K-byte Eclipses (C330, C300) and four 64K-byte Nova/3s — are used to support the data base, most application programs, training and develop-

Mini Acquisition Seen Serious Step

By David Hyatt
Special to CW

The process of acquiring and implementing an effective business minicomputer does not have to be quite as mysterious as users have been led to believe. Justifying, selecting, manning, installing and converting to a business minicomputer can be a manageable experience.

One of the most abstract and most difficult questions to answer is: "How do I know if I need a business minicomputer?"

One important, practical way to know is if the competition is automating and is able to underbid the company on contracts; then maybe a business minicomputer can help.

Business minicomputers are designed prinicipally to serve the business DP needs of small companies. In addition to their use in small companies, low-cost business minicomputers are also being used in some of the nation's largest corporations for:

- Local processing for branch offices or divisions.
- "Dedicated" applications such as accounts payable.
- "Intelligent terminal" applications as part of a data communications network.

Feasibility Study

The process of investigating, selecting and installing an in-house business minicomputer, if done carefully and correctly, will be time-consuming and costly. Therefore, don't take on these activities lightly and casually. A wrong decision can virtually ruin the internal administrative functions of the organization and have serious financial consequences as well.

As part of the feasibility study, the user should survey the available equipment from appropriate computer vendors that are likely to be able to satisfy the requirements. The user will probably find out there are a number of different approaches to solving the same problem.

One vendor may offer magnetic striped ledger cards as a method of data storage. Another vendor may say that ledger cards are a thing of the past and too slow and offer magnetic tape cassettes as an alternative.

Obviously, there are pros and cons to each. For example, while ledger cards are slower than tape cassettes, they do offer an immediate history of an account. On the other hand, tape cassettes can be sorted in various ways.

The first step in the process of investigating any new computer is to perform a careful audit of current operations and all the procedures taking place now. Time should be spent on defining reporting requirements, specifying application areas, determining data volume and identifying time constraints.

Typically, a variety of minicomputer representatives will be more than willing to make "surveys" of the present accounting functions. There's nothing wrong with accepting their offers, as long as the user recognizes their obviously biased viewpoints.

While investigating the present workload is essential, another very important element to investigate is any future DP requirements of the company. The system should provide some growth capability.

In order to get serious with a vendor about obtaining equipment, the user must have a proposal. In order to obtain proposals, the user must document his needs in a Request for Proposal (RFP) after the careful analysis of the workload and preliminary survey done earlier.

After receiving the competitive proposals, the user should evaluate them with four objectives in mind: Is the proposal complete? Is the information valid? List any questions and sum-

32-Bit Word Machines May Dominate Future Market

By Jean J. Bartik
Special to CW

Several years ago, when CPU hardware was the major consideration in the overall cost of a computer system, the short word length made sense. The short word length meant less hardware, thus less cost.

Today, however, the CPU hardware represents an ever smaller portion of system cost — overshadowed by the cost of memory, peripherals (big disks and fast magnetic tape) and software.

The traditional limitations of minicomputers — narrow address space, small maximum memory capacity, low precision and limited instruction set — were largely related to the short word length. These limitations gave users considerable grief when most programming was done in Assembler language.

This is no longer true. Most programming today is done in a higher level language — Fortran, Cobol, PL-1, APL, Basic, RPG-II. Furthermore, the short word length (and its problems) in the popular older minicomputers is largely hidden from the user behind large amounts of software.

The OS-8 operating system and the hefty software it supports make the 12-bit word length of Digital Equipment Corp.'s PDP-8 irrelevant for most users, who are concerned only

By James A. Harper
Special to CW

DENVER — When corporate headquarters of Johns-Manville Corp. (J-M) cut the time allowed for monthly accounting closing processing from 12 work days to six for its European operation, a new DP solution had to be found.

That solution combined extensive use of minicomputers with a time-sharing service bureau.

The J-M European operations, located outside of Paris and including the Middle East and Africa, began using a service bureau in France in the late 1960s to do payrolls, sales and sales reporting and cost of sales for the UK, France, Germany and Italy, as well as general accounting for the UK and France. The operations experienced significant growth, added new facilities and the business became more complex.

The service bureau facilities could not respond to the needs of the production people nor to the increasing demands made by marketing or finance. The final blow came when corporate headquarters here in Denver cut the time allowed for monthly accounting closing processing.

Assumptions, Objectives Compiled

An information systems program was established in 1974 and began with my arrival in Paris on May 1. Our first task was to interview management at all levels to determine how they ran their business, what information they considered critical in the running of their areas of responsibility and what they felt the future would bring in terms of their responsibilities.

The system objectives were to provide all levels of division management with the information they determine to be necessary to plan, control and measure the activities within their responsibility in the most timely manner.

The service should gracefully respond to new demands for information or response requirements, resulting from growth, organization change or newly defined requirements. It should be independent of location, i.e., capable of serving all J-M European locations requiring services without penalizing by cost or turnaround time a location situated remotely from the DP facility. In effect, the service must give every location equal access to DP in terms of cost and response.

Also, it should be flexible enough to respond to the diverse requirements of different locations, for example, interactive response vs. batch or scheduled, seven day, 24-hour service where required without cost penalizing those who don't need that high a response.

We also wanted to provide corporate headquarters, in a timely manner, with the data necessary to consolidate division performance with corporate data and the information needed to evaluate division performance.

Corporate departments, such as accounting, auditing, etc., as well as division management located in the U.S., needed to have access to management information equal to the access provided locally in Europe. Compatibility with corporate data wherever possible had to be ensured.

Two Information Needs

To do this we characterized demands for information into two categories: operating information and management information. We further characterized operating information as that information needed to conduct day-by-day business.

For the latter type, which was relatively constant rather than cyclical, we deployed minicomputers. For management data, which we defined as cyclical (monthly accounting closings, monthly operating reports) where demand for computer resources and people would fluctuate widely and where the recipients could be more than 5,000 miles apart, we opted for GE's

For Distributed Net

In-Depth Study Leads Insurer to Minis

By Esther Surden
CW Staff

HARTFORD, Conn. — Fireman's Fund Insurance Companies of San Francisco recently went through an in-depth selection process before it chose minicomputers for a distributed processing application, according to Mel Duraeo, vice-president of the Computer Services Department.

Speaking at a recent seminar here, Duraeo described everything from the firm's philosophy toward selection to the methods used to arrive at the final choice — Computer Automation's (CA) Syfa systems — in a distributed processing network.

The firm, which has three IBM 370/168s at a central site, also has 49 branch offices, 45 of which are now automated. The Computer Services Department has total responsibility for what equipment will be selected and when it will be installed. It interfaces with the Value Analysis Department, which is part of the controller's office, Duraeo explained.

"The user is kept completely out of the selection process and so are the applications people. In a lot of cases, the applications people end up having to design systems that fit our hardware. In a lot of cases, we are significantly ahead of the applications area," he said.

Duraeo pointed to cost as a very important but not the most important factor in selection of equipment. Fireman's Fund is more interested in maintenance capability, especially for "minicomputers that are going to be distributed to dispersed locations," he said.

Terminal Troubles

Originally each of the branch offices was supplied with GTE Information Systems Novar terminals, described as typewriter-like terminals with a cassette.

"We had significant problems with the vendor," Duraeo stated. "When the vendor became very interested in helping us they did not have the resources to help us. I actually sat in a meeting with design engineers, maintenance engineers and software people and within a space of two hours got seven different answers to one technical question on how something worked," he said.

When replacing the Novars the company did an exhaustive study including a thorough analysis of whether it should stay with the non-intelligent terminal or whether it should go to minicomputers. After it settled on minis, phase I and phase II requirements were defined.

For Phase I the firm required a system that would perform data entry and editing batch store and forward, as well as process over night, transmit the output store it on disk and print. Phase II included all the Phase I capabilities plus concurrent batch processing online to the host and local data base processing inquiry and update, he said.

"At that time we concluded that our users were not ready to use the Phase II facilitiies," Duraeo explained. Because the Novar equipment had been very labor intensive "we were willing to pay more for the computer hardware in order to reduce people cost." So for Phase I, which was to last an estimated 18 months, the company took a short contract with Four-Phase Systems, Inc. for a data entry system.

Although the company experienced some problems during the development cycle with the Four-Phase systems in general, it found "Four-Phase to be very good people. Maintenance has been great, uptime has been in the 99% plus range and management is extremely responsive," Duraeo said.

Although the firm hoped to stay with the same vendor for Phase II, it found it impossible because Four-Phase had operating system and hardware problems, Duraeo said.

"They had built-in problems in their operating system in handling multiple applications and we spent a significant amount of time helping to correct those problems for the future," he added.

By the time Phase II was ready for implementation, "we were really quite delighted that what we were calling Phase II had already been given a name by the computer industry. It was 'distributed processing,' " Ben Bevis, assistant vice-president, said.

Phase II began in March 1976, about four months after the Four-Phase systems were installed. "The selection process culminated in November of

When we plant a terminal...

It gets as much TLC as Marilyn gives her potted Spathiphyllum.

Terminals are just as sensitive as plants so it's important to pick the right one for *your* job. That's why Trendata offers a wide range of printing terminals and magnetic tape recorders to fit any number of applications.

And since terminal productivity stems from proper training, Trendata field reps make sure your people understand all the do's and don'ts of terminal operations.

Should maintenance problems arise, they are immediately pruned out by our own nationwide service people. The last thing you need is a terminal withering on the line.

As we mentioned, anything that grows needs TLC . . : and if your system isn't getting Terminal Loving Care, we'd like to cultivate a little conversation.

AN APPLIED MAGNETICS COMPANY

Comparative Data Can Be Misleading, Costly

By Jon David
Special to CW

The truth, the whole truth and nothing but the truth. The philosophy behind this oath required of witnesses should be applied in considering a minicomputer system.

The typical head of a smallish company, say a company in the $2 million to $20 million range, is normally a good businessman. However, today, many businessmen are still unqualified to make effective technical evaluations in the minicomputer area. They frequently choose unworkable or very poor systems because they cannot distinguish meaning from data.

The easiest area in which to compare computer systems is hardware. Computers have cycle times, disks have storage capacities, line printers have speeds and the like. The hardware descriptive parameters have some validity in comparing raw hardware; when buying a working system, however, the hardware statistics frequently have no meaning or, worse, are misleading.

A 15-million-character disk can hold one and a half times the data of a 10-million-character disk. What does this mean? If the system with the 10-million-character disk stores data with no waste, the 10-million-character disk will hold 10 million characters of data.

At the same time, the 15-million-character disk can be part of a system that stores data in, for example, 500-character blocks and blank fills incomplete blocks. Such a system would take 500 characters of disk to store 10 characters of data and would yield a data storage capacity of only 300,000 characters. While 15 is certainly more than 10, 300,000 is also noticeably less than 10 million.

Hardware statistics, even when true, can paint a very misleading picture.

Software Equally Confusing

The software area offers less hard data on which to make comparisons, but is equally prone to confusion and misinformation.

Let us assume two vendors offer software which sounds exactly the same with one exception: the first manufacturer also offers Isam. Obviously, the user is getting something more from the first manufacturer.

Isam is the mnemonic for indexed sequential access method. It is a method for storing and accessing data on disk. It is very useful in certain applications and even necessary in others. At the same time, however, it is quite often unnecessary.

Utilizing Isam has two side effects: the system automatically utilizes disk areas for index storage and program execution with Isam input/output is slowed down (relative to direct disk access programs). If you utilize Isam when you do not need it, you will both lose disk data storage capacity and slow down the response of your system. The Isam you got "free" can prove to be quite expensive.

Occasionally, a businessman will go beyond basic hardware and software comparisons. This is a good thing, because there are other very important areas. Unfortunately, here too, one can easily be misled.

I was recently speaking with a company that had a strong leaning to the equipment of one particular manufacturer. Since that equipment was not what I would have used, I asked the user why he so favored that particular system. He told me he felt maintenance was of prime importance and that a technical review had specifically stated that the manufacturer provided a national average response-to-complaint time of one hour.

My experience caused me to seriously doubt that statistic. Regardless of the validity of it, however, mean time to respond is not mean time to repair, and national averages do not reflect specific local performance. As a matter of fact, I happened to know a user in the same area who had systems from this particular manufacturer and had had equipment down for periods of three and two months the preceeding year.

The proliferation of comparative review documents and the plethora of computer

Buy The HP
Don't Get Caught
And The

The rock? That's your shiny, new HP 3000/II computer. Full of promise. Ready to do great things. Probably a very wise buying decision on your part.

And the hard place? Well, that's another place altogether. The place you're at when you discover that, all of a sudden or somewhere just down the road, you have large disc needs and a high ticket system that can offer only small disc solutions.

Needless to say, the hard place is no place to be.

Microcomputer Systems Introduces The MSC-1677. A Disc System With Big Capacity, High Reliability and Super Savings:

Our MSC-1677 is a high-power, low-cost hardware combination that delivers all the mass disc storage you require to keep your HP 3000 working and profitable. Part I of this attractive subsystem is our own super-sophisticated MSC-1000 disc controller, a product of advanced microprocessor-based technology—and a product field proven to be the most reliable and maintainable in the business.

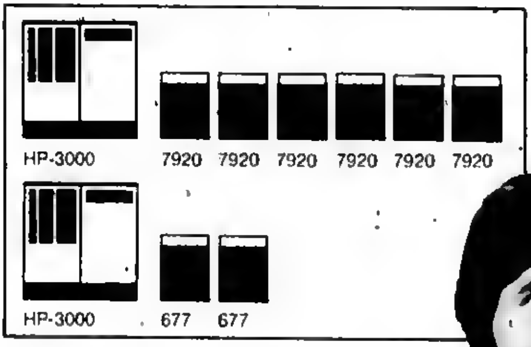
Part II is Memorex's impressive 677, a 200 megabyte disc drive that boasts a track record of over 15,000 successful installations. Together, these parts form a package that is totally hardware/software transparent under MPE—and totally superior to the disc package HP offers with the Series II.

Sometimes, Two Rocks Are Better Than One.

We know what you're thinking. Single-source systems, particularly Hewlett-Packard single-source systems, can make one feel very warm and cozy. But warm and cozy can turn uncomfortable and unprofitable in a hurry. Because it doesn't make a lot of sense to pay for the security if the system doesn't deliver the storage you need. Particularly when you can get both the security *and* the storage by working with us and our working partner, Memorex Corporation—like HP, a rock to be reckoned with.

Memorex, long known as the "memory/excellence" people in the IBM-compatible marketplace, has helped us make the HP 3000 a sensible, reliable, cost-effective alternative to IBM mainframes. Perhaps more than anyone else, Memorex has "written the book" on the successful installation of disc subsystem add-ons. They have, in large measure, shown the way in making "mixed vendor" systems preferable instead of just tolerable. They've done it with support—before, during and after the subsystem installation.

But most of all, Memorex has done it with the product.



Sometimes, Two Drives Are Better Than Six.

Particularly if they are Memorex 677 drives. This 200 megabyte, single spindle, disc storage drive is the product of three generations of Memorex disc experience. And it is the one product that has been installed more often than any other of its kind—count them, over 15,000 units at work for customers today.

No question. This is exceptional, feature-laden hardware. But what is more important to you is this: with 150 megabytes each of usable storage, *two 677's will do the work of six HP 7920 discs.* That can mean upwards of 50% cost savings on the initial drive purchase alone. It can also mean dramatic increases in the mean time between failure. Because, over and above the proven reliability of the 677, two electromechanical devices are simply going to break down a whole lot less than six.

Your HP 3000 Will Never Know How Much You Are Saving.

Thanks to Microcomputer Systems MSC-1000 disc controller, which emulates the presence of the biggest drive

Results in 'Substantial Savings'

Independent's Language Speeds Programming

OAKLAND, Calif. — Granny Goose Foods, Inc. here, a snack food manufacturer, has converted from an IBM 370/135 to an NCR Century 151 small business system programmed in an independent vendor's programming language.

The conversion from the larger 370/135 was made to reduce all DP costs, John Barnhill, programming manager, noted. The 370 was transferred from Granny Goose to the company's parent firm — Del Monte Corp. — and replaced with the smaller system.

At that time there were still several incomplete programs that could not be run on the Century system, so the company bought time from an IBM user. This continued for some time, while the company contracted with some independent vendors to write the programs for the new system.

One of the vendors, Century Analysis, marketed a language called Pass/3 designed for the NCR Century system, Barnhill recalled. The use of the language sped up the writing of the remaining systems so much that Granny Goose opted to use it exclusively for its own operations as a means of reducing systems development costs, rather than using the NCR Century language, Neat/3.

The staff of two programmer/analysts attended a one-week Pass/3 class in October 1976 and since that time has used Pass/3 exclusively. About 60 programs have been written and put into production.

The conversion is complete, Barnhill stated, and the firm will soon begin additional development in areas that up to now had been considered projects for some point in the future.

"The time spent writing and debugging programs is greatly reduced, resulting in a substantial savings," Barnhill noted.

Using a multifunction language that can be used to write any type of program — captures, updates, reports and user-defined programs — from very limited input specifications helped speed operations. If desired, Neat/3 source listings can be produced as a byproduct of the language, he noted.

Granny's Hardware

The hardware at Granny Goose includes a Century 151 with 64K of memory, two disk drives with 30M bytes each, two tape drives, a train printer and a card reader. It is used to run 10 different accounting systems in batch mode, he noted.

Two of the three systems that were important during Granny Goose's conversion were salesmen's accounting and plant reporting. The first was a relatively simple system, consisting of 18 programs designed to keep track of commissions and inventories on a weekly basis.

After attending programming classes at the independent vendor's school, Ellen Dudley, one of Granny Goose's programmer/analysts, began writing the programs in Pass/3. In approximately two months, all areas of the system were operational, written essentially by one person.

Fewer Cards

"Every line of coding I wrote in Pass/3 would have taken much more in Neat/3," Dudley explained. "There were fewer cards to keep, creating less chance for error."

This savings can be seen in the fact that the system was written in 2,035 Pass/3 lines, which generated 12,064 lines of Neat/3.

Another system, written by Tony Flusch, is essentially a finished goods inventory, keeping track through ratios and theoretical concepts of all material and labor necessary to produce Granny Goose's existing product and providing statistical analysis for future products.

Flusch wrote all 35 programs inapproximately three months using Pass/3. His 1,541 lines of Pass/3 coding generated 16,244 lines of Neat/3.

3000 But...
Between The Rock
Hard Place.

HP can offer, the 50-megabyte 7920— without emulating either its capacity or its overall cost. To the Series II, our 677 will look exactly like *three* 7920's. This means usable capacity of 150 megabytes per spindle, with up to eight spindles (or 1200 megabytes) supportable by one of our MSC-1000 wonders. It also means that no customized, non-HP software is required to do the trick. You'll never have to worry about staying up to date with future HP software enhancements to the 3000.

HP3000 SERIES II
677
1

Disc Subsystem Comparison Chart

Feature	HP 7920	MSC-1677
Software Transparent under MPE/DS-3000	Yes	Yes
Microprogrammed Controller Architecture	Yes	Yes
Full ECC (error correction)	Yes	Yes
3330 Disc Technology	Yes	Yes
Capacity per spindle (megabytes)	50	150
Reliability	Good	Much Better
Complete Maintenance Support	Yes	Yes
Price	Competitive	Super Competitive
Number of installed spindles	Less Than 1000	Over 15,000
Operator oriented self-testing capability	No	Yes

Rock-Solid Support. Around The World and Across The Board.

You are still saying to yourself: "Sure, you have significantly more installed spindles out there than they do. And yes, simple math tells me that the MTBF on yours will be a third of theirs. And granted, I could save upwards of 50%, even 100% on drives alone. But what about once it is mine and no longer yours and something just happens to . . ."

Relax. Customer support is guaranteed. In spades. Don't forget one of the rocks on which we have built this ad. And this product. Memorex Corporation is committed to support the MSC-1677 program with its vast service organization—a sophisticated interweave of skilled people, strong technical support and a logistics network bound together for a single purpose: immediate customer response.

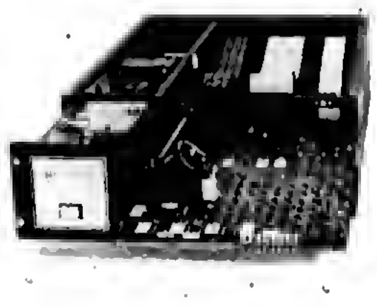
Beyond them, there is us. And our team of HP 3000 experts, backed by a fully functioning HP 3000/II System that can "acceptance test" subsystems, "systems test" spare parts, reproduce failures or anomolies so as to quickly analyze and troubleshoot problems at the system level.

Once again now, Memorex and Who?

Memorex and Microcomputer Systems Corporation. The people who forked out over three grand for this ad space because we think the MSC-1677 Disc Subsystem is something data processing decision-makers should know about. (We'd also like to sell a couple.)

In the coming months, you'll be hearing more from us. And not just in the HP 3000 peripheral add-on marketplace either. Dedicated to the continued "conception through production" development, generation by generation, of micro-programmed controllers a year or two ahead of the industry, we are already hard at work in the 317 mb and 630 mb Winchester technology arena.

Beyond our individually marketed controllers, we will continue to work with "rocks" like Memorex Corporation developing products like the MSC-1677. After all, wasn't it a rock that helped David take the steam out of a fellow named Goliath?



Call our President, James Toresnn, at (408) 733-4200, to find out more. Or write Microcomputer Systems Corp., 440 Oakmead Parkway, Sunnyvale, CA 94086.

Networking Solves Firm's 'Saturation' Problem

(Continued from Page S/2)

ment work, local branch office functions, numerous system utilities and four synchronous multidrop 4,800 bit/sec communication lines.

The remote processors (Nova/2s and Nova/3s, each with a number of CRTs and serial line printers) handle communications, local terminal editing, printer spooling, screen format storage and TWX/Telex replacement for the branch offices. These remote stations may be "down-line" loaded at any time without disturbing normal network activities.

Disk storage consists of three 92M-byte drives, one for the on-line data base, one for software development and the third for backup and data base expansion. Two 9-track and two 7-track tape drives are used for transaction logging, development and Honeywell compatibility.

Infos is the software vehicle for accessing the 600,000 record data base, but the unique nature of the system is due to its homogenous network architecture, employing a protocol of Finning's own design, Harris said. All processing functions, be they system or user in origin, run as "processes." In which CPU the actual execution of a process occurs is defined by a process dictionary, which may be dynamically modified at any time to accommodate changes in software or hardware, he noted.

This lack of CPU dependence means additional processors may be added to he network to improve performance as the transaction load increases and new application systems are added. This is accomplished without software modifications, he indicated.

Similarly, processor failures have only a transitory effect on the system; response simply degrades until the fault is rectified or redistribution of processes is effected, Harris explained. This modular expansion feature means no significant processing limits have been built into the network design. Additional processing capabilities may be added at any time the application load requires it, he noted.

In order to simplify the task of developing and maintaining the network software, Finning implemented an enhanced version of BCPL, a structured system programming language. This compiler generates multitasking code for both Nova and Eclipse processors.

Application programs are currently written using Cfor, another Finning development. This preprocessor, which generates Fortran 5 code, was created to overcome the syntactic shortcomings of Fortran, encouraged structured programming and implement "field variables," a commercial data type. Another Finning software development was M-5, a virtual memory system that provides users with a 2-byte execution space with no special programming considerations, Harris said.

'Once the initial installation problems were ironed out, performance of the DG hardware has been excellent. Retaining an on-site field service engineer has played a major role in smoothing out the operation.'

Performance Excellent

Once the initial installation problems were ironed out, performance of the DG hardware has been excellent, he said. Retaining an on-site DG field service engineer familiar with the system played a major role in smoothing out the operation.

DG's Infos, relatively new at the start, contained a number of bugs which only surfaced when the system went live and the software was thoroughly exercised. But with Finning's help, DG resolved the prolems and subsequent revisions have proved to be solid. Communications facilities provided by the B.C. Telephone Company are stabilizing favorably, Harris said.

The first and most cost-effective application to be implemented was the parts inventory system and it has been successfully on-line for six months. Personnel and account credit authorization followed shortly thereafter, with branch invoicing, TWX/Telex replacement and volume data entry scheduled for completion later this year.

Future Plans

Future plans include word-processing capabilities, a transparent link to another network designed for IBM 3270 terminals, shop floor data collection and fire-detection and access-control mechanisms for remote branch offices.

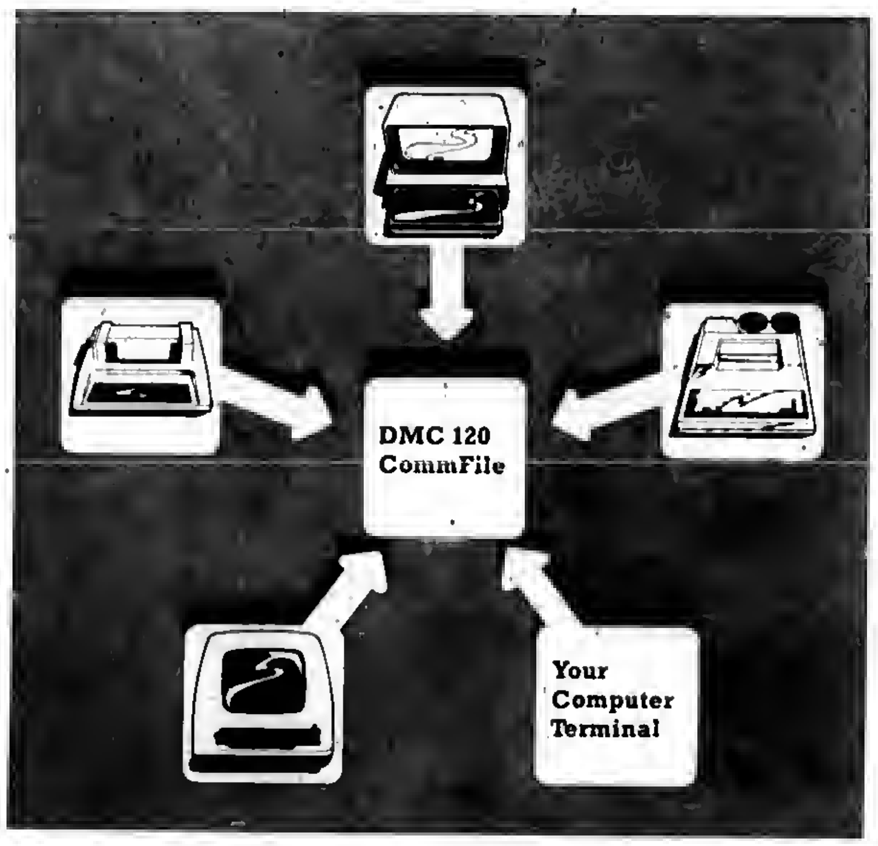
The network facility was foreseen by Finning as crucial to future operations, regardless of intital cost justification. But the economics already are favorable, Harris pointed out. Elimination of a four-day delay in customer invoicing, the return to Honeywell of now redundant equipment, replacement of the TWX/Telex facilities and the planned elimination of the off-line data entry system will "save" some $35,000 per month. Written off over the next five years, Finning's system will cost $27,000 per month, including maintenance and interest, so the initial net improvement measured in dollars alone is over $8,000 per month.

Langley is manager of computer software marketing for Finning Tractor and Equipment Co., Ltd.

DMC

We can make any dummy smart, even intelligent.

The CommFile is compatible with almost any data communication system. You can cut line costs, lower computer time, and eliminate errors in data entry and editing on **your** computer terminal.



Plug any dumb terminal into the DMC CommFile. You immediately get a powerful text storage, processing and communication system that is amazingly simple to use. With CommFile, you can:

- Collect and store text from your terminal or timesharing system;
- Do comprehensive text editing and file management;
- Communicate these files to your timesharing system.

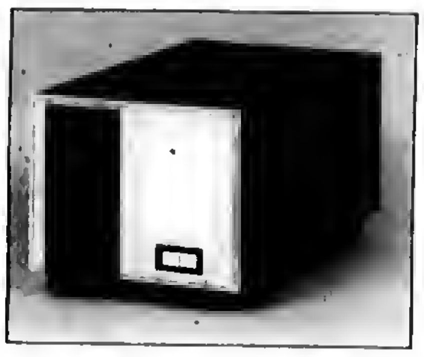
You can easily expand the basic turnkey system to a complete programmable CPU system with any or all of these valuable features:

- Up to 64K of memory;
- Up to four floppies;
- Text editor;
- Basic-Plus;
- Assembly language software;
- Word processing software for complex text formatting made simple.

Nationwide service (even for the machines you hang on) through central dispatch, toll-free.

For full information, call, TWX or write Tom Bowden at DMC. Use the coupon if you prefer.

CommFile converts your free-standing display or printer terminal into a high-speed data entry, editing and transmission station.



Even intelligent?

Tell me more about how to give any dummy instant smarts, even intelligence.

Revenues Up 8%

Mini-370 Link Streamlines Hospital Lab Work

DES MOINES, Iowa — A Control Data Corp. laboratory minicomputer interfaced to an IBM mainframe at Mercy Hospital's DP center here has helped this institution increase its revenues 8% while reducing paperwork, an official said.

The "innovative" link between the hospital's IBM 370/135 at the DP center and the laboratory's CDC System 17 was developed because "unless the laboratory computer could communicate on-line with our business computer, we felt the investment wouldn't be a significant improvement to the overall procedure," Robert E. Williams, senior assistant administrator, said.

The hospital also wanted a system that could communicate with the 370, not over telephone lines, but over a cable connection, according to Kay Wright, director of information services. To suit the hospital's needs, William Noonan, systems analyst for Mercy's business computer operations, and Thomas Miller, analyst and hardware specialist from Medlab Co., the division of CDC that designed the system, built a prototype interface.

"A hard-wired board in the CDC computer allows the IBM 370/135 to talk to the CDC system as if we were a 3277 terminal talking to the IBM system," Wright explained. Since the installation of this interface, Medlab has built others for other customers, she noted.

Easily Expanded

The hospital decided it needed a laboratory system to cope with the paper-burdened functions in the laboratory. The lab needed a system that was "easy to use and easy to modify," Wright noted. The institution also wanted a stand-alone dedicated system that interfaced with existing instrumentation and one that could be expanded to take care of applications other than laboratory work.

The two systems sit about 1,000 feet apart on different floors of the hospital. Now all patient test data necessary for billing and management reports flows between the System 17 and the IBM mainframe. During the day patient admission, transfer and discharge information is transmitted to the CDC system. The mainframe processes this admitting information entered on terminals located in admitting and emergency room areas and relays it to the CDC computer.

"Once a day, after midnight, the CDC system sends all charge-in data over the same cable back to the IBM computer. This procedure takes about 15 minutes," Wright noted. "There has never been any problem with the system due to the cable or interface," she added.

The hospital believes in an integrated approach to data processing, so the laboratory, hospital officials and the DP department were all in on the design of the system.

"It is important to the success of any new procedure that the participants know 'why' they are performing a certain function," Wright said. "This accumulative understanding, or lack of it, can have a decided impact on the operation as a whole. Consequently, anyone who would have contact with laboratory test data was included in the training."

As personnel became familiar with the new procedures, it became apparent that the computer-based system was having a positive impact on the laboratory's work flow.

"Manual recordkeeping and the amount of paper 'floating' around the lab have been eliminated," Victor Pound, manager of the laboratory computer, noted.

"At both ends of the testing process we are experiencing smoother work flow and a quieter environment. Retrieving test records — once a frantic paper search — is now done by querying the display terminal in the laboratory," he said.

Use of the Medlab system begins well in advance of the actual recording of test results. First, the mini formats docotor's test orders that it reads from mark sensitive cards.

The printout is a "call for collection" or work sheet which lists patients' names, identification number, type of test and volume of specimen needed and the attending physician. This printout is delivered to the nursing units prior to 7 a.m. and is used by nursing personnel to verify which patients will have lab work during the next 24 hours.

A second printout made at the same time is on adhesive labels which technicians attach to the specimen bottles as they make the collection. Patients' names on the adhesive labels are automatically arranged by the computer acording to a convenient "route" through the hospital to save technicians time as they collect specimens.

Back in the laboratory, the technician verifies on the display terminal that the specimens have been collected and are available for test.

To expedite laboratory schedules, the system then produces a list of all similar tests. As each test is completed, the results are automatically relayed to the system and put into the proper patient record there. The technician uses

(Continued on Page S/22)

When you buy disk systems from us, you get a lot more than just high-performance hardware...

At System Industries, we take great pride in translating the latest disk storage technologies into high-performance hardware. But by itself, superior hardware would not have made us the world's largest independent supplier of minicomputer disk systems. Equally important have been the people behind the hardware.
